CO., No. 4 Broad street, New York.
[clip out and return this notice.] 10v16-3m**SILVER IN GEORGIA.**—A Gainesville cor-
respondent of the New York Stockholder
says: "I have opened a vein of argentif-
erous galena from 5 to 10 feet thick, and
yielding from \$10 to \$60 per ton of silver
and from \$5 to \$50 of gold. One assay
reached \$2,176; from twelve assays the
average was \$44, excluding that of \$2,176.
The vein has been opened out 20 feet at
three points 100 yards asunder, at one of
which the sulphurets are iron. It is nearly
vertical in micaceous slate that dips (south-
east) 40 degrees. The range of the assays
is higher than from the celebrated Comstock
Lode, which varies from \$15 to \$40, with
occasional flights to \$500 and \$2,000. But
the cost of working their ore is about \$16
per ton. This can be mined for \$4. There
miners' wages are \$5 per day, here \$1 to \$2.
There wood costs \$16 per cord, here \$1.50,
and everything in proportion. The pros-
pect is very favorable for this section being
rich in silver. The predominant rock is
granite, gneiss, micaceous and talcose slates,
accompanied with hornblende, steatite, ita-
columite, etc."**ASPHALTE FOR ROADS.**—Asphalte was in-
troduced into Paris in 1854, by M. Mom-
berg. The asphalte used is a natural com-
position of pure carbonate of lime and
bitumen, or mineral tar. The bituminous
limestone is crushed into powder, and af-
terwards heated to a temperature of about 140
degrees centigrade. It then remains in a
state of fine dry powder, somewhat similar
in its consistency to molder's sand, and in
this form it is employed in the streets. The
roads to be paved are first covered with a
layer of concrete made of cement, and this
layer is carefully dried before the applica-
tion of the asphalte cover. The asphalte
powder is then reheated and spread over
the surface of the concrete in an even layer
of about four centimetres, or one and three-
fifths of an inch in thickness throughout.
After this the powder is well rammed and
compressed by means of heated cast iron
rams, worked by hand. This being done,
a heated roller, weighing about four cwt.,
is passed over it, and is repeatedly traversed
over each short length of pavement newly
rammed in. Two larger rollers of sixteen
cwt. and two tons respectively are after-
wards employed in flattening down the
whole. The pavement is ready for use two
or three hours after the first roller has been
passed over it.—Iron Age.**SPEED ON ENGLISH RAILWAYS.**—The fast-
est train in England is on the Great West-
ern Railway. It travels every day 194
miles, with four stoppages amounting to 20
minutes, in 4½ hours, or at the rate of 43
miles an hour. The greatest exceptional
run ever made in Great Britain was in 1862,
when the answers were brought to the dis-
patches sent to Washington respecting
Messrs. Mason and Slidell. The train from
Cork to Dublin ran at the rate of 41 miles
an hour. The mail steamer from Dublin
reached Holyhead at 8:15 in the morning.
At 8:28 the special train left London and
performed the whole distance in exactly
five hours, or at a speed of 52½ miles an
hour—a speed unparalleled for so long a
distance on a line crowded with traffic. By
means of an invention for supplying the
tender with water from a trough in transitu,
the engine ran 130 miles without polling
up to take water. This is the longest run
ever made by any engine in the country
without stopping. In France the fastest
trains do not exceed 34 miles an hour; in
Belgium, 34½; in Prussia, 31½.**THEORY OF METALLIC DEPOSITS.**—The
following is a paragraph by Prof. T. Sterry
Hunt, in 1861:—"The metals of the Que-
bec group seem to have been originally
brought to the surface in watery solution,
from which we conceive them to have been
separated by the reducing agency of or-
ganic matter in the form of sulphurets, or
in the native state, and mingled with the
contemporaneous sediments, where they
occur in seeds, in disseminated grains,
forming fuhbands, or, as at Acton, Canada,
are the cementing material of conglomer-
ates. During the subsequent metamor-
phism of the strata, these metallic materi-
als being taken into solution by alkaline
carbonates or sulphurets, have been re-
deposited in fissures in the metalliferous
strata, forming veins, or ascending to higher
beds, have given rise to metalliferous veins
in strata not themselves metalliferous. Such
we conceive to be, in a few words, the the-
ory of metallic deposits; they belong to a
period when the primal sediments were
yet impregnated with metallic compounds,
which were soluble in the permeating
waters."

SHEFFIELD CUTLERY.—A writer in *Harper's Magazine* for March, speaking of a visit to the show-rooms of the Sheffield Works, notes the effect of the sudden pass from the making of armor plates for ironclads to a room where were seen twelve perfect pairs of scissors, all together weighing exactly half a grain. The writer thus proceeds:—"Sheffield has hardly another sight so fascinating as these show rooms. Here is a little foathery steel flower, whose petals are blades; and there a knife whose handle of carved ivory is a foot long, which holds a whole set of surgical instruments, and 95 blades adorned with American views—a knife made for the Exhibition of 1861 at a cost of £966. The most curious knife, perhaps, was one containing 1,867 blades—a new one being added every year. The handle is already a foot and a half high."

All About Sending Money by Mail.

RATES OF COMMISSION.—The following are the rates charged (in currency) for transmitting money to any part of the United States:

On Orders not exceeding \$20.....10 cents.
Over \$20 and not exceeding \$50.....25 cents.
No fractions of cents to be introduced in an Order.
United States Treasury Notes, or National Bank Notes only received or paid.
To send over \$50, additional Orders must be obtained.
Post Offices where Money Orders may be obtained will furnish blanks as follows, which the applicants will fill out:
No. Amount Date,, 188 ..

MONEY ORDER.

Required for the sum of \$.... Payable at
State of Payable to Residing at
Residing at State of Sent by
Entered in REGISTER:

Names of parties and places, and the sums, to be written in the plainest possible manner.
As there are several places of the same name in the United States, applicants must be careful to indicate which of them they mean; and the Postmaster will satisfy himself, before writing out the order, that the place indicated is the one intended.

Important to Californians.—Many inventors have lately had their claims for Patents seriously (and in some cases fatally) delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. This Mining and Scientific Press Patent Agency has strictly complied with the regulations of the Department, and properly filed all necessary papers as Claim Agents.

Mechanical Drawings.

Persons wishing Mechanical Drawings can obtain the services of competent draftsmen, by applying to this office

THE CELEBRATED Self Generating Portable Gas Lamp.

This extraordinary Lamp produces its own gas by the vaporization of Petroleum, Naphtha, or Benzine. It emits neither smoke nor smell, and burns with a pure white flame, equal in intensity to an ordinary gas burner, and at an expense of from one to three cents per hour only, according to the quantity of light required. It is peculiarly adapted for mining purposes, also for stores, factories, billiard rooms, and, in fact, for all purposes where regular gas is not available, and for which it is an admirable substitute. As an outdoor light it stands unrivalled, burning with undiminished brilliancy in a strong wind.

Directions for Use.

Charge the reservoir with the prepared fluid, or with Benzine, from half to three-fourths full; allow a portion to run through into the cup, then turn off the tap and ignite the fluid, which will heat the burner sufficiently to generate the gas, which will be seen issuing from the top. The tap must now be turned on, and a steady light will be maintained till the whole of the contents of the reservoir is consumed.

A small needle, bent at the point and fixed in a holder, may be occasionally required to clear the minute hole through which the gas issues, and the regulating screw at the bottom turned a little back; but care must be taken not to force the screw too high, and it should never be used to extinguish the light—by turning the tap off, it will gradually go out.

When necessary to renew the cotton which is placed in the lower pipe to prevent the too rapid flow of the fluid, the lamp should be placed in a vise and the burner screw off the burnt cotton must then be withdrawn, and a fresh piece of stout cotton rag, one inch wide and four or five inches long, should be doubled over a piece of wire, and inserted into the pipe—the ends cut short off, the burner again screwed on with a little white lead, and the lamp is ready for use.
Manufactured solely by JOHN J. HUCKS, original proprietor. Factory, North Beach, San Francisco; and for sale by his agents in every city and town throughout the State. 1516-3m-8

THE GOLDEN ERA.

Founded in 1852, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent.

THE GOLDEN ERA

Is the most universally popular of all the Weekly journals. It presents forty-eight columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected matter. It is a welcome guest in Cottage and Cabin; the favorite at the fireside in city and country; the most useful, agreeable and altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe and elsewhere. Every household in the mountains and valleys, the cities, towns and mining camps of California, and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor. Inspired with the genius of the age, it is progressive, and aims not so much at distinction as a newspaper, as at honorable success in its capacity of a great Moralizing and Improving Influence. Exercising a positive power for good, and wielding a permanent influence, many able and eminent writers choose its columns as a means of communicating with the public. No effort will be spared to make it a thoroughly Californian newspaper, and worthy of the support of all classes of our citizens.

7v16-3m No. 606 Battery street, near Jackson, S. F.

To Mine Owners.

THE SUBSCRIBER, HAVING HAD MANY YEARS EXPERIENCE in Mining and doing business connected with Mining Operations, offers his services to parties wishing to purchase mines, to examine and report upon them, to buy, report upon the titles of any mine offered for sale, and to transact any business connected with mining operations in this District. Also, he would take the Superintendency of the affairs of a Mining Company. Refer to proprietors of Mining and Scientific Press. Address,
JAMES DELAVAN,
Lone Pine, Inyo Co., Cal. 4v161f

RAILROAD MATERIAL.—Few of our readers are probably aware of the immense amount of railroad material which is now arriving or on its way to this port. Our wharves have been almost constantly covered with such material for the past two or more years. There are now nine ships, almost entirely loaded with railroad iron, engines, cars, etc., on their way to this port, and three others loading in New York. In addition to the railroad fleet proper, the regular liners are also arriving with large quantities of railroad material. Good grain freights will soon await the return of these ships.

A CHALLENGE INTENDED.—Jules Jurgensen, the renowned Swiss manufacturer, whose watches command \$300 and \$400 in this country,—while those of the American Watch Company, equally good in every respect, will bring less than half that price,—is to be challenged to competition upon his own ground. The company above named intends to establish a branch manufacturing factory in Berne. So says the New York correspondent of the *Bulletin*.

THE CIRCULATION OF THE PRESS, already extensive, is rapidly increasing, and substantial tradesmen who can profit by widely disseminating information of their business amongst the most intelligent, industrial and commercial classes of the Pacific States and Territories, will find no more effective or economical medium for advertising.

DEWEY & Co., Proprietors.
Patent Agency and Job Printing Office, 605 Clay Street, San Francisco. Jan. 1, 1863.

Economy in Advertising.—The MINING AND SCIENTIFIC PRESS is the best and most economical mining advertising medium in this city. Our terms are less than one-half the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The Press contains, proportionally larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

ELECTROTYPE CUTS, ENGRAVINGS, Etc.—Our Job Printing Office is abundantly supplied with elegant engravings, ornaments, and other embellishments to suit the various branches of industry in this State.

Pacific Mail Steamship Co's STEAMSHIPS FOR NEW YORK, JAPAN AND CHINA.

LEAVE WHARF, CORNER OF FIRST AND BRANNAN STREETS, AT 11 O'CLOCK A. M. OF THE FOLLOWING DATES, FOR PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from PANAMA FOR NEW YORK.

On the 6th, 14th, 22d and 30th of every month, Steamer leaving San Francisco on the 6th touches at Manzanillo. All touch at Acapulco.

Departure of the 14th is expected to connect with the French Trans-Atlantic Co's steamer for St. Nazaire, and English steamer for South America. Through tickets can be obtained.

Departure of 14th is expected to connect with English steamer for Southampton and South America, and Australia, and P. R. Co's steamer for Central America. Through tickets can be obtained.

The following Steamships will be dispatched on dates as given below:

April 6th—GOLDEN AGE. Capt. E. S. Farnsworth, Connecting with HENRY CHANCEY, Capt. Gray.

April 14th—SACRAMENTO. Capt. Wm. H. Parker, Connecting with OCEAN QUEEN, Capt. Bradbury.

April 22d—MONTANA. Capt. J. M. Cavalry, Connecting with RISING STAR, Capt. Conner.

April 30th—COLORADO. Captain W. E. Smith, Connecting with ARIZONA, Capt. Maury.

Cabin passengers berthed through. Baggage checked through—100 pounds allowed each adult. Medicine and attendance free.

These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.

Through Tickets for Liverpool by the Cunard, Inman and National Steamship Lines, can be obtained at the office of the P. M. S. Co., San Francisco, where may also be obtained orders for passage from Liverpool or Southampton to San Francisco, either via New York or St. Thomas—if desired an amount of \$10 to \$20 will be advanced with the above orders. Holders of orders will be required to identify themselves to the Agents in England.

The Steamship CHINA, Capt. Geo. F. Lane, will be dispatched April 1st, at 12 o'clock, noon, from wharf, corner of First and Brannan streets, for YOKOHAMA and HONG-KONG, connecting at Yokohama with the steamer COSTA RICA for SHANGHAI.

For Merchandise and Freight for New York and way ports, apply to Messrs. WELLS, FARGO & CO.

For passage and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorf streets.

OLIVER ELDRIDGE, Agent.

Mineral Land Law Blanks FOR SALE.

We are prepared to furnish any of the following blanks used in securing patents for lands under the National Mineral Land Act of 1866:

I. Applicants' Declaratory Statement.

AN INSTRUCTIVE BOOK!

Prof. LAYRES'

ELEMENTS OF COMPOSITION,

BELLES-LETTRES AND ORATORY

For Scholars, Teachers, Lawyers' all Professional Persons, and those of Common Education, who would improve the Eloquence and Effectiveness of their Composition and Manners of Address.

Price, postage paid, - - - \$1.10

This is a new publication, and in style and treatment of this important subject, is original, simple, plain and comprehensive. The author, PROF. LAYRES (meritorious Teacher of good standing in California, and a sound thinker and reasoner), in his preface says: "The method pursued by the Author in developing the subject of Composition, is both the synthetical and analytical. The former is necessary to teach the theory, then latter the practice of the art; and as these are both indispensable to the scholar, so are also the two methods, as the sequel will show."

This work has lately been approved and authorized by the State Board of Education for use in the Public Schools. To further illustrate the varied and popular endorsement the book has so rapidly received, we quote the following

RECOMMENDATIONS:

It is simple, concise, and well arranged. It seems to be a work of great value.—*John Siedt.*

I am prepared to concur in the recommendation of the Honorable Superintendent of Public Instruction.—*J. C. Pelton.*

After as careful and thorough perusal of the same as it was in my power to give, I came to the conclusion that, for conciseness, correctness, and precision of definition, as well as for completeness and simplicity of style, it was, and would be, without a rival. I regard your work as the best of its kind. I know of but few men in any profession who would not be benefited by its careful study.—*Wm. H. Hill.*

I regard it as one of the best treatises upon these important branches—perhaps the only one obtainable possessing equal advantages—combining comprehensiveness with conciseness, and of such simplicity in its arrangement as to be readily understood by the advanced pupil.—*E. W. Hatch.*

It is admirably arranged to develop the correct idea of the analysis and synthesis of language, and the application of ideas into sentences and periods. The style is clear, terse and pleasing. I do not hesitate to recommend it as a great acquisition to our text books.—*James Dennen.*

I am happy to express my conviction of the value of the whole treatise. It would give me much gratification to see so thorough and excellent a treatise emanate from young California.—*Martin Kellogg.*

I recommend it to those who wish to obtain a book that will give them definite ideas on this subject, and teach them to express their thoughts and feelings in a clear, simple, and forcible manner.—*Caroline L. Atwood.*

I regard the book about to be published as far superior to any work extant upon that subject.—*Wm. S. Hunt, A. M.*

I believe the work will be a valuable and much needed addition to our school text-books.—*Herman Perry.*

You have brought the results of a profound analysis, and made them available, in a practical form.—*L. H. Brayton.*

I can recommend it particularly to my young friends of the legal profession, as a source from which they may be able to learn much of value as special pleaders and as advocates at the forum.—*John Curry.*

The subjects upon which you treat have heretofore been too much neglected in the education of young men in America. * * * Exactly calculated to interest. * * * It will soon become a necessity in every lawyer's library.—*Charles A. Felt.*

Its clearness and comprehensiveness make it easy.—*G. W. Banta.*

A gentleman of varied learning and ripe culture, who has half a dozen languages at his tongue's end. He seeks to teach the student not only how to take sentences apart, but how to construct them. His system has the merit of originality. We know of no work in which can be obtained so lucid an exposition of the elements of composition, and such valuable assistance in learning how to put his ideas into language. Prof. Layres has done the cause of popular education good service.—*S. F. Bulletin.*

This is a San Francisco book by a San Francisco author. It contains 166 pages, and is altogether creditable to San Francisco. It is simple, and meets its end in a form and style cheap and convenient, and in reach of the burlesque.—*Alta California.*

The writer, the lawyer, the minister, or the statesman, may study its rules and definitions with profit. Nothing conduces more to the purity of a national literary taste than a general and thorough knowledge of the rules by which the construction of language is governed.—*S. F. Times.*

Prof. Layres plunges at once "in media res." He seizes a sentence (which is the unit in composition, whether written or spoken), holds it up before you; tears it to pieces before your eyes—or rather, we should say, neatly and skillfully dissects it—displays one by one its several parts; makes you thoroughly acquainted with each, in its entirety; and then shows you how to put them together again. A series of such experiments, increasing in complexity as gradually that you do not feel the difficulty, and the thing is done; you are master of the subject.—*Mining and Scientific Press.*

Its design is to show that ideas can be so arranged as to increase their power; in short, to teach the mechanism of composition, eloquence and oratory. A desideratum long felt is supplied.—*S. F. Examiner.*

This is an age in which the occasions are rapidly multiplying, when educated men, and women, too, are called upon to express their views in writing, either for public or private inspection and criticism.—*Stockton Independent.*

The most eminent educators in California give it their hearty approval, and we concur.—*Maryville Appeal.*

Not only one of the best of its kind, but what is still better, one of the briefest. It contains 166 pages.—*Virginia Enterprise.*

Price, \$1.10. Sent by mail, postage paid, without extra charge. Liberal reductions made to the Trade, Teachers and Schools, ordering by wholesale. Orders received by our Traveling Agents.

Address DEWEY & CO., Mining and Scientific Press, San Francisco.

Order Bussey's Combination Burglar and Powder-Proof Keyless Lock!

REASONS WHY.

- 1st. It is the best Combination Lock known.
- 2d. It is impossible to pick it.
- 3d. It can be subjected to over half a million changes, and when run by a burglar, he is no nearer entrance than when he began.
- 4th. It has no key to lose.
- 5th. The more it is used the better it is liked.
- 6th. It has no signs, letters or figures, on its face.
- 7th. It is the simplest to understand.
- 8th. It is impossible to open it without knowing the set.
- 9th. It is least possible to get out of repair, as any one will be convinced on examination.
- 10th. It is the strongest Lock.
- 11th. No possible derangement of combination can be made.
- 12th. Amador County has adopted this Lock for its safes.
13. It received a special premium at State Fair.

Opinions of the Press and others in regard to Bussey's Combination Lock.

The Bank of British Columbia ordered the first one of these locks introduced in this city, and the following recommendation has been received by the inventor:

BANK OF BRITISH COLUMBIA,
San Francisco, May 24, 1886.

Recently, two of Mr. C. Bussey's new Patent Combination Burglar-Proof Locks were placed upon the vault doors of the Bank of British Columbia. They are found to operate with all the efficiency claimed by the inventor and in every way meet our fullest approval. They were ordered upon mature deliberation, after strict investigation of their merits, in comparison with some of the most noted and popular old styles of combination locks.

We deem the lock entirely burglar-proof. It is strong in construction, without intricate or delicate parts, with simple and easy movement. We find no difficulty in either opening or closing it, nor in changing its combinations, which may be made almost innumerable.

As a California invention of extraordinary merit, we take pleasure in recommending it to public attention, believing it to possess all the advantages which are claimed for it.

WM. H. TILLINGHAST, Sub-Manager.

We do hereby certify, that Wm. C. Bussey's Combination Lock is the best Safe Lock in existence, and impossible to be picked. We have applied several to Vaults and Safes, to entire satisfaction to parties interested.

KITTSBUE & LEAVITT,

Pioneer Iron Works, cor. Fremont and Market sts.

SAN FRANCISCO, May 6, 1887.

I do hereby certify, that Mr. Wm. C. Bussey's Combination Lock is the simplest and strongest in construction, and the least possible to get out of repair, and for Safes and Vaults in every respect as good as any other improved combination lock which I am acquainted with.

JOHN R. SIMS,

Vault Manufacturer, Oregon street.

JACKSON, April 27, 1887.

I, the undersigned, Sheriff of Amador County, do hereby certify that I am using one of Wm. C. Bussey's Keyless Combination Locks on my safe, which is made to draw four bolts with facility. I believe the lock to be the best lock ever invented, for the following reasons:

- 1st—Because it is impossible for either burglar or expert to pick it.
- 2d—The lock being constructed without a key-hole, it cannot be blown to pieces by powder.
- 3d—There is no possibility of deranging the combination by breaking off, or attempting to drive the knobs into the safe. And it is in fact the nearest approach to perfection yet arrived at in the art of Lock making.

R. COSNER.

Attested by J. C. SHIPMAN, County Clerk.

JACKSON, April 27, 1887.

The undersigned, Treasurer of Amador County, do hereby certify, that I am now using one of Wm. C. Bussey's Keyless Combination Locks. It is fastened to the outside door of the Treasurer's Safe. I have no fear of any hydra-headed gaining a knowledge of the set of the combination, when locking or unlocking the same. If I desire to have access to the safe every few minutes, I can so adjust the combination as to open this lock in two seconds of time. I am exceedingly well pleased with the same, and I deem this lock to be all that the inventor claims for it.

OTTO WALTHER.

Attested by J. C. SHIPMAN, County Clerk.

CALIFORNIA LOCK ARCADE.—A special premium was awarded Mr. W. C. Bussey, for his superior Combination Powder and Burglar-Proof Safe Lock, at the recent State Fair. We are sure no award was ever more meritoriously bestowed. This Lock was described at length in the Press several months since. At that time it was adopted by several banking houses in this city, and we are now assured that the remarkable claims asserted in favor of the Lock at that time, have been confirmed since by its practical use. We feel an interest in this California invention, and wish to see it speedily meet with the success it is ultimately certain to attain. Mr. Bussey, having properly first fairly tested his lock in California, is now desirous of introducing it in the East, and offers to dispose of the right for several States at very reasonable rates.—*[Mining and Scientific Press, Sept. 29, 1886.]*

They are the only SAFE lock ever invented. Every State and County treasury vault, and every bank and business place should have one.—*[Amador Ledger.]*

This is a lock in which a series of rotating annular tumblers is employed, and it consists in a novel arrangement of such tumblers in connection with one or more arms connected with one or more bolts, whereby an extremely simple and effective lock is obtained, presenting an almost unlimited number of combinations. For which he was awarded a special premium at the State Fair.—*[Sacramento Union.]*

We, the undersigned, practical Locksmiths, unhesitatingly pronounce Bussey's Improved Combination Burglar-Proof Lock to be the most reliable lock constructed.

F. MARKT & C. FLIKSBEL,

No. 18 Post street.

C. H. INGALLS, } Supervisors.
L. MC LAINE,

Any good blacksmith can put this lock on safe doors. Box or single old locks removed and this placed in their stead, to work one, two, three or four bolts, as the case may be.—*[See page 30 in Pacific Coast Directory.]*

A deaf or blind man can open this lock when he knows the set and understands the full manipulation, without any expert detecting the combination.

19v14:ny11414.1am

ELECTROPATHY, as a system of medical practice, is based upon the principle of electricity,—which is recognized by the adherents of the system as the organizing, animating and sustaining power in the vegetable and animal economy. It is claimed that the nervous system, with the brain as the center, is the instrument through which electricity acts. Let the condition of the nervous system be changed electrically, and there is at once a corresponding change in the manner in which the vital functions are performed. This subtle element, physiologically considered, is viewed by the school of electropathists as the connecting medium between mind and matter; and while it is not claimed to be itself vitality, it is believed to be the vitalizing power.

Dr. Rohland, who claims to have perfected the application of this element as a healing agent,—having practiced the system in the United States for more than twenty years,—has recently opened an electropathic establishment at No. 323 Kearny street, for the treatment of certain diseases. See card in advertising columns. *

THE BIG TREES.—Messrs. Sperry & Perry have had a section of the trunk of the prostrate monster "Original," sawed and photographed. Although cut at some distance from the stump, the section is twenty feet in diameter; and that, too, without its bark, which was removed some years ago and sent to London for exhibition. One of these trees,—the "Leaning Tower,"—has fallen since the last visiting season.

New Mining Advertisements.

Chilpaneca Mining Company—District of Ures, Sonora, Mexico.

Notice.—There are delinquent, upon the following described stock, on account of assessment levied on the twenty-third day of March, 1888, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Felt, E. G.	65	10	\$5 00
Mosheimer, Jos.	55	25	125 00
Mosheimer, Jos.	57	26	130 00

And in accordance with law, and an order of the Board of Trustees, made on the twenty-third day of March, 1888, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by John Middleton & Son, at their salesroom, No. 310 Montgomery street, San Francisco, Cal., on Monday, the eleventh day of May, 1888, at the hour of 12 o'clock, M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

JOHN F. LONSE, Secretary.

Office, 318 California street, up-stairs, San Francisco. a25

Stockholders' Meeting.—Notice is hereby given, that a Meeting of the Stockholders of the Globe Gold and Silver Mining Company, for the election of Trustees and the transaction of other business, will be held at their office, corner Union and Montgomery streets, San Francisco, Cal., on WEDNESDAY, the twentieth day of May, 1888, at 7 o'clock P. M. By order of the President.

J. WINCHESTER, President.

V. B. Post, Secretary.

Lyon Mill and Mining Company, Kelsey District, El Dorado County, California.

Notice is hereby given, that a meeting of the Board of Trustees of said Company, held on the twenty-first day of April, 1888, an assessment of five dollars (\$5) per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on the twenty-seventh day of May, 1888, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the fifteenth day of June, 1888, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. M. SUFFINGTON, Secretary.

Office, Room 37, New Merchants' Exchange, California street, San Francisco. apr25

Mining Notices—Continued.

Black Ledge Gold and Silver Mining Company, Lander County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-fifth day of March, 1888, an assessment of ten dollars per share was levied upon the capital stock of said Company, payable immediately, in United States Currency, to the Secretary, 223 Clay street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the first day of May, 1888, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the eighteenth day of May, 1888, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

D. H. CROWE, Secretary.

Office, 223 Clay street, San Francisco, Cal. mar28

Chalk Mountain Blue Gravel Company.—Location of Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the sixteenth day of March, 1888, an assessment of one dollar and fifty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on the twelfth day of May, 1888, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the sixteenth day of May, 1888, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. M. SUFFINGTON, Secretary.

Office, Room 37 New Merchants' Exchange, California street, San Francisco. mar21

Honest Miner Gold and Silver Mining Company, Lander County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-fifth day of March, 1888, an assessment of ten dollars per share was levied upon the capital stock of said Company, payable immediately, in United States Currency, to the Secretary, 223 Clay street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the first day of May, 1888, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the eighteenth day of May, 1888, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

D. H. CROWE, Secretary.

Office, No. 223 Clay street, San Francisco. mar28

Jo. Lane Gold and Silver Mining Company, Lander County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-fifth day of March, 1888, an assessment of ten dollars per share was levied upon the capital stock of said Company, payable immediately, in United States Currency, to the Secretary, 223 Clay street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the first day of May, 1888, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the eighteenth day of May, 1888, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

D. H. CROWE, Secretary.

Office, 223 Clay street, San Francisco, Cal. mar28

La Blanca Gold and Silver Mining Company, District of Ures, Sonora, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-seventh day of March, 1888, an assessment of two dollars and fifty cents per share was levied upon the assessable capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, No. 312 Front street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the first day of April, 1888, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the sixteenth day of May, 1888, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOS. GOLDMAN, Secretary.

Office, No. 312 Front street, San Francisco, Cal. mar28

Notice.—The Annual Meeting of the Stockholders of the NEWTON COPPER MINING COMPANY, for the election of Trustees, and the transaction of other important business, will be held at the office of the Company, 305 Front street, San Francisco, on WEDNESDAY, the thirteenth day of May, 1888, at 3 o'clock P. M.

ROBERT B. RANLETT, Secretary.

April 18, 1888. apl8

Nuestra Senora de Guadalupe Silver Mining Company, Location of Work: Tayoltita, San Dimas District, Durango, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-seventh day of March, 1888, an assessment (No. 31) of one dollar and fifty cents (\$1.50) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, E. J. Pfeiffer, at his office, No. 210 Post street, or to the Treasurer, A. H. H. ZIMMANN, at his office, No. 637 Washington street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the twenty-eighth day of April, 1888, shall be deemed delinquent and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the nineteenth day of May, 1888, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

E. J. PFEIFFER, Secretary.

Office, No. 210 Post street, San Francisco. apr

OLNEY & Co., Anchormen and Real Estate Agents, attend promptly to all business entrusted to their care in San Francisco and Oakland. Mining and other corporations will find Col. Olney well posted and thorough in transacting sales of delinquent stock. Office, on Broadway, Oakland, and No. 318 Montgomery street, San Francisco. n10

Postponements and Alterations.—Secretaries are requested to give notice of postponements, or alterations which they may desire made in their advertisements at their earliest convenience. New advertisements should be handed in as early as possible.

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the

PACIFIC FOUNDRY,
1st San Francisco.

SUPERIOR CUT-OFF ENGINES.

We desire to call the attention of Engineers, Manufacturers, and Millmen, to the celebrated

Hartford Engine,

With Wright's Patent Variable Cut-off, which we are now manufacturing under a license from the Woodruff & Beach Iron Works Co., Hartford, Ct. To parties wishing a First-class

Fuel-Saving Engine,

Simple and durable in construction, this Engine is offered in the belief that it is superior to any other manufactured. It enjoys the very highest reputation in the Atlantic States, where it is well known; over 300 of them having been built by the Woodruff & Beach Company, and being now in successful operation.

GODDARD & CO.,

San Francisco, Aug. 29, 1867.

BLAKE'S QUARTZ BREAKER!

PRICES REDUCED!

MACHINES OF ALL SIZES FOR SALE

-BY-

WM. P. BLAKE,

Corner First and Mission streets, or Box 2,077
3rd St. SAN FRANCISCO.BLAKE'S PATENT
QUARTZ CRUSHER.

CAUTION!

The owners of the Patent for this valuable machine, in order to facilitate the protection of their rights against numerous infringers, procured, some time since, a reissue of the Patent, bearing date January 9th, 1866.

This Patent secures the exclusive right to employ in Stone-Breaking Machines Upright Convergent Jaws, actuated by a Revolving Shaft.

All persons who are violating the Patent by the unauthorized making, selling or using machines in which quartz or other material is crushed between upright convergent jaws, actuated by a revolving shaft, are hereby warned that they are appropriating the property of others, and that they will be held responsible in law and in damages.

Several infringing machines are made and offered for sale in this city, upon which Patents have been obtained. Manufacturers, purchasers and users, are notified that such Patents do not authorize the use of the original invention, and that such machines cannot be used without incurring liability for damages.

BLAKE & TYLER,

Agents for the Pacific Coast.

NOTICE TO MERCHANTS
—AND—
MANUFACTURERS.

Moore's Patent Friction Hoist.

Now in successful operation in the principal stores in San Francisco, possesses many advantages over the common Hoist—viz: Greater strength; less danger in working, as goods require no slinging or lashing, consequently make fewer breakages; requires one man less to operate it; stops with the load at any point, without any fastening or attention from the operator.

The undersigned take this opportunity to notify all whom it may concern that they have secured, by letters patent, the application of a friction pawl, or stop, to hoisting machines, and that they will prosecute any party making or using any machine infringing upon the same.

VULCAN IRON WORKS CO.,

By JOSEPH MOORE, President.

JOSEPH MOORE.

HUNGERFORD'S
Improved Concentrators.

MR. HUNGERFORD, having been absent in the interior during the summer months, and engaged in the construction of several Quartz Mills, which have also been supplied with his CONCENTRATORS, has now returned to this city, and is prepared to answer all orders for his Concentrators, which are built either at the Miners' Foundry, in this city, or at Goss & Lombard's, in Sacramento.

Orders addressed to him at this city, by mail or express, will be promptly attended to.

MORRIS HUNGERFORD.

Constantly on hand and for sale at low prices, by
CHAS. OTTO & CO.,
Successors to Marwedel & Otto, 312 Bush st., a few doors above Montgomery, San Francisco.

Notice to Miners,
Well-Borers and Water Companies.

MR. PRAG IS NOW PREPARED TO MANUFACTURE Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for this branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi steels, of the latest improved patterns, for vessels of all classes. Also, Ship Plumbing done.

M. PRAG,

8th St. Store, No. 126 Clay street, below Davis.

Brodie's Patented Improvements

FOR THE TREATMENT OF

Gold and Silver Ores.

BRODIE'S PATENT IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:

No. 1.—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price, \$600.
No. 2.—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour, price, \$850.
No. 3.—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour, price, \$1,200.

EXPLANATION OF THE ABOVE ENGRAVING.
The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C represents the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the opening, F, which can be regulated at pleasure, so as to graduate to the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, B, moves the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Napa county, Lake District, Nevada county, and can be seen in operation at the Rawhide Ranch Mining Company's Mill, which is the following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne County:

JAMES BRODIE, Esq., San Francisco.—My Dear Sir: I give you pleasure to inform you that I have for the past three months had one of your largest sized Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which has entirely met my expectations, and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly,
Supt. Rawhide Ranch Quartz Mill.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

For the present it is not intended to grant licenses for the use of the Improved German Barrel, for a longer term than twelve months. All persons desirous of procuring, without having recourse to legal proceedings, for past infringements, or desirous of receiving letters of license for the limited period named, are requested to address as below. A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866. JAMES BRODIE, Fulton Foundry, or CHARLES RADCLIFF, Express Building, 402 Montgomery street, San Francisco.

CONSTANT GALVANIC CURRENT.—John T.

Sprague gives the following in a late number of the *Chemical News*: The bichromate of potash battery furnishes a current of great force; and its simplicity, economy, and convenience would make it preferable to the double fluid batteries, but for its want of constancy when a current of large quantity is required. Experimenting with it lately, I became satisfied of the cause of this defect. Although there may be a large reservoir of liquid, only the stratum between the plates is active,—and as no gas is being given off there is no circulation; this soon becomes exhausted, and as it is renewed merely by diffusion, can only maintain a current equivalent to the fresh supply of liquid thus obtained. I therefore used a thin beaker as the containing vessel, and placed it over a Bunsen's burner capable of maintaining a moderate circulation of the liquid; and as I expected, the battery now gave its fullest force with absolute constancy until the complete exhaustion of the exciting fluid. Mechanical stirring of the liquid, or motion of the plates, will produce a similar result; and thus by any of the various modes which may be employed, this battery can be made to yield a current more powerful than any other known form, without giving off any noxious gases, and as absolutely constant as can be desired.

NEW GALVANIC BATTERIES.—M. Balsamo

has presented to the French Academy a battery, both elements of which consist of iron, one being immersed in a solution of chloride of calcium, the other in dilute sulphuric acid, the two solutions being separated by a porous cell. The iron in the sulphuric acid acts as the positive element, and the other as negative. A constant and quite intense current is obtained by this arrangement. Another battery, termed an "electric buoy," now being experimented upon at Cherbourg, consists of a zinc plate and a cylinder of carbon, attached to a cross-piece of wood, having sea-water as an exciting liquid. Still another variety is that of M. Miergue, of Bonfark, consisting of a cylindrical cell of porous carbon, containing nitric acid, and an exterior cylinder of amalgamated zinc in a cell full of water.

ANOTTA.—Anotta is the coloring matter from a plant which grows in the West Indies, with deep green leaves, and clusters of purplish flowers, succeeded by bristly seed-pods, which are covered with a soft, sticky rind of a bright red color. It is the extract of this rind that forms the anotta of commerce. The pods are gathered, bruised, mixed with water, left for several weeks, and then passed through sieves. The more solid portion is boiled to a paste, and dried in the shade.

The coloring matter is slightly soluble in water, giving a yellow color; much more in alcohol with orange yellow; and still more in ether with a red color. Caustic alkali extracts the color of a dark orange when strong, and acids precipitate it again of an orange yellow. Oil of vitriol colors anotta first blue, then green, and lastly violet. Cold nitric acid poured over it produces no change. It is sometimes used to color butter and cheese, the coloring matter being diffused in the milk previous to the manufacture.

When anotta is used as a dye it is mixed with alkali; it is mostly used for silks; when employed for calico-printing it is generally mixed with potash or ammonia and starch. It has been also employed for cotton velvet, with one part of quicklime, one of potash, and two of soda.

THERMOMETERS.—The three thermometrical

scales which are most in use are the Fahrenheit, the Reaumur and the Centigrade. The difference between them is in the graduation of the interval between the freezing and the boiling point of water. In Fahrenheit's this is divided into 180 parts; in Reaumur's into 80, and in the Centigrade into 100. According to Reaumur, water freezes at 0° and boils at 80°; according to Centigrade, it freezes at 0° and boils at 100°; according to Fahrenheit, it freezes at 32° and boils at 212°. In England, Holland and the United States the thermometer most generally used is Fahrenheit's. Reaumur's scale is used in Germany, and the Centigrade in France, Sweden and some other parts of Europe. The scale of the Centigrade is by far the simplest and most rational method of graduation.

WOODEN SEATS are to take the place of the cushions in the street cars of New York. It has been found impossible to cleanse the latter after they have once become filthy.

(MINING SUMMARY—Continued from Page 263.)

pounds, and of the assayed value of \$31,790.98.

During the past week, Wells, Fargo & Co. shipped 8,443 pounds of assayed bullion, valued at \$288,779.78.

Trespass, April 18th: Work will shortly be resumed upon the mines in Palmira district, which have been idle for several months on account of the severity of the weather.

The main shaft of the Kentuck mine is now down 12 ft. below the sump, and the work of sinking is being prosecuted night and day.

OREGON.

The Oro Dell (Union county) correspondent of the *Dalles Mountaineer* of April 4th, says: Travelers for Shasta still throng the road. A good many are seeking their fortune by working on the ditch, at \$4 a day in water scrip.

We learn that a company propose bringing in a ditch, upon some claims about five miles from here, up the old Foxroad. Gold has been known to exist in some flats up there, and this company propose trying to see if it is there in paying quantities.

The company have got to work at Grand Ronde diggings, with a prospect of a lively camp this season.

Rates of Postage on Printed Matter to Europe and Asia.

The Post Office Department has made arrangements by which a number of European and Asiatic countries, hitherto beyond the reach of our mail communication except by letter, are brought within the range of delivery of all, or nearly all, United States mail matter. It is a singular fact, unknown probably to most persons who have not occasion to learn it by unpleasant experience, that there was a considerable region in the civilized world where an American traveler might not receive a newspaper directly from home.

Under the arrangement now completed, prepayment of postage (sometimes at high rates), is made necessary in all cases. The following official statement gives a full list of the countries—with some of which there has been regular communication—that are now included in the delivery by way of Hamburg and Bremen:

Rates of postage on newspapers and other printed matter (periodicals, etc.) sent from the United States to countries in Europe and Asia, by Bremen or Hamburg mail—prepayment compulsory:

NEWSPAPERS—MARKED AS FOLLOWS:

Bremen, by Bremen mail—2 cents each.
Hamburg, by Hamburg mail—2 cents each.
Prussia, Austria and German States, by Bremen and Hamburg mail—3 cents each.

Lauenburg, by Bremen mail—3 cents each and 1 cent per 1½ ounce.

Schleswig-Holstein and Denmark, by Bremen or Hamburg mail—3 cents each and 1 cent per 1½ ounce.

Sweden, by Bremen or Hamburg—3 cents each, and 1½ cent per 1½ ounce.

Norway, by Bremen or Hamburg—3 cents each, and 3½ cents per 1½ ounce.

Holland, by Bremen or Hamburg—3 cents each, and 1 cent per 1½ ounce.

Russia, by Bremen or Hamburg—3 cents each, and 1 cent per 1½ ounce.

Switzerland, by Bremen or Hamburg—4 cents each.

Italy, by Bremen or Hamburg—5 cents each.

Turkey, by Bremen or Hamburg—3 cents each, and 5½ cents per 1½ ounce.

Greece, by Bremen or Hamburg—3 cents each, and 5½ cents per 1½ ounce.

Gibraltar, Spain and Portugal, by Bremen or Hamburg—3 cents each, and 2½ cents per 1½ ounce.

Austria, India and China, by Bremen or Hamburg mail by way of Marseilles—3 cents each, and 9 cents per 1½ ounce.

Austria, India and China, by Bremen and Hamburg mails, via Trieste—3 cents each, and 2 cents per 1½ ounce.

PERIODICALS, ETC.

Bremen, by Bremen mail—1 cent per ounce.

Hamburg, by Hamburg mail—1 cent per ounce.

Prussia, Austria and German States, by Bremen or Hamburg—1½ cent per ounce.

Lauenburg, by Bremen mail—1½ cent per ounce, and 1½ cent per 1½ ounce.

Schleswig-Holstein and Denmark, by Bremen or Hamburg—1½ cent per ounce and 1½ cent per 1½ ounce.

Sweden, by Bremen or Hamburg—1½ cent per ounce, and 2 cents per 1½ ounce.

Norway, by Bremen or Hamburg—1½ cent per ounce, and 4 cents per 1½ ounce.

Holland, by Bremen or Hamburg—1½ cent per ounce, and 1½ cent per 1½ ounce.

Russia, by Bremen or Hamburg—1½ cent per ounce, and 1½ cent per 1½ ounce.

Switzerland, by Bremen or Hamburg—1½ cent per ounce, and 1 cent per 1½ ounce.

Italy, by Bremen or Hamburg—1½ cent per ounce, and 2 cents per 1½ ounce.

Turkey, by Bremen or Hamburg—1½ cent per ounce, and 5½ cents per 1½ ounce.

Greece, by Bremen or Hamburg—1½ cent per ounce, and 5½ cents per 1½ ounce.

Gibraltar, Spain and Portugal, by Bremen or Hamburg—1½ cent per ounce, and 2½ cents per 1½ ounce.

Austria, India and China, by Bremen or Hamburg mail by way of Marseilles—1½ cent per ounce, and 9 cents per 1½ ounce.

Austria, India and China, by Bremen or Hamburg mail, by way of Trieste—6½ cents per ounce, and 2 cents per 1½ ounce.

These charges are in each case in full to destination, combining rates between the United States and Bremen or Hamburg, and the rate beyond Bremen and Hamburg to points of delivery.

Our Patent Agency.

The PATENT AGENCY OF THE MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the Press, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and reliable agency upon this coast.

REMITTANCE YOUR LETTERS containing money addressed to us, or we will not be responsible. Remittances by Express must be in packages, prepaid. When practicable, it is best to remit by draft, or order, on some San Francisco bank or firm.

ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.

Awarded the First Premium at the Paris Exposition.

ADAPTED FOR

Smelting,
Foundry,
Mining
and
Steamships.

REQUIRES

Fifty Per Cent.

LESS POWER

Than any Blower

now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver mine; Gridley's Foundry, Gold Hill, Nevada; Aetna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

For Circulars and further information, address

THE PHILOSOPHY OF MARRIAGE, BEING FOUR important Lectures on FUNCTIONS and DISORDERS of the Nervous System and Reproductive Organs, to be held by addressing and including twenty-five cents, postage stamps, to Secretary PACIFIC MUSEUM OF ANATOMY, Montgomery street, San Francisco. 2v13-1y

"The Excellent"

Will not repair broken limbs nor leaky roofs; but it will quiet the nervous and brace up the weak. It will give more comfort to those suffering from dyspepsia or indigestion than any preparation you ever tasted or heard of. The first physicians use it, and it is made by

BARRY & PATTEN,

413 Montgomery street, San Francisco.

APPRECIATES IT.—One of the managing proprietors of a quartz mine in Yuba County, in directing us to send the **MINING AND SCIENTIFIC PRESS** to his Superintendent, adds: It will pay mining companies to require all their Superintendents to read your paper, to the end that they may be convinced that improvements can and must be made, in order to enable us to fully develop our great mineral resources."

AN IMPROVEMENT ALREADY.—Albert R. Davis has patented the employment of glycerine either with or without water, for saturating the wooden wall hangings which we have noticed as having been recently patented,—and thereby rendering them soft and plastic, and free from the danger of "checking" or splitting, either before or after they are placed upon the wall.

MORE OF HENDY'S CONCENTRATORS.—Four of these machines have just been shipped to the Joe Walker mine, near Havilah. The Superintendent of the mine, Mr. Belden, is the man who introduced these concentrators in Grass Valley, and is fully acquainted with their capabilities.

IMPROVEMENT IN MINE-CAGES.—A new cage has been patented by an Englishman, the peculiarity of which consists in the use of iron or steel tubing instead of flat bars. Both lightness and strength are secured by this means.

PLATINUM WARE.—The especial attention of dealers and others is called to the advertisement of H. M. Raynor, of New York, an extensive dealer in platinum ware, and purchaser of platinum scrap and ore.

DISEASES OF THE EYE.—During a late visit to San Francisco, we fell in with an old acquaintance from this county, Mr. G. W. Purdy, who formerly resided at Forrest City. About two years ago, while under treatment ourselves, we saw Mr. Purdy at the office of an oculist in that city, with eyes badly inflamed and the sight entirely lost. We saw him a few months later at another physician's, but his case was scarcely improved, and seemingly hopeless. His eyes have now entirely recovered, so that he goes about his ordinary business. From his own lips we learned that the restoration of his sight was entirely due to Dr. D. R. Morgan, whose office is at No. 627 Sacramento street, between Montgomery and Kearny, who cured him in the short space of eighteen weeks. Mr. Purdy mentioned several remarkable cures which occurred in the practice of Dr. Morgan during the time he was under treatment, among which was that of Mrs. Jane Albert, of Brownsville, Yuba County, and several others. Mrs. Albert had been afflicted with sore eyes from early childhood, and for eleven months previous to treatment she had not been able to discern light, nor had she seen the features of her youngest child, twelve months old. She had heard of the remarkable cure of Leonard P. Eder, of Marysville, and Joseph E. Haskell, of Sacramento, and determined to try Dr. Morgan. The result was that she was able, after ten days, to read ordinary newspaper print. Mr. Purdy was of course greatly rejoiced at the recovery of his sight, after so many trials and failures with different physicians.

The above is clipped from the *Mountain Messenger*, of February, 1863. 10v16 3m

MEDICAL AUTHORITIES have announced that not less than one-fifth of the entire population of the United States are afflicted with Neuralgia in some form. Surely the man who can safely remove such a vast aggregate of pain is a great public benefactor. Such is Dr. Turner, of Boston, in Massachusetts. His "Universal Neuralgia Pill" is pronounced on all hands, to be an entirely harmless and perfectly certain remedy for this most torturing of all known diseases. See advertisement in another column.

CO-OPERATIVE UNION STORE.—This is becoming one of the most useful institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions twenty per cent. cheaper than ever before, and the very best articles in market. The store is located at 115 Sutter street, Lick House Block. 22v15tf

Sheffield Scientific School Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1863, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING. 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, \$125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are various and expensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p

HANSBROW'S CHALLENGE Deep-Well, Mining and Double-Cylinder Patent Pumps.

Six-Inch Mining Pump.

These Pumps combine all the advantages of the common Lift and the Double-Acting Suction and Force Pumps, and are equally fitted for all—Household, Farm, Mill, Manufactory, Brewery, Ship, Railway, Mining, and other purposes, and are especially recommended on account of their lightness, compactness, durability, cheapness, and the facility with which they can be placed in any position.

They are adapted for Hand, Steam, Horse, Water, or Wind Power. They are more durable in all their parts than any other Pumps of the same power.

Four-Inch Deep-Well Pump.

The Valves are of the simplest construction, and can be readily taken out by loosening two common nuts. They are not liable to get out of order, and can at all times be removed without the aid of a skillful mechanic.

The lower valves of these Pumps work upon inclined seats, which prevents sand or other matter that the Pumps may take up, from remaining under the valves, or stopping the flow of water.

These Pumps are worked with less friction, and consequently require less power than any other Double-Acting Pumps of equal capacity.

All sizes, from 2-inch to 8-inch Cylinder, manufactured by the Pacific Iron Works, GODDARD LOCKE & MONTAGUE, 112 and 114 Battery Street, San Francisco.

Lind's Improved Turbine Water Wheel.

The object of this invention is to provide an improvement in turbine water wheels, to more perfectly utilize a very small stream of water, having a high head. This invention is an improvement on a former patent, obtained by the same inventor, and for which improvement an application for a patent is now pending through the agency connected with this office.

Fig. 1

The chief improvement in this invention consists in an ingenious method of so balancing the pressure of the water upon the wheel that the weight is almost entirely taken off the step, thereby avoiding a great difficulty heretofore encountered in turbine wheels, in the large amount of friction incurred and the consequent wearing of the step. This is accomplished by the construction of a flange, H, in Fig. 1, which is keyed to the driving-shaft, G, which revolves with the shaft in a water tight joint within the cover of the water chamber, F.

Fig. 2

In the wheel as heretofore made, the water is admitted at F, and passes down over the guide buckets, B, bearing down upon the step J, with a large portion of the weight due to the column of water employed in driving the wheel. Now by attaching the flange H to the driving-shaft, as above described, it is evident that the bearing upon the under side of this flange and upon the step J, can be made to perfectly balance each other, thus relieving the pressure upon the step, and consequently avoiding the friction due to such bearing and the consequent wear.

In order to more perfectly effect this arrangement, a chamber D, D, is formed over

the flange which takes up the small amount of leakage which must unavoidably find its way through the joint between the flange and water-chamber cover; a pipe with a stop-cock C, carries the water off and regulates the pressure so that the hub of the wheel may not be forced too strongly against the hub of the guide buckets.

Fig. 2 shows a top view of the guide buckets, a section of which is shown in Fig. 1. These guide-buckets are so arranged, by their peculiar form, as to cause the water to act in a more efficient manner than when passing through ordinary spiral or vertical buckets.

The passages I, I, Fig. 1, are made through the hub, to relieve the wheel from the pressure of the water which may accumulate above it.

A series of plates not shown in the illustrations, are introduced around the bottom of the wheel and corresponding to the curve of the buckets, by which the discharge opening may be more or less constructed to correspond to the varying amount of water which can be introduced upon the wheel.

We understand that the inventor is meeting with good success in introducing this improvement, and that it is giving the fullest satisfaction wherever it has been tried.

CHANGES IN THE GULF STREAM.—We had occasion a few weeks since, to notice an important change reported in the "set" of the Gulf Stream, between the island of Cuba and the peninsula of Florida, by which vessels passing through the Straits of Florida were drifted much nearer to the Florida Keys than formerly. This change was attributed to the elevation of the ocean bed in the channels between Hayti and Cuba, and between Hayti and Porto-Rico, during the late terrible earthquake at St. Thomas. It is now stated, on the authority of Capt. Sherburne, of the ship Gamecock, which recently arrived at New York, that the inner edge of the Gulf Stream, in latitude 36° 20', (about the latitude of Norfolk) is now at least 100 miles further east than formerly. Such a deviation in the course of this stream would indicate that it must strike the western coast of Europe at a much lower latitude than heretofore. The climatic effect of the impingement of the waters of this immense ocean river of warm water, upon the British Isles and the north-western coast of Europe is well known; and the consequence of such a change in its course may be readily imagined. If the observations of Capt. Sherburne should be confirmed by more minute surveys, the subject must afford a theme for a most interesting discussion among the learned. It has been stated that if the direction of this stream could be so changed as to cause its waters to strike the European coast at the Straits of Gibraltar, the British Islands and the lands bordering on the North German ocean would be too cold for anything like successful cultivation.

A DREDGER is employed deepening the moorings at the side of North Point dock. No vessels there at present.

Repeal of the Tax on Manufactures.

One of the most important acts of legislation accomplished in Congress during its present session, is the passage of the Bill removing the Federal tax of five per cent. from the great bulk of manufactured articles; and leaving subject to taxation only a few, such as tobacco, spirits, sugars, etc., which can well afford to sustain it. The new law goes into operation on the first of May, and its beneficial effects will soon begin to manifest themselves all over the country; but nowhere more sensibly than in California, where our incipient efforts at manufacturing industry have been well nigh taxed out of existence. It is well known to all who have made the matter a subject of special inquiry, that some of the manufacturing enterprises on this coast, have paid into the National treasury nearly every dollar which they have earned, over the cost of living, ever since this five per cent. tax has been in force. In many cases manufactured articles have been taxed and retaxed at almost every stage of their progress, and to such an extent as to utterly preclude all probability of realizing a profit from such manufactures, even while the public was most intolerably burdened by the increase of price which such a taxation rendered indispensable.

It is estimated that as many as 8,000 articles are exempted by the new law, the most important of which, as affecting this coast, are as follows:—Bullion, books, boilers, boots and shoes, bags, brass work, candles, chemicals, carriages, cloth, clothing, furniture, powder, glue, glass, hats and caps, iron products, lead, leather, lard and linseed oil, masts, spars, cordage, pickles, printed matter, paints, photographs, paper, pottery, quicksilver, turpentine, lime, water craft, wool, soap, salt, sails, steam engines, etc., etc.

The repeal of the tax on the various articles which enter into the business of ship-building, it is thought will do much towards reviving this important branch of our domestic industry. It is to be hoped that since Congress has seen the necessity of such an important reduction in the burden of national taxation, as bearing upon the middle classes, it will soon be found willing to go one step further, and exempt all incomes from taxation which do not exceed the sum of \$2,000. The derangements of business and depression of currency, consequent upon the war, has so increased the cost of living in this country, that but few persons with large families, and resident in cities or in populous neighborhoods, can sustain themselves in anything like a comfortable manner on \$2,000 a year in currency. To such the income tax is a burden too grievous to be borne, and the revenue now derived therefrom should be collected from the property of the country. But the corner has been fairly turned, and let us hope that the country is now about to enter upon a road which will lead to prosperity and repose.

CONTINENTAL Life Insurance Company, 302 Montgomery street, corner of Pine.

THE EUREKA PROCESS.—G. H. Gray & Co., of this city, have recently purchased the right to use the Eureka or Ryerson process, with the "ball grinders," in their mill at Gold Valley, Sierra county. This process, it will be recollected, is the one which has been for some time in use on the Fremont-Mariposa Estate, working rock from the celebrated Josephine mine, and reducing it to an impalpable powder by means of small, half-ounce iron balls, working in a revolving barrel; the amalgamation being effected by means of Ryerson's superheated steam apparatus. Both of these operations have already been fully described in the columns of the PRESS. The Messrs. Gray recently visited the mill in Mariposa, and spent a sufficient length of time in examining the practical working of the process to satisfy themselves that it is all that is claimed, in point of efficiency and economy. The total cost of working rock by this process, there—using a very inefficient stamp-mill for the preliminary crushing of the rock, and wood for steam at a cost of \$6 a cord—is said to be a fraction less than \$10 per ton. The Messrs. Gray hope to be able to put in machinery for working this process at a cost but little, if any, exceeding the ordinary stamp and pan process.

MILL-STONES FOR THE INTERIOR.—We learn from Mr. C. F. Travis, manufacturer of French Barr Mill-Stones, 109, Mission street, that an order has been received for four large mill-stones, one four feet in diameter, and three measuring four and one half feet, for the new Merchant mill, now being put up at Benicia, by A. L. Sherman & Co. The Tehama mill of four run of stones in Tehama County, lately burned down, and now being rebuilt, is also to be supplied from Mr. Travis' establishment in this city.

THE LABOR EXCHANGE.—This institution is now fairly under way. The office was opened on Monday last at 319 Battery street. An opportunity is here furnished for the coming together of employers and those seeking for employment. Let all who wish laborers of any kind avail themselves of the opportunity; and thereby relieve distress while putting money in their own purses.

Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

Formation, Distribution and Age of Igneous Rocks.

EDITORS MINING AND SCIENTIFIC PRESS. I see that "Criticus" retires from the field, because he has neither time nor disposition to devote to a discussion which he fears might be endless. He has made quite a number of assertions which he would have us believe; but no effort to substantiate even one of them. If that gentleman is actuated by proper motives, and an honest and laudable desire to contribute his mite to the advancing science of our day, he has not made it apparent. Notwithstanding he feels so well assured in asserting that my paper—"Formation, Distribution and Age of Igneous Rocks"—contains "errors strangely numerous, and of a character the veriest snatterer should be able to detect," I question his ability to point out one of them. So far as having studied the natural sciences to "so little purpose" in the past, is concerned, I acknowledge it, and at times feel painfully sensible of it.

As "Criticus" seems to be a follower of Dana, I shall proceed to partially review the theory of the sedimentary origin of metallic veins, and in doing so, shall make some brief quotations from writers who favor or are committed to said theory; nor do I expect it will be by any means an endless task to show it to be so inconsistent and completely at variance with facts, that no one will hereafter be found to do it honor. The following extracts will serve to show what are the opinions of representative men:

Prof. Blake, in a recent Paris letter, which appeared in the MINING AND SCIENTIFIC PRESS, says: "It is generally known, although it may not be a familiar fact to some of your readers, that at Lake Superior, large lumps of pure silver are found in the midst of masses of copper; the two metals being as perfectly united as if soldered; yet there is no mingling or alloy at the junction. It is now generally conceded, that these metals were deposited from solutions under the influence of electrical currents."

Prof. Silliman, in speaking of what he terms the "Mother vein" of Amador and Tuolumne counties, "thought the inference unavoidable, that the enclosing rocks in each case exercised an important influence on the mineral contents of the vein." I am also credibly informed that he stated in conversation within the past year, that it was his opinion that the nuggets of gold found in placers, were aggregations due to electro-chemical action.

Prof. Dana says, "The quartz veins could not have been filled from below, by injection—a view not now accepted for the generality of mineral veins. They must have been filled either laterally or from above. In all such conditions of continued heat beneath an ocean, the hot water would dissolve silica freely within the rocks, or from them (as happen in the Geysers in Iceland and elsewhere), so that the region would become one of hot silicious solutions, permeating and overlying the upheaving strata. This silica would be free to consolidate or metamorphose the strata, and to fill up all rents or openings, whether they are no thicker than a sheet of paper, or rods in width; the waters would work laterally into the fissures, as this would be the tendency of the internal flow or movement, and they would carry mineral materials of various kinds with them; besides the superficial waters might deposit what mineral matter they contained along with the silica; and at the same time vapors might arise from below along the line of rents, and be still a third source of metallic or mineral material. Between these methods appears

to lie the process by which the gold was introduced into the quartz veins, and it remains for further research to ascertain the particular facts in the case. It was a period for each gold region, of long continued beat (occupying probably a prolonged age), and also of vast uplifting and disturbance of the beds; for the beds are tilted at various angles, and the veins show where were the fractures of the layers, or the separations and gapings of the tortured strata."

To take a common sense view of the matter, it does seem extraordinary that fissures found in the bed of an ocean, subject to such long continued and violent agitation, instead of being filled with ooze or other sedimentary matter, which always exists in such localities, should be so exactly filled with metal-bearing quartz.

Such a theory of the origin of metallic veins, as my friend "Criticus" has it, is "elaborate," very. Whenever man has sprung too rapidly to a conclusion, he has alighted upon error, and has had to retrace his steps; and Prof. Dana would have done much better to have confined himself to the relation of simple and well ascertained truths, than to have made a work, otherwise meritorious, the vehicle of a theory based upon such questionable premises and involving such absurdities.

Now gold, although it is so widely distributed, and its ores are very numerous, has but one solvent in nature, viz., chlorine. I find it stated in that "small but reliable" text book designed for the use of common schools, "Comstock's Chemistry," that protosulphate of iron precipitates metallic gold from its solution, and potash and soda give a yellow precipitate of gold. Sulphate of iron is the product, to a greater or less extent, of the decomposition of all rocks and soils containing gold, and potash and soda form a large percentage of most rocks. Then the free electricity with which the earth is charged, is confined entirely to the surface, as is proven by the late attempt to establish telegraphic communication with the Pewabic mine, Lake Superior, when the circuit was broken at the short distance of thirty feet. A single wire was used, and although it worked well enough upon the surface, the operator tried numberless experiments, and it could not be made to "give one little sign of life." In ordinary telegraphy with a single wire, the circuit is effected by displacement, because the ocean of free electricity which bathes the earth's surface is so near an equilibrium as to present a medium for displacement. There being no medium for displacement between the surface and interior, there consequently can be no electrical currents. I am informed that when the circuit was completed with insulated wire, so as to present a medium that was independent of all outside electrical disturbance, the difficulty was overcome.

Now mark the conditions presented by this theory of the sedimentary deposition of quartz veins and their contents. It supposes that the tetrachloride of gold is a product of nature, to be held in solution in contact with the reagents that would vitiate the whole process,—such as sulphate of iron, potash or soda,—and through a lengthened period of time to be carried to open fissures by a filtering process, to be deposited in veins and aggregated in masses by electro-chemical action, where no currents of electricity exist! The reagents,—potash, soda, and sulphate of iron,—are so abundant and prevalent as to render the existence of the tetrachloride of gold, as a product of nature, highly improbable, if not impossible; under any circumstances.

Whatever may be the difference of opinion among the advocates of this peculiar theory (it is doubtful if any of them have any clear ideas upon the subject) as to the particular mode of aggregation of quartz veins and their contents, they all assume that the material of which they are composed originally existed in the enclosing or country rock,—which assumption amounts to a tacit admission of an eruptive era of the metals, as will appear from the following considerations: When the crust of the earth becomes sufficiently cooled for water to rest upon its surface, it must appear evident that the only source from which rock matter could have been derived, must have been from beneath the then existing crust. Some geologists estimate the stratified rocks, in some localities, to be as much as fifteen miles in thickness, the greater part of which must have been brought to the surface by volcanic action, either eruptive or intrusive, as no mineral can exist in the atmosphere in the gaseous form at so low a temperature as 212° Fah.

(To be continued.)

[Editorial Correspondence.]

The Sheffield Scientific School of Yale College.

During a brief stop at New Haven, (Ct.) we enjoyed much satisfaction in visiting this new and notable institution. By the kindness of Prof. Brush, we were shown through the mining and metallurgical museum, comprising a large and varied collection of veinstones, ores, valuable non-metallic minerals, building stones, fossil fuel, etc., numbering several thousand specimens, systematically arranged so as to afford the observer ready and practical information. Groups are shown, illustrating the dressing of ores, and various metallurgical processes throughout, with models and diagrams of mines and works. In addition to this, Prof. Brush has a private collection of over 5,000 specimens, which he has been more than twenty years in accumulating and arranging. This collection is designed for the special purpose of illustrating the characters of the various mineral species and varieties as fully as possible. Many of these specimens are very rare, and their beauty utterly indescribable. The use of this collection is likewise extended to students and friends, with a modest air of delightful generosity.

To Prof. Wm. H. Brewer (formerly of the California State Geological Survey) we are indebted for information concerning the School, its operation and success. We have only time to say, however, and that in a general way, that it is progressing most successfully and satisfactorily. Where we see so many combined advantages, so easily attainable as those offered in this School, it seems a wonder that more of our young men are not availing themselves of its privileges.

It is plain to us that our Government could not make a more profitable investment than by gratuitously assisting at least a thousand young men to attend such an institution. The time must certainly come when mining institutions will be liberally sustained by Congress.

The ability and unselfish devotion of the professors of this School (several of whom we know have refused better financial engagements,) entitles them to great rewards, which, we trust, will eventually accrue to them. The founder of the School, Mr. Joseph Sheffield, has donated in all over \$160,000 to this branch of Yale College. The elegant building itself was constructed under his supervision, and upon a portion of his own homestead, adjoining the College Square; and with modest but vigilant eye, he still watches over its interests and rejoices in its advancement.

Special students, "pursuing a higher or a partial course," are admitted. Connected with this class, we had the pleasure of meeting a most estimable friend,—Rev. John Dickinson, late of the "University of the Pacific," at Santa Clara. Mr. Dickinson is an eloquent speaker, and an enthusiastic student of geological and mineralogical science. He intends returning to California, where we are sure his services as a teacher will be the more highly appreciated for his attainments while absent.

The advantages derivable from this School, over all others in the United States, by its connection with Yale College, and the numerous and able Faculty of that Institution, its extensive Cabinet, Museum, Library, School of Fine Arts and Design, are clearly impressed upon the mind by a personal visit to it.

The officers of the School are as follows: President, Rev. T. D. Woolsey, D. D., LL. D. Professors:—W. A. Norton, M. A., Civil Engineering and Mathematics; James D. Dana, LL. D., Geology and Mineralogy; Benj. Silliman, M. D., General Chemistry; Rev. Chester H. Lyman, M. A., Industrial Mechanics and Physics; William D. Whitney, Ph. D., Modern Languages; George J. Brush, M. A., Mineralogy and Metal-

lurgy; Daniel C. Gilman, M. A., Physical Geography; Samuel W. Johnson, M. A., Analytical and Agricultural Chemistry; Wm. H. Brewer, M. A., Agriculture; Alfred P. Rockwell, M. A., Mining; Daniel C. Eaton, M. A., Botany; Ottniel C. Marsh, M. A., Paleontology; Addison E. Verrill, B. S., Zoölogy. Instructors:—Mark Bailey, M. A., Elocution; Louis Bail, Drawing and Designing; John Avery, M. A., Physics, etc.; James B. Stone, C. E., Mathematics; Beverly S. Burton, Ph. B., Chemistry; C. J. Sheffield, Assaying.

The President and the professors comprise the governing board of the Institution. One hundred and twenty-three students were in attendance in 1867. The object of the Sheffield Scientific School is to provide young men with instruction in the various departments of Mathematical, Physical and Natural Science. By an Act of the Legislature it has been constituted the Connecticut College for the promotion of Agriculture and the Mechanic Arts; and has therefore received the benefits of the Congressional land appropriation for that Commonwealth.

A. T. D.

A "PLANING SAW."—SOMETHING NEW.—Mr. C. N. Brown, inventor, recently showed us, in New York, his improved saw, which cuts and planes boards, and other lumber, at one operation. The saw used at the time was some fifteen inches in diameter. The teeth are all removable, without the use of rivets, are hardened to a chisel temper, and ground, when dull, instead of filed. They are without any "set," but one or more are constructed with planing or cutting edges on each side, which cuts what is usually taken out by the set of the saw. In the machine we noticed that but one planing tooth was used, and yet it made as good a surface, on each side of the lumber, as any we have seen from an ordinary planing machine. The cut was from a stick of green pine. It appears to be a great improvement in cutting up lumber for manufacturing purposes, as well as for sawing from the log; saving machinery, space and handling. Mr. Brown has a very ingenious tool for adjusting and holding the teeth of the saw and grinding them down to uniform size and shape by the use of emery wheels. When this improvement is further advanced our readers may expect more information concerning it.

A. T. D.

VEGETATION IN THE MOON.—Professor Schwabe has recently announced the discovery of what seem to be signs of vegetation in the moon. There are certain dark lines or scratches extending across the slopes of the highest lunar mountains, which have been variously accounted for. Prof. S. claims to have discovered in these lines a greenish color, which is only apparent at certain seasons. He therefore regards them as helts of vegetation.

HORSE-HAIR HATS.—The New York correspondent of the *Bulletin* says: A gentleman of this city has patented a process for making hats of horse-hair, and is now projecting machinery for manufacturing them on a large scale. He claims that he can make a gentleman's hat of the material named, that will not weigh one ounce. Ladies' hats—or whatever they may be called—will weigh a great deal less;—some of them, perhaps, almost nothing at all.

REMARKABLE MINING RELICS.—At different places in East Tennessee, where there are veins of copper, zinc, or lead ore, there are found excavations that must have been made hundreds of years before that section was settled by our people. So very extensive are some of the excavations that to make them now, with all modern facilities, would require an expenditure of thousands of dollars. The rocks seem to have been fractured by heating and throwing water upon them. Some persons suppose these excavations were made by Spaniards, who were in search of precious metals.

Mechanical.

ISHERWOOD DISPOSED OF.—The committee of practical engineers which has been experimenting at Buffalo on the economy of the use of steam expansively, made a report which effectually finishes up the Isherwood humbug. In eight years this officer has spent nearly a million of dollars of the public money in "experimental researches" to prove a stupid theory of his own, which has now been demonstrated to be a fallacy. The *Artisan* describes the experiments of the committee, with the conclusions arrived at; and thus closes its article:—"We should not omit to state that so striking is the economy attainable by using steam expansively, as above demonstrated, that no less than five of the largest propellers on Lake Erie are now having their engines removed in order that they may be replaced by highly expansive engines, the same as above described, and such as Mr. Isherwood says are "rubbish, fit only for the scrap-heap." This fact becomes all the more important (and it is a remarkable proof of the great economy that is attainable in practice by the use of steam expansively) when it is remembered that these changes are being made by men who spend their own money and who earn their living with their vessels;—quite a contrast to our beautifully-polished naval engineers, headed by their doughty chief, who, with both arms in the treasury up to his elbows, preaches doctrines that would consign a civilian engineer to everlasting coventry.

TITANIC STEEL IN ENGLAND.—It may be a matter of interest to some of our readers, and especially to those interested in the project of utilizing the titanic iron sands found along the beach west of this city, to learn that the Titanic Iron and Steel Company of London, projected under the auspices of Mr. Musket, and employing the iron sands of New Zealand, is still in operation, and turning out a very superior article of steel. The company appears to have much to contend with in the prestige and activity of its powerful rivals in Sheffield—the acknowledged seat of the steel trade of the world; still it has thus far held its own, and pays expenses, while the company's steel is growing in favor with all who continue to use it. Some of the largest engineering firms in the north of England, are using this steel, and pronounce it superior in quality, especially for wearing and cutting purposes.

AMERICAN MANUFACTURES IN ENGLAND. The *American Artisan* of March 25th, gives, under the above heading, a communication from a New Yorker, recently returned from England, who while in Birmingham, asked at a machinists' supply store, for "some of the most recently improved articles for use in a small machine-shop." He was informed that they had the very best of all such articles. After being shown a lathe-chuck, a collection of drills, etc.,—all of which were stamped with the American maker's name,—and all of which he declared himself already provided with,—a case of very fine steel standard rules, gages, try-squares, etc., was shown him; with the assurance that they were "the most perfect made, and guaranteed even for standard work." On examination, these too, showed the American stamp. He told the gentlemanly proprietor that he had a set of these also. He was now asked, "Where is your shop?" "In New York." "Then," said the man, "I have nothing new to show you."

IMPROVED BORING MACHINE.—The apparatus which forms the subject of the invention of Mr. H. de la Roche Tolay, of Paris, consists of a continuous rotary piercing-machine. The piercing-machine is composed of a metallic frame, on which is placed a Perret's water-pressure engine, which gives motion to the driving shaft, at one end of which the piercing-tool is placed, and at the other end the piston. The front part of the boring-tool is furnished with Leschot's annular cutter. The perforation is affected by the simple grinding away of the rock to be bored.—*London Mining Journal*, March 7th.

DUTY OF STEAM ENGINES.—Mr. Warington Smyth, in the course of a lecture recently delivered at the Royal School of Mines, made the following remarks as reported in the *Colliery Guardian*: The principal engines in use now-a-days, were those of Bolton and Watt, which had been greatly improved by the Cornish engineers, so that the amount of duty obtained was something quite wonderful. Watt thought he had achieved a great thing when a duty was reached of seventeen millions of lbs. raised one foot by the expenditure of a single bushel of coals; but the labors of Wolfe, Hornblower, and Trevethick, and others, had been so successful that the duty was raised to fifty or sixty millions, and in some extraordinary cases ninety millions of lbs. raised a foot high with one bushel of coals. This was a very important matter, both as to the saving effected in fuel and in the expenditure of working, as the greater the amount of fuel unnecessarily consumed the greater the wear and tear.

In this connection we may add, that the *London Mining Journal* reports the number of Cornish pumping engines running in January last, as 23. They consumed 1,665 tons of coal, and lifted 13.0 million tons of water 10 fms. high. The average duty of the whole is, therefore, 53,200,000 lbs., lifted one foot high, by the consumption of 112 lbs. of coal. In December, the average was 49,500,000 lbs.

LEATHER BELTS AND CAST IRON PULLEYS. The *Journal of the Franklin Institute* gives the particulars of a series of experiments undertaken at the instance of Mr. Robert Briggs. A perfectly new belt, an old one, and one partially used, and in good order, were the subjects of the experiments. The conclusion arrived at was that the adhesion of the old and the partially used belts was much increased in damp weather, and that they were then in their maximum state of efficiency; whereas the new belt seems to have been most efficient when the atmosphere was dry. As regards the tensile strength of belts, it was found that 200 pounds per inch of width is the greatest resistance to tearing that can be expected from ordinary belts.

NOTES FOR MACHINISTS.—E. P. W. sends the following to the *Scientific American*, as things to be remembered by machinists: Never turn a shaft without drilled centers. Never turn the body until the ends are squared to the center and to the length. Never allow a nut and bolt to pass that will not run down properly on each other. Never pass a nut that does not screw down fair on its seat. Never take the last cut on a thin casting, whether in the lathe or planer, without easing off the chuck or clamp that confines it. Never use a tool square across the face to rough-off with. Never attempt to work steel that is harsh from want of proper annealing; better carry it back to the smith and have it annealed properly, then waste time and tools in doing what will be only a poor job. If you can buy good tools cheaper than you can make them, buy them.

IMPROVEMENT IN HOT BLAST FURNACES. An improvement made by Col. Richard Long, of Chillicothe, Ohio, in hot air blasts for furnaces, consists in substituting fire-clay pipes for iron, and supporting the walls with fire brick and iron plates; thus overcoming contraction and expansion,—the pipes being made oval in form (the narrow edge uppermost), thus preventing the accumulation of dust and equalizing the heat. The joints are coupled with the same material, and made perfectly tight. The main points suggested by this invention, are the cheapness and durability of the material used, the ease with which it is renewed or removed, the perfectly tight joints, and the reduction in friction; thus increasing the power of the engine, and consequently the production of iron.—*Pottsville Standard*.

LOW WATER SAFETY-VALVES.—A new safety valve has been patented in England, so contrived that when the water falls below a certain height, a float upon its surface raises a valve and permits the water to escape directly into the fire, thereby extinguishing it.

Scientific Miscellany.

THE AMERICAN ELEPHANT.—The *American Naturalist* for March, has an article by Dr. Packard, on "the Hairy Mammoth," from which we quote the following:

"Prof. Leidy has claimed, on partial evidence (a complete skull not having yet been found), the existence of a truly American species of elephant (*Elephas Americana*), representing in the new world the European and arctic Hairy Mammoth. This species replaced, in the warmer parts of our country, the Siberian elephant. Its remains, like those of the mastodon, are found at the bottom of swamps and in the upper strata of river sands. It should be borne in mind by the reader, that these deposits of river alluvium are the most recent of the deposits of the post-tertiary age. They should not be confounded, as they often are, with the true glacial or drift deposits, which were thrown down at an immensely earlier period, so far as known facts teach us. In the Northern States, at least, we had the following succession of events antedating the appearance of the American elephants, including the mastodon, though this does not preclude their existence southwards, where the climate was hotter. The warm climate of the latest Tertiary (Pliocene), in which the temperature of New England and the Northern States may have been like that of the Gulf States at the present day, gave way to the arctic cold that brought with it the snows and glaciers of the true Glacial epoch, the period which separates the Tertiary from the Quaternary periods. For ages the ice king held sway over this immense territory. The walrus, and perhaps the musk-ox, the white bear and arctic fox occupied the land that had perhaps shook beneath the tread of the Megatherium and Botherium, the American lion and the mastodon and elephant; and the creeping willow and procumbent birch and lowly cranberry, the snow white *Arenaria greenlandica*, and other arctic plants succeeded the gaudy flowers and luxuriant forests of the latest Tertiary soil.

Centuries after, the continent slowly sinks, perhaps 600 feet; the sea laves the foot of the White Mountains; the temperature is raised and the glaciers have retreated to the Alpine valleys. This is the period of the *Leda clays*, in which bones of the hison and walrus are found. But not until a later and still warmer period, that of the rearrangement of these sands and clays into lake shores and fertile river intervals, does the mammoth (so far as fossil evidence goes) seem to have flourished abundantly."

FLUID IN CRYSTALS.—A paper was recently read before the Manchester (Eng.) Philosophical Society by Mr. J. B. Dancer, in which he states that he had examined a large number of crystals of various kinds, and had found fluid in quartz from several different localities, and also in fluor spar. The latter burst at a temperature of 180°. Sir David Brewster found pressure cavities containing fluid, in the diamond, ruby, emerald, amethyst, and other crystals. Mr. Dancer suggested the employment of the microscope as a means of detecting spurious from real gems; the flaws and cavities are so distinct in character in the two, that there is no difficulty in doing so, after a little experience.

IMPROVEMENT IN VOLTAIC PILES.—M. Zaliwski Mikorski's latest experiments show that by increasing the height of the elements without altering their base, a current proportionate to the height may be obtained. He recommends the following method for increasing the energy and permanency of a Bunsen's battery: Place two porous vessels one within the other; into the first, containing the carbon, pour nitric acid; into the second, sulphuric acid; finally, into the outer vessel, containing the zinc, pour sal-ammoniac. There is no effervescence, and the zinc undergoes no useless destruction.

THE EARTH'S TEMPERATURE.—At the depth of forty feet the temperature is about the same in one place as in another, and in all seasons of the year. In the colder latitudes, however, the earth at the same depth is always frozen, only on the surface. It is a startling fact, that although flowers bloom, and strawberries fruit, yet beneath them all the ground is eternally frozen. It has been proved that in Siberia the ground freezes to the depth of at least 800 feet.

COLORS OF STARS WITH DIFFERENT TELESCOPES.—Mr. John Browning of the Royal Astronomical Society, states that colors of celestial bodies estimated by comparison with the ingenious chromatic scale of Admiral Smyth, in which each color is represented of four different degrees of intensity, will not possess any relative value unless taken in connection with the aperture of the telescope employed when the color was estimated. Experimenting in relation to this subject, he had noticed that the chocolate color of the so-called belts of Jupiter is much more perceptible with an object glass of six inches in diameter than with one twelve inches. A small cluster in *Perseus* appears of an indigo-blue with 8½ inches, Prussian-blue with 10¼ inches, and royal-blue with 12¼ inches of aperture. Were due allowance made for this disturbing influence by variation of aperture, many discrepancies between colors attributed to double stars by different observers might probably be reconciled.

INFLUENCE OF THE DIFFERENT RAYS UPON VEGETATION.—Recent experiments by L. Caillette confirm those made many years ago by Morren, of France, with regard to the influence of the luminous rays in vegetable growth. The former advances a step further by including the red, as well as the yellow ray, among those most favorable in promoting the decomposition of carbonic acid gas by plants. All the rays more refrangible than the yellow are powerless in this respect. Under the influence of green light, not only does no decomposition take place, but new quantities of carbonic acid are formed; the exhalation of the gas by the fresh leaf being nearly as much under this condition as when placed in the dark. Light passed through a solution of iodine in bisulphide of carbon, prevents decomposition of the acid, and the appropriation of carbon by the plant, but does not seem to increase the quantity of acid, which might be inferred from the fact that the violet is the most refrangible of the colored rays. Many experiments have been made in this country which give the same general results as those of Morren and of Dr. Dauhney, of England, but differ somewhat from those of Caillette.

ALCOHOL FROM WOOD.—The wood is boiled for twelve hours in hydrochloric acid diluted with ten times its volume of water. The acid liquid, which is charged with grape sugar formed from the spongy cellulose, is then withdrawn, the excess of acid saturated with lime or chalk, and a small quantity of yeast is added, the temperature being kept at about 68° Fab. Fermentation soon ensues, and when bubbles of carbonic acid gas are no longer evolved, the liquid is distilled to obtain the alcohol.

PALEOZOIC INSECTS OF NOVA SCOTIA.—Mr. J. Barnes, of Halifax, last year found in a bed of shale at Cape Breton, a wing which must have belonged to an insect measuring at least seven inches across the wing. Dr. Dawson says: "We can imagine the larvae of these gigantic Ephemeræ swarming on the deep black mud of the ponds of carboniferous Acadia, and the perfect insects flitting in millions through the dense thickets of the coal swamps."

THE NEW PLANET.—The planet which has been named *Undina*, was discovered simultaneously by Mr. Peters, of Hamilton College, New York, and Tietjens, of Berlin, Prussia. It is between the 10th and 11th magnitude. It was first seen on the 7th of July last.

OXYCHLORIDE OF MAGNESIUM AS A CEMENT.—M. Sorel produced a cement by combining chloride of magnesium with oxide of magnesium, which readily takes all varieties of form, and when solidified, receives a high polish. It resists the action of water. It answers the same purpose as oxychloride of zinc and is cheaper.

THE ELECTRO-DEPOSITION OF COPPER.—It very frequently occurs that the copper which is deposited by electric means is so brittle as to render it unfit for manufacturing purposes. A very simple and ingenious method of preventing this has been described by M. Bouillat. He has found that a small quantity of gelatine dissolved in the water of the bath, gives a copper nearly equal in malleability to rolled copper.—*Pop. Science Review*.

Boiler-Making, etc. in this City.

There appears to be considerable activity at the present time among the boiler-makers in this city,—as any one may become most sensibly aware of by taking a walk through Fremont and Beale streets. We dropped in, a few days since, at the establishment of Baurhyte, McAfee & Spiers, on Howard, between Fremont and Beale streets, where we found a large amount of work in the shop, or just completed, as follows:

Three boilers for Scherman & Co., who are building a flour mill at Benicia. The engine and other machinery for this mill, is being built at the foundry of Keep, Blake & Co., Stockton. The mill will be supplied with five pairs of $4\frac{1}{2}$ feet stones, and will be ready for this year's crop. The second pair of boilers for the Rolling Mill Co., were finished and ready for testing. They had just finished a large fire-box, or locomotive boiler, for the C. S. Navigation Co., which appeared to be a fine piece of workmanship. Mr. McAfee has done himself much credit in the construction of this boiler; from an examination of the workmanship, and the substantial manner in which it is braced, we should suppose there could be very little danger of an explosion, under anything like fair usage.

There were two boilers, 44 inches in diameter by 10 feet in length, just being finished for Messrs. Ford & Sanborn, of Watsonville, designed to replace the old boilers now in their sawmill. We noticed, also, a fire-box boiler, for Mr. Wiley, designed for a boat which he is building, at Union City. This is a duplicate of one built for Barron Bros., which we have already noticed. Mr. W. is having the engines for his boat built at the San Francisco Foundry.

Messrs. B., McA. & S. have also a contract for a portable engine and boiler, and a set of double circular saw irons for the San Joaquin Mill Co., which is putting up a mill for cutting lumber, the logs for which have been floated down from the mountains during the past season. The machinery for this mill is being built at the Fulton Foundry, an establishment well known among saw millmen for their superior class of work in that line. The drawings for the engines,—which are 9-inch cylinders by 16-inch stroke,—were made by Mr. Spiers. In preparing them he has endeavored to combine the best features of the Scotch and American engines of that class.

We also noticed on the floor of this establishment the large cylinder, which we recently mentioned as having been ordered by the Wood Preserving Co. of this city.

They are also building two boilers 44 inches diameter by 24 feet in length, for Mr. Stanford, designed for a sawmill, the machinery for which we believe is being built at the Fulton Foundry; also one 48 inches diameter by 16 feet in length, for a new quartz mill now being erected in Scott's Valley, Siskiyou County. The engine and machinery for this mill is being built at the Aetna Foundry.

We noticed several small boilers in process of construction, designed to be used for working Wilcox's Water Lifters, which method of raising water is about to be more extensively introduced into use in some portions of this State, and of which we shall say more at a future time.

THE UNION FOUNDRY,

Booth & Co., recently shipped for Martinez an upright tubular boiler, for Coffin & Standish's new steam plow. This boiler has been built with especial reference to compactness and lightness, these being very essential requisites for the purpose for which the boiler is intended to be used. It has 120 $2\frac{1}{2}$ -inch tubes; is 48 inches outside diameter, and seven feet two inches long. This plow, with an engine and frame built expressly for the work, will soon be ready for trial.

This foundry has also recently turned out

four boilers, 54 inches diameter by 16 feet in length, two of which were for establishments in this city, and two for sawmills at Coburn's Station, just over the Summit, which are employed in getting out railroad ties for the Central Pacific R. R. Also two others, one of which is 48 inches diameter by 14 feet in length, and the other 52 inches by 16 feet—both designed for Kimball & Ogden's extensive carriage factory, now in process of erection at the corner of Fourth and Bryant streets in this city.

We also noticed at the same works six other boilers, whose destination we did not learn, but whose dimensions are as follows:—48 inches by 16 feet; 48 inches by 15 feet; 44 inches by 15 feet; 40 inches by 14 feet; 36 inches by 13 feet; and 36 inches by 12 feet.

MINERS' FOUNDRY.

At this foundry we gathered the following items in the way of boiler work, just completed or under way:—A large low-pressure 9-foot diameter fine boiler, for the new Oakland ferry boat, now being constructed at the Potrero; four fine boilers, 36 inches diameter by 16 feet long, for Mr. Pershbocker,—destined for a sawmill up the coast; two 35 inches by 26 feet each, having two 15-inch flues, designed for Page & Downer's sawmill, near Santa Cruz. They are also building an engine for the same parties.

At this establishment they are building one of their Hicks' engines, to be accompanied by a tubular boiler 36 inches diameter by 15 feet long, for Harris, Tate & Co's flour mill in Monterey County. Another of these engines, with 30-inch by 12-foot boiler, is being built to the order of Mr. F. S. Wilcox, for his tannery at San Antonio. A boiler and engine was shipped from this foundry, about two weeks since, to C. W. Howland, for his flour mill at Petaluma.

Among other work, we noticed two large boiler-iron tanks, in process of construction for the Linseed Oil Factory in this city. These tanks are 36 feet long by 12 feet wide and 6 deep—much the largest ever built on this coast. The necessity for such immense reservoirs, is pretty good evidence of the large amount of oil which is being manufactured at that establishment.

The large amount of boiler work which is now being turned out at the establishments noticed, may afford some index of the revival of business in the foundry and machinery line, after the stagnation necessarily incident to a long and unusually severe rainy season. It may be proper to state that the establishments noticed above do not include one-half of those which are more or less engaged in boiler-making in this city, to say nothing of the numerous establishments in other parts of this and the neighboring States. We shall take a look into other of our city shops at an early day. In the meantime we congratulate all parties on the favorable indications for an unusually prosperous season which is apparent in every department of industry throughout the State, and entire Pacific Slope.

TAXING MINING CLAIMS.—The following, from the Nevada Gazette of April 24th, is the reply of the District Attorney of Nevada county, to certain formal queries by E. F. Bean, County Assessor:—

1st. That mining claims, and all other possessory rights, interests or estates upon the public lands are legally assessable for State and county taxes, to the extent of their value.

2d. That such interests should be assessed as real property, and in the usual legal mode of assessing such property.

3d. As respects the certificates of stock in corporations organized in this State, in all cases when the property of such bodies is actually taxed, the certificates are by law exempted from taxation. The certificates of stock in corporations organized in other States, present more difficulties. Upon the whole I am of the opinion, that, under the authority of the case of the People vs. McCreery, it is your duty to assess all such stock at its actual valuation in this State.

WM. W. CROSS,

District Attorney, Nevada Co.

New Patents and Inventions.

Under this heading we shall mention, from week to week as occasion may demand New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

List of patents issued from the United States Patent Office for the Pacific coast and Territories for the week ending April 7th, 1868:

COMBINATION LOCK FOR DOOR.—Wm. C. Bussey, San Francisco, Cal.:

FRICTION CLUTCH.—James B. Johnson and William H. Birch, San Francisco, Cal.

POTATO DIGGER.—Benjamin P. Wright, San Francisco, Cal.

PROCESS OF EXTRACTING GOLD FROM ITS ORES.—Rudolph D'Heureuse, San Francisco, Cal.

GANG PLOW.—W. F. Higgins and Jerome Perry, Watsonville, Cal.

ORE CRUSHER AND GRINDER.—Seymore Hughes, San Francisco, Cal.

KILN FOR DRYING MALT.—Christian Offinger and Sebastian Grupp, San Francisco, Cal., assignors to themselves and Henry Stempleman of same place.

CULTIVATOR AND HARROW.—Simon Conrad, Petaluma, Cal.

PATENTS RECENTLY ISSUED.

75,851.—IMPROVED WASHING MACHINE.—John F. Chambers, San Francisco, Cal.

I claim the combination of the toothed beaters or rubbers E, E, with the yielding, corrugated metallic bottom, C, C, constructed and operating substantially as described.

The object of this invention is to provide an improved washing machine, so constructed that by means of wooden teeth, clothes, etc., may be rubbed upon a yielding corrugated metallic surface, in imitation of the rubbing upon a common wash-board, by hand. This is accomplished by employing a square or oblong box, having a concave corrugated bottom, with a center piece of wood or other material, made smooth. The beating or rubbing apparatus consists of three or more boards, set edgewise on the box. The lower edges of the boards are slightly rounded, with a plane in the center, and provided with teeth, which are made in opposite directions to the plane, similar to saw-teeth. These beaters are suspended by an axle, which passes through upright standards, and has its bearings on the sides of the box, and are operated by an eccentric driving-shaft, having its bearings in standards.

76,070.—BACK AND ABDOMINAL SUPPORTER. Mrs. John Ford, Salem, Oregon:

I claim the abdominal supporter constructed as described, consisting of the band B, provided with the shoulder straps F, and thigh straps G, and having a gathered center H, upon each side of which the eyeleted strips I, J, are secured, the ends of the said bands provided with the eyeleted strips L, and clasps C, D, all arranged as described, whereby the supporter can be converted into a band, to be used after confinement, as herein set forth.

76,116.—WINDOW FRAME.—Otto Edward Henry Sturcken, San Francisco, Cal.:

I claim 1. A swing side-strip B, combined with the adjustable cord-fastening D, and ground sash E, all constructed and operating as described.

The lock C, in combination with the sash E, strip B, fastening D, as described and for the purposes set forth.

72,249.—IMPROVED DEVICE FOR RAISING WINDOW SASH.—John D. Cramer, San Francisco, Cal.:

I claim the combination and arrangement of the several parts of my device, namely, the recess A, with the slotted plate B, and the plate D, connected to the staff C by the curved piece e, substantially as described.

The object of this invention is to provide an improved device for raising and lowering the upper sash to windows, more especially those windows composed of one light or pane of glass, known as plate glass. To do this the inventor cuts an opening or slot midway in the upper or transverse part of the sash, over which is placed a plate, having an opening large enough to admit the end of a rod or pole, curved at its upper end, and having a flat vertical plate attached to it. In order to open or close the window, the curved end of this pole or rod, of sufficient length, is inserted in the

slot, by a person standing on the floor, and the sash thus raised or lowered. By this means a ready article is at hand for opening and closing windows without recourse to stool, chair, etc., and liability to bodily injury by falling, breaking of glass, etc.

76,508.—IMPROVED KILN FOR DRYING MALT. Christian Offinger and Sebastian Grupp, of San Francisco, Cal., assignors to themselves and Henry Stempleman, of same place:

We claim the openings D, D, for the passage of cold air to the chambers C, in which the cold and hot air are combined, and the pipes E, E, E, provided with cups or valves E', for conveying it to different parts of the perforated plate, the whole constructed and arranged substantially as and for the purposes specified.

The design of this invention is to provide a kiln for drying malt, in which a great saving of time will be had, while economy and convenience will be one of its features. The invention consists of a furnace constructed in the usual manner, having an arch work of masonry or iron over it, which forms an air-chamber entirely around the furnace. The furnace is placed upon a bed having openings in its sides leading under the center of the furnace, for the purpose of supplying cold air to be heated for the purpose of drying. The arch-work has, radiating from its top and directly under a perforated metal plate, pipes or tubes, for the purpose of equally distributing the heated air from the furnace, in order that the malt placed upon the screen or perforated plate may be quickly and evenly dried.

RECENT INVENTIONS.

NEW HYDRAULIC NOZZLE.—The Nevada Transcript describes a new hydraulic nozzle recently invented by C. C. Craig and Joseph Craig, of Nevada, which consists of a globe or socket joint, having a canting fifteen inches in diameter. The inner hemisphere fits smoothly to the inner surface of the outer sphere—the former being supplied with the escape pipe and the latter with the supply pipe. The entrance is six inches in diameter and the escape five and a half. The pressure of water on the interior of the globe causes the surface to fit closely together and there is no leakage. The escape pipe may be turned easily either in a perpendicular or horizontal direction so as to throw water over an extent of forty-five degrees, and the range will be greatly increased by attaching a short hose to the nozzle. The object of the invention is to change the direction of a stream without trouble, and also to do this without diminishing the pressure of water.

MINERAL VS. AGRICULTURAL.—The following from the Marysville Appeal of April 26th, explains itself:

Department of the Interior, General Land Office, Washington, March 27th, 1868.—Register and Receiver, U. S. Land Office, Marysville, (Cal.), gentlemen:—Complaint has been made to this office that lands in townships 20 and 21 North, Range 4 East, Mount Diablo Meridian, Cal., within the 20 mile limits of the Oregon and California Railroad Co., have been fraudulently surveyed and returned as "agricultural," and are now being filed on as double minimum; while in fact they are mineral lands containing valuable deposits of gold. You are specially advised not to suffer entries to be consummated as "agricultural" entries, where there is a prima facie showing, or where there is good reason to believe that the predominating value of the land applied for, consists in its deposits of gold, silver, copper, quicksilver or coal, without a full investigation upon sufficient notice to parties adversely interested, and further instructions from this office, after an examination of the testimony thus taken, which you are directed to transmit with your joint opinion thereon.

You will be further advised in reference to this matter on the receipt here of fuller information, accompanied by affidavits of leading citizens of the neighborhood, which it is stated are being prepared for transmission.

In the mean time you are requested to report to this office all information at your command or in your possession, touching the matters above referred to. The Surveyor General has been written to upon the subject. Very Respectfully,

JOS. S. WILSON, Com'r.

The patent coupon-tickets and nippers went into use yesterday on the different street railroads. The process of taking fare by these is very slow, but may be more rapid when the conductors are familiar with them.

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board

SAN FRANCISCO, SATURDAY MORNING,
May 2, 1888.
Financial.

Our domestic money market demonstrates increased activity and life. Demands for money for business purposes are decidedly more urgent, giving good assurance of a renewed and increasing trade with encouraging prospects. First-class commercial paper is readily discounted at 1 per cent. per month, and second-class borrowers find accommodation at 1 1/4 per cent. The requirements of stock brokers have been considerably increased of late, and are supplied at 1 1/4 per cent—a somewhat wider range. Loans of large amounts upon real estate, and other unexceptionable collaterals, are effected at 10 per cent. per annum. The rates in savings banks rule mostly at 1 per cent. per month, at which figure the demand is fair, the balances of cash on hand being none too large to create uneasiness about investment, although the deposits increase steadily.

Reports from the interior indicate a growing prosperity in all the several interests of agriculture, trade and mining. In this city, building is going on to an extent far surpassing all former years. Edifices, which two years ago were considered excellent, and even fine, have been placed upon rollers and trotted out to the suburbs, to make room for others of larger size and more substantial structure. Even since the cessation of the rainy season some of our widest streets leading toward the Mission have been more or less blocked by houses on their travels to the outskirts. Iron fronts are taking the place of stone and bricks, and the buildings faced with that metal present an appearance of neatness, grace and solidity imparted by no other material. San Francisco is full of strangers—visitors from the East—who, taking advantage of the reasonable rates of fare on the steamship lines, have come here with an eye to future and permanent location. It is worthy of record, that the first day the California Labor Exchange opened for the discharge of its self-imposed duties, over one hundred and fifty applicants were supplied with employment. On the occasion of inaugurating this valuable aid to operatives, Mr. Curtis remarked that the Pacific Railroad was ready to employ five thousand hands, and that parties receiving a certificate from the Directors of the Labor Exchange, to the effect that they were bona fide applicants for obtaining work, would be passed over the road, free of charge, to the point of operations on the eastern side of the Sierra Nevada. He agreed to pay them thirty dollars a month in gold, food and lodging included, which, with economy and sobriety, would enable each man in seven months to purchase eighty acres of the most fertile lands along the line of road. The Central Pacific Railroad now employs sixteen hundred mechanics of different kinds, whose wages average from two to five dollars per day, in gold, according to the nature of their trades. Mr. Curtis added, that the road could employ about twelve hundred more this summer. These are very prominent and important facts, which we commend to the attention of all who are really desirous of employment. It cannot now be urged as an excuse, that the cost of transportation is too great to permit a poor man to reach the field of operations. There are scores of men in this city who are now loitering about the streets, professing to seek work; but in reality passing a life of idleness and want, which will eventually lead them to the commission of crime, if continued.

City Stocks.

In miscellaneous shares there is little doing, and the offerings have been comparatively small during the period under review. These securities are at present held with more firmness, and prices in consequence show considerable improvement. Small sales of Spring Valley Water were made at \$65 50, and California Steam Navigation Co. at 70 per cent. Central Railroad stock was in the market at \$51 00/50.

The San Francisco Gas Co. paid its usual monthly dividend of one-half per cent. on the first instant. The Pacific Bank, on the same date, disbursed one per cent. per month for the past four months. Spring Valley Water Co. will disburse a dividend of 1/2 per cent., on the 10th instant.

The receipts of the local insurance companies during the month of March, and previously this year, according to the returns made to the Internal Revenue Department, have been as follows:

	March.	Previously this year.	Total.
Pacific	\$66,999	\$128,862	\$195,861
Union	32,711	70,691	103,402
National	67,423	109,554	176,977
Fireman's Fund	23,157	34,957	58,114
Builders'	18,006	35,314	53,320
California	13,496	22,390	35,886
Merchants' Mutual Marine	24,889	27,291	52,180
Occidental	6,244	9,784	16,028
Home Mutual	9,924	15,558	25,482
San Francisco	5,419	8,114	13,533
Peoples'	4,478	12,593	17,071

Totals.....\$241,151 \$492,786 \$733,936

The returns were made upon a logical tender basis, the rate—72 cents for January, 71 cents for February and 72 cents for March—being fixed every month by the Assessor of the district.

The above statement shows a gain over the receipts in February of \$21,539. The receipts of the several companies in March, as compared with February, show the following difference:

	March.	Previously this year.	Total.
Pacific	\$24,449	\$43,644	\$68,093
Union	21,857	39,338	61,195
Central	12,989	24,169	37,158
Front Street, Mission & Ocean	7,996	14,327	22,323
Market Street	7,401	12,336	19,737
Potrero and Bay View	1,845	2,692	4,537

Totals.....\$76,727 \$136,507 \$213,234

As compared with the total receipts in February we find a gain of \$7,689. The receipts of March as against February show the following difference:

	Increase.	Decrease.
Omni-bus	\$1,384	
North Beach and Mission	1,904	
Central	1,929	
Front Street, Mission & Ocean	755	
Market Street	1,654	
Potrero and Bay View	71	

Mining Share Market.

The mining share market during the past week retained the activity noted for some months past, but prices exhibited a downward tendency up to near the close, when a better feeling manifested itself and a slight rally took place. We may reasonably look for a continued improvement, since most stocks had fallen to a comparatively low figure. In regard to developments through the Imperial-Empire shaft, it is our firm belief that the ledge will be reached before long, and the indications undoubtedly are favorable to this view. When this does occur, we may look for a sharp advance—possibly greater than the prospective prices recently obtained. This will cause renewed energy in others, and a more general activity will speedily follow.

The offices of the various mining companies are gradually locating in the neighborhood of the Board rooms, making it more convenient for all dealers. The Hale & Norcross company will soon remove its office to Hayward's new building on California street, and the Crown Point, Kentucky and Amador companies have already comfortable quarters in the same commodious, elegant and substantial structure.

Hale & Norcross—sold at \$2,050/2,000. The 1,080 foot station has been opened, and drifting will soon be commenced. The capital stock of this company has been increased to \$1,600,000, divided into 8,000 shares of \$200 each. This will make twenty shares to the foot. We have nothing of special interest from the mine. The office of this company will be removed to Hayward's new building on California street early next week.

Crown Point—opened at \$2,305, advanced to \$2,350 seller 30, declined to \$2,200, and closed at \$2,260. On the 28th of April, the 800 level east was not looking so well, but in the afternoon ore was making to the east again, with every appearance of widening. A dispatch of May 1st, states that the 800 level, in going south, showed great improvement—porphyry on the west side giving way to good pay quartz. Extract about 150 tons of ore per day. The receipts of bullion to date for April foot up \$98,123. The ore will average \$38/40 per ton during the month of April.

Savage—was quite active at a decline, receding from \$159 to \$152, and closing at \$155. During the week ending April 25th, 1,483 tons of ore were extracted, showing an approximate value of \$33 81 per ton. From the north mine, on the third station, a large amount of good ore continues to be extracted; but the south mine, on the fourth level, as they approach the Hale & Norcross line, is growing poorer. The winze to the fifth station from this point is 111 feet in depth, and said to continue in good ore. The connection will soon be made with the fifth station. The north mine on the fifth station looks very encouraging, and the south drift has improved considerably, while a west cross-cut, run to connect with the winze from above, is said to show six feet of good ore.

Imperial—exhibited marked activity during the period under review, dropping from \$290 to \$225, and closing at \$245. The water is decreasing quite rapidly, having been lowered twenty feet in the Alta shaft on the 30th ult., and in the twenty-four hours ending yesterday morning, one foot in the drifts. The previous day it was five feet in depth.

Empire—sold at \$302 60/250, and at the close \$285 is bid. By telegraphic advices of yesterday morning, we learn that the drifts contained five feet of water, but during the previous twenty-four hours had been reduced some eighteen inches. Gould & Curry was in the market at \$575/535, closing at \$550. We observe that A. K. Dwyer has assumed the duties of Secretary, while Mr. Bowie, the former Secretary, will soon leave to take charge at the mine.

Kentucky—declined from \$485 to \$430, and closed at \$445. Bullion receipts for April amount foot up \$74,765. Ophir receded from \$210 to \$170, closing at \$182. The new shaft is about 215 feet in depth, and sinking is easier. OVERMAN gradually fell from \$165 to \$109, rallied to \$122 50, and closed at \$136. Extract about twenty-five tons of ore daily from the 500 level, which, it is said, should yield \$35 per ton, and about eighty tons of various grades from other levels. Bullion receipts since our last issue, \$8,041.

Chollar-Potrero—opened at \$270, receded to \$225, and closed at \$242. No important change in the mine. The upper portion of the Blue Wing stop shows a slight improvement. On the 27th of April, they shipped 84 tons of ore to the mills. SEGREGATED BELCHER sold at \$21 50/15, and closed at \$18. It will require about two weeks to fully repair the shaft. Some 225 tons of "better" class, and 160 tons of low-grade ore have been extracted.

Lady Bryan—sold at \$38/26, closing at \$29. We are informed that no compromise has been made or entertained. Neither has any patent been issued by the United States, nor will be, until the suits now pending in Virginia have been decided.

The sales in the Board during the past week have been as follows: Regular sessions, \$2,053,019; open sessions, \$6,104—total, \$8,157,038. For the month of April, the sales aggregate \$12,385,314 against \$11,471,830 in March, being the largest amount of transactions in a single month since the organization of the Board.

NEW INCORPORATIONS.—Articles of incorporation have been recently filed in the County Clerk's office in this city as follows:

ALLEGHANY CONSOLIDATED MINING CO.—Yuba county. April 27th. Capital stock, \$600,000; 6,000 shares, \$100 each. Trustees: E. F. Baldwin, J. M. Buffington and Chas. Brainard.

RISDON IRON AND LOCOMOTIVE WORKS CO.—April 30th. Capital stock, \$1,000,000; 10,000 shares, \$100 each. Trustees: J. N. Risdon, C. E. McLane, Lloyd Tevis, C. J. Brenham, Joseph Moore, S. F. Butterworth and James Pollock.

MINING SHAREHOLDERS' DIRECTORY.

San Francisco Prices of Copper Ores.

SAN FRANCISCO, May 1, 1888.

We give the following as an approximate price at which copper ores can now be sold in this city. There is no sale for ores which assay less than 12 per cent. The late reduction in price is on account of the advance of freight:

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

Alpine County.

Miner, April 18th: We bear very encouraging reports from parties who are at work in the Morning Star mine. One who formerly worked in the upper level, tells us that they are now taking out a better quality of ore than ever before.

Like the Schenectady Co., owning the Tarsbush mine, the owners of the Leviathan stock are in a scramble for the control, and the working of the mine will be delayed to June 1st, or later.

Amador County.

Dispatch, April 25th: We learn that the Butte Basin Mining Co. struck a fine layer of gold bearing cement gravel, last Saturday night, which yields from 25 to 30 cts. to the pan.

In the Coney & Bigelow mine, they are now running levels north and south; the former about 12, and the latter about 10 ft. These levels are over 240 ft. below the surface, and in each level a vein of rock eight ft. wide is exposed.

Ledger, same date: The Coney & Bigelow mill is now in full operation, with an abundance of rock to keep it running night and day. The sulphurets from the Oneida mine, worked in the chlorination furnace of Coney & Bigelow, yielded \$115 per ton.

Placer mining about Volcano, is unusually prosperous. We are informed that claims on the old Hartum Ranch are paying as high as \$100 per day.

Calaveras County.

Chronicle, April 25th: Mr. Said is making rapid progress in the development of the "Petticoat," at Railroad Flat. He is taking very rich rock from the new shaft, and is preparing to sink the one from which the former owners obtained the \$202 to the ton ore, to a depth of 100 ft., when he will run a "level" between the two, a distance of 200 ft.

It is reported that \$10 was taken from less than one pound of rock from the Mexican claim, back of French Hill, of which we spoke last week. Pennell & Co. are at work on a ledge which runs parallel with the Mexican; is much larger, and prospects equally as well.

The Water Co. are making rapid progress with their ditch, and will probably have it completed by the 1st of June. The aqueduct, which is about 30 ft. high and 700 or 800 ft. in length, designed to carry the water across the sag to Buena Vista Hill, is about ready for use.

El Dorado County.

Placerville Democrat: The Gopher quartz mine in Kelsey district, is one of the best in the county. Last week, 40 tons of the rock were crushed which yielded \$30 per ton. A portion of the rock was not of average richness. The company propose running a tunnel, which will tap the lead at 250 ft. below the surface. Most of the stock in this lead is owned by residents of Coloma. The company is now in good circumstances, and intend thoroughly developing the mine.

Los Angeles County.

News, April 21st: We were shown some specimens of gold bearing quartz from Soledad, which will compare favorably with the best in the State. The free gold can be seen in all directions. The veins are large, the wall rock well defined and compact, and the ore easily crushed. Edgerton & Scott are crushing ore by water power, with a 2-stamp mill and a number of arrastras, with gratifying results. Searles & Yates have taken up a water privilege for a quartz mill, and surveyed a ditch that will give them a fall of 60 ft. They have three veins, all showing free gold and fine sulphurets. Mr. Polk, who bought the McMurty claim, is now working it with success. Discoveries of new veins are being made daily. There is plenty of wood for timbering the mines and for mill purposes, an inexhaustible supply of water, a good road from the mines to Los Angeles, 55 miles, plenty of game and the finest climate in the world.

Mariposa County.

Mail, April 24th: Letter from Hite's Cove says: There are now about 25 men at work getting timbers and digging the foundation for the new mill, which will be 20 stamps. Hite's Cove will then be thoroughly resuscitated, with twice her former importance, as regards mills, money and men.

Nevada County.

Transcript, April 23d: At Little York, Curran & Pattison are washing off the gravel above the blue cement channel in the old Remington claims, and after the first

run of a little less than 10 days, they cleaned up \$1,300.

The engine and hoisting works of the Cunningham mine are now being removed to the Buckeye.

The Sailor Flat and Last Chance Cos. at Gopher Point, are drifting into the banks and taking out first rate gravel.

The new mill of the Nebraska Co. at French Corral, has 10 stamps, and will be used for crushing cement.

Same of 24th: A company of Frenchmen is building sulphuret works at Canada Hill, for reducing sulphurets by superheated steam.

The Pittsburg mill is running 12 hours a day, and in a short time it will be running constantly.

On the Coe mine work has been resumed. We learn that they have found the ledge and are getting out excellent ore. The mine is owned by Davis, Coe, Roberts and others.

The rock from the Rising Star, upon which the Cornish mill has been at work for some time, is all crushed and the gold cleaned up. One hundred and seventy-two tons were crushed, yielding in the aggregate \$11,610, or \$67.50 per ton. This claim is owned by A. H. Hagadorn, Hugh McCauley, Jno. Keenan and Jack and James Pierd. They are now down upon the ledge 126 ft., and have any amount of first rate rock in sight. The rock just worked was taken out in sinking.

Mining at Badger Hill promises well for the season. Parties owning the ground adjoining the English Co's, have refused \$13,000 for their claim.

Same of 25th: Shaw & Co., Glenbrook Park, on the 1st of last month cleaned up \$2,500, and a short time since found a nugget weighing 14 ozs.

Considerable mining is being done in the vicinity of Rough and Ready. In a few days work will be resumed upon the Osceola.

The claims in Deer Creek have been delayed by the late spring. Leeth & Co., and the Irish Co. are engaged in washing the tailings from last year.

Euright & Barnett have been working their claims at Canada Hill for some time past. They are now running out the cut preparatory to cleaning up. McElvy is working below them with excellent prospects.

The Banner Co. are about adding 10 more stamps. This will give them a 30-stamp mill.

The owners of the Norridgewock have recently visited this city, and have determined to resume work.

All over Bridgeport, Washington and Little York townships new companies are opening on new gravel deposits, or for the purpose of striking old ones in new places. This revival in hydraulic mining is going on throughout the entire county.

Same of 26th: Calkins & Co., on Myer's Ravine, have been washing all the winter and in a few days will commence to bottom up.

The Murchis Bros. are washing in their gravel claims. Besides having excellent prospects in gravel, they have taken out a large quantity of float rock, which is exceedingly rich.

It is proposed to commence at the South Yuba and open a bedrock tunnel in the direction of Grizzly Hill. On this line paying ground can be reached in half a mile, and worked to the bedrock. When this tunnel reaches Columbia Hill it is thought that it will be of sufficient depth to give an outlet for the claims in the Basin, through which they may be worked to the bedrock. Large mining owners at Columbia Hill contemplate the work of this kind, and when it is accomplished the gold yield will be immense.

Same of 28th: A number of experiments were tried yesterday in Marselus & Maltman's diggings with the Giant powder. An old miner, used to blasting with common powder, who had charge of the work, says the execution in two hours was equal to three days' labor with ordinary powder.

Gazette, April 25th: At Chalk Mountain, preparations are being made for a big season. The Blue Gravel Co. will build two cement mills in May.

Same of 27th: Cbas. McElvy & Co., on Little Deer Creek, have struck a very rich streak of pay dirt in some new ground.

A gentleman from Omega informs us that the hydraulic claims at that place are in full blast. Every man in the place is hard at work and there is employment for 50 more at \$3 per day. Teeple & Creamer employ 10 men. Cannou & Co. are taking out about \$10 per day to the man. They work eight hands. Blankin & Co. are taking out \$30 to the man; six men at work. Cole & Co., with four men are taking out about \$50 a day. Charley Bowman is drift-

ing. He will set in a blast of about 80 kegs of powder in two weeks. Holland & Co. are taking out \$6 per day to the man. The Prescott claims started up last week.

The facts in regard to the Grizzly Hill claims, as stated to us, are that Weight & McDonald have purchased and paid \$16,000. They are working these claims with eight men and 300 inches of water. Weight cleaned up \$8,000 for two weeks' run of his old claim. John B. Hunter, of North San Juan, has purchased the claim of Martin Yongh on Badger Hill, for \$20,000, and will commence working it immediately. Pickett & Co. cleaned up \$2,600 for 10 days' run.

Grass Valley *National*, April 23d: We were shown some rock taken out yesterday from the Empire Co's ledge, on Ophir Hill, which was literally bespangled with gold. The ledge has been found about 18 in. thick. The rock was from one of the drifts on the seventh level. The company are now running for the eighth level—having sunk some 20 ft. on the ledge. After a nine day's run 2,850 ozs. of amalgam has been taken out, which will retort about \$6 per ounce, giving the sum of over \$15,000.

We understand that rock from the Idaho mine is now being crushed at the Sebastopol mill, Boston Ravine. It is said that the rock will probably yield from \$50 to \$75 per ton.

Same of 27th: The North Star mill started up again this morning, with all its batteries. The water has been in the mine several weeks, because of a breakage in the pumping apparatus.

The Black lead, just south of the Rocky Bar, has been leased by a company of practical miners, who will go at once to work in taking out quartz.

Grass Valley *Union*, April 24th: The old Gold Hill, was yesterday thundering away with her 20 stamps. Ophir Hill rock was being put through, is to be followed by a crushing from a ledge near the Eureka, and after that a run from Massachusetts Hill will come in.

EXCELSIOR.—*Transcript*, April 23d: The workmen on the Grant mine are pushing forward the new tunnel at the rate of 2½ ft. per week, and are running three shifts in 24 hours. The rock is very hard. The face of the tunnel is now rich in sulphurets, indicating that they are very near the ledge.

Same of 24th: It will be some time yet before much can be done at Meadow Lake in the way of mining. The snow in that vicinity was from 12 to 15 ft. deep on last Sunday. The mines are generally shut down, awaiting the return of good weather.

Placer County.

Dutch Flat *Enquirer*, April 25th: On Saturday last a cave occurred in the claim of Messrs. Taylor, Moore & Co., which caused a complete suspension of operations by that company, as also by Carr & Co. The portion of the claim caved was that upon which the ladder rested that carried the pipes of the claims mentioned into the diggings. The damage sustained by these claims will amount to some one or two thousand dollars, besides the loss of much valuable time in the midst of the favorable season of the year.

Mr. Osmyn Harkness, after a run of sixteen days in his claim near this place, cleaned up the sum of \$4,478. This is about an average of the yield of this claim. The expense of working the claim for the time stated, amounted to a fraction over \$2,000, leaving a net profit of \$2,300.

It is with feelings of more than usual gratification, that we are enabled to announce that the Blue Lead has been struck in this vicinity. This has been, it appears, a well established fact for several months, but the parties who were knowing to the discovery, for reasons of their own, thought best not to make it public until the present time. It appears from what we can learn, that Mr. Taef sunk two shafts in his diggings on the north side of the town last year, in one of which he found a strata of blue cement some 25 ft. in depth, which prospected from 12 to 25 cents to the pan. This was all our town needed to give it an impetus. We have these facts from Mr. Taef himself, and three or four other persons who have visited the shaft and seen the gold, men whose veracity cannot be doubted. The time is not far distant when mills will be in operation all over our hills, and the music of the stamps he heard far and near.

Auburn Stars and Stripes, April 23d: We learn that work upon the Rising Sun quartz claim, near Colfax, is being prosecuted with much vigor, and that at the depth of 118 ft., rock has been taken out that pays from \$100 to \$150 per ton.

Plumas County.

Correspondence of the *Plumas National*, April 25th: That there is a body of silver ore in sight, in the Enterprise mine, is past

peradventure. All the machinery for erecting a mill is on the ground, and there is every indication that in a few months the actual value of the ore will be determined. On the opposite side of the valley, all the mills with one exception, are pounding away in a lively manner. Judkins & Kellogg's mine never looked better, while the Caledonia is, apparently, "sterling." The Indian Valley ledge is supplying rock for both mills. In its most eastern drift, paying rock has been struck.

Siskiyou County.

Yreka Union, April 18th: The miners on Indian Creek are at work, and the yield of some of the claims is worthy of the early days. Messrs. Miller & Baker, for thirteen days' run of their hydraulic, cleaned up \$1,000. Mr. Rushmore, for 11 days' run, cleaned up \$1,800.

Cottonwood is likely to be more lively the present season than it has been for several years. The success of Shaft, Smith & Co. in working the Klamath River last year, has given a new impulse to river mining. Instead of a single claim, this year, there will be eight or ten worked.

Tuolumne County.

Sonora Democrat, April 25th: The Enterprise Ditch, which runs along the banks of the Tuolumne River to Don Pedro's, has recently been purchased by Messrs. Chas. & George Anderson. They have a good bank claim at Indian Bar and are preparing to work it by hydraulic power.

The Ruffle-tail mine at Whitman's Pass, has been purchased by Jas. W. Tulloch. The mill is now running, and a full force of men working on the mine. The rock, as far as the vein is developed, will pay \$100 per ton.

At Moccasin Creek, there are still a few good claims owned by white men, but Chinamen constitute more than half of the population, and are working the flats and bars where 75 cents per day can be made. There is nothing doing at present in any of the quartz claims on the "Mother Vein" which runs along the east side of Moccasin Creek. The "Wheeler-Hill" mine has had just work enough done upon it to keep it from being "jumped." We presume such also is the case with the Rising Sun, King Phillip, and all the others. Those mines are unfortunately owned by parties who have not a sufficient amount of capital to develop them.

Yuba County.

Marysville Appeal, April 25th: The Rattlesnake Co. at Brown's Valley, have ordered 50 pounds of Giant Powder, and do not hesitate to pronounce it a complete success in tunnel blasting. Mine owners from various parts of the State are visiting the mills to witness the *modus operandi* of the new explosive agent, Giant Powder.

Watson, of the Brush Creek mine (Sierra County) has ordered manufactured at the Marysville Foundry, a 60-horse power engine and other mining machinery for a 10-stamp mill.

ARIZONA.

Miner, April 11th: The Sterling mill, at last accounts, was not running.

The Aztlán mill, which has been removed to the Chase lode, will probably commence operations by the 1st of May.

W. Smith has gone to San Francisco to procure five more stamps for the Wickenburg mill, in which he is interested. Both mills are running constantly, and doing as well as usual.

COLORADO.

Register, April 9th: Mr. Reichenecker has commenced fitting up the Montana mill in this city, and will have it ready to run in about a week on custom ore.

Wm. Allen is cleaning out the Rosecrans lode on the Casto Hill. The shaft is 50 ft. deep. This mine paid well from the surface. The ores run as high as \$450 per ton, in stamp mills.

Wm. Stocks is working the Channey lode in Lake Gulch. He is down about 10 ft., but is taking out very rich quartz and dirt. He is carrying it on his back about a mile, and manages to pan out \$3.50 a day. He had some of the quartz run in a mill, which yielded \$350 in gold.

We were shown to-day, 1½ ozs. of very coarse gold taken from a claim on Chicago Creek by one man in five days. He had to dig his dirt from a drift, pack it in sacks 40 rods, and wash it in a rocker. The dirt was taken out of the bedrock, on a claim that was worked to the bedrock in '61.

Messrs. Hamau & Miller, on the Kirk lode, Quartz Hill, just below the Alps, are now down 60 ft. and have got everything arranged. They have from 18 to 20 in. of excellent copper pyrites.

We understand that the Fairmount Co. started up a portion of the machinery in their mill in Hukill Gulch, last week. Their mill building is three stories high, with a stone basement. It is designed for 20 ar-

tras, only two of which have been started. The ore is ground in a Chilean mill, in the third story, from which it is conducted to the arrastra.

Last week, Bonzie & Co. on Chicago Creek, Idaho district, cleaned up eight ozs. from 2½ days' work by five men. H. Scovel & Co. 1½ ozs., from four days' work by two men. Mead & Blanchard, from four days' work, 3½ ozs. Hunter & Medley on South Clear Creek, on Saturday, sliced two hours and got seven pwts. Glenfield, Wright & English, and Jos. LeGould, below them, have dirt from 8 to 38 cts. per pan. Gus. Reeder & Co. on Bull Bar, from four to ten pwts. per day to the man. P. Mickel working alone, just below them, on Saturday last got 15 pwts. Deau & Co. on Elk Horn Bar, average five pwts. per day to the man.

Denver News, April 8th: Mr. D. C. Travis showed us yesterday a piece of quartz from the Rising Sun lode, Granite district, Lake county. The free gold was to be seen all over it. The specimen was taken from the shaft at a depth of 30 ft., at which depth there is a vein of ore 30 in. wide.

We understand that the celebrated Five-Twenty lode, of California Gulch, has been sold for \$40,000, providing the capitalists find it as rich as represented.

Boulder News: The Ni-Wot Mill, in Ward district, has started up again. A copper lode has been discovered on Four-Mile Creek, above Maxwell's mill. Haswell and Henry are about to start their mill in Ward district, on ore from the Aetna lode.

Tribune: E. W. Colih, of Jim Creek, has shown us two bars of silver bullion, weighing 108 ozs., that had been extracted from 2,500 lbs. of unassorted ore from the United States Bank lode in Boulder county. This lode is a branch or spur of the Roh Roy and Hoosier lodes.

DACOTAH.

Cheyenne Record, April 4th: Letter from Dale City: The excitement is raging high, and miners are continually flocking in. Many tunnel sites have been claimed, and a number of men are already at work. Some of the ore assays very high. Every one here looks at the place in the light of a great mining town and I do not think they will be disappointed.

There are extensive gulch diggings in Four Mile Creek, Boulder county, which pay from \$3 to \$6 to the man. A large number of Coloradans are fitting out themselves with mining implements preparatory to their departure for that place.

Reports from the Sweetwater mines are encouraging. New leads are found daily. News concerning the late rush from Sweetwater to the mines in the Wind River mountains is anxiously awaited. The locality is 80 miles from South Pass City. The excitement was caused by one of Wash-akee's band of Snakes, who are wintering in the valley having exhibited gold which he declared he had washed there.

Sweetwater Mines, April 13th: An extensive tunnel claim has been located in Hermit Creek to run northwesterly with the hope of cutting the Careso ledge. It is owned by Messrs. Van Dyke, Cliff, Temple, Whitman, Worley and Martin, who commenced work on it April 7th, intending to drive it forward with all possible speed.

The Salt Lake Telegraph has a letter from South Pass City, from which we quote: Money is scarce here at present, there being few surface diggings, and what there are do not pay. You know quartz does not, until mills come into the country; money will therefore be scarce for some length of time to come. A great many of the lodes you hear so much about, when you come to look for them cannot be found. The country is full of stakes; a little quartz a stake, and a big name make a mining claim a big thing by the time it gets to Salt Lake City.

The Silver Bend Reporter gives the following extract from another South Pass letter, dated March 31st: I arrived here on the 26th inst., after being on the road from Salt Lake City 19 days. The roads were horrible—two to five ft. of snow all the way from Echo Cañon. From all I have seen of the country I think it is the highest hill out. I hope my opinion of the country will not prove true, but there were 75 of us who came here together and they are all of the same opinion as myself.

IDAHO.

Owyhee Avalanche, April 18th: We understand that Grayson, Beachey & Co. have engaged the Sinker mill to work Golden Chariot rock, and will start it as soon as the road is in proper condition for hauling thither. The greater portion of the way is now bare ground and dry.

Placer mining has commenced in the creeks and gulches. As the sleighing is done, quartz hauling has nearly ceased for the time, but will soon be resumed on wagons. The late unfortunate mining war,

we are happy to say, is at an end, and both companies are taking out large quantities of ore richer than ever.

In Flint district, the Rising Star Co. are energetically pushing forward work on their mine, which we are told is 6½ ft. wide and yielding very rich silver ore.

NEVADA.

Humboldt.

Register, April 25th: Robert McBeth and party pulled up stakes and struck out for Battle Mountain district in the early part of the week, fully prepared to test on a large scale the ores of that district. Arrangements have been made at the Goleonda mill to work a large quantity of the rock, and ox teams were taken up by them to haul enough to the mills to give the mines a thorough and satisfactory test. The district is within a few miles of the surveyed line of the Central Pacific Railroad.

Work has been resumed on the DeSoto mine, under the supervision of Mr. James Hendra. There is enough ore exposed in the mine to justify its owners in erecting reduction works. When the company does so, it will be able to make clear money, but so long as it costs \$70 per ton for milling—to say nothing about the stealings—it need not expect to make much headway. We can see no good reason why a splendid success should not be made in this mine if its owners will go to work systematically.

A Unionville letter to the Gold Hill News of April 27th, has the following: "None of our people have any idea of going north or to Sweetwater. Just wait until the railroad comes and we'll show you, not one mine or one lode, but hundreds of them pouring a steady stream of silver, gold, copper, lead, antimony and sulphur through that great national artery. Our people are determined to stick to Humboldt. Not a day passes but I hear men asking each other, will there be a market for ores at the dump or on the railroad, when it shall come? What are ores containing 20 per cent. of copper and \$50 per ton in silver worth? We know nothing about these things, but this we do know, that if persons who understand buying ores will give our miners any assurance that a fair price will be paid for all the ores that they will dig, a million of tons will be brought to the surface within the next 18 months."

Reese River.

Reveille, April 20th: Reveille district, about 150 miles southeast from Austin, will in all probability become the scene of considerable activity in the course of the present year. Negotiations are on foot between some of the oldest locators in the district and a New York company, which may result in the transfer of a large amount of valuable ground. If the sale should take place it is the intention of the company to erect an efficient mill in the district next fall. The district has produced large amounts of ore from the surface of a quality rarely equaled, and an efficient and well managed mill would make it a valuable bullion-producing region. Heretofore nearly all of the ore produced in that district was hauled to the mills for reduction, and we have yet to hear of the first instance where the ore did not pay all the expenses of mining, transportation and milling, and leave a substantial remainder for the miner.

Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

Virginia Enterprise, April 22d: The Sierra Nevada Co. have commenced work upon their main shaft with the intention of sinking it 200 ft. deeper, when a drift will be run to the eastward to the ledge, probably 400 ft. The last drift cut the lead 300 ft. from the shaft. Where it was cut the vein contained a considerable amount of metal, but it was much diffused; at the depth at which the new drift will strike the vein it is thought the metal will be sufficiently concentrated to pay for milling.

Same, April 23d: The new Ophir shaft is now down over 200 ft. Thus far it has not been necessary to blast, the rock being of a nature to be worked by means of picks, gads and sledges. No drift will be driven from the shaft before a depth of 800 ft. shall have been attained. The pump works to perfection and easily drains the shaft. Three shifts of four men each are being worked in the bottom of the shaft, and about 2½ cords of wood are consumed per 24 hours in running the engines.

The United States Co. is now sinking a large shaft in a line between the works of the Ophir and Sierra Nevada companies. Their shaft is now down some 33 ft. and will contain three compartments 4½ by 5 ft. in the clear. The rock at present is not sufficiently solid for blasting, and is taken out with picks and gads. The company expect to strike their lead at a depth of 500

ft. below the surface. A donkey engine for hoisting and pumping will be set up at the shaft as soon as it becomes too deep to be worked to advantage by means of a windlass.

April 26th: The Imperial-Empire M. Co. intend to ventilate the drift from the bottom of their new shaft by means of air forced down through a two-inch iron pipe with an apparatus attached to the engine on the surface.

Thirty tons of ore from the Columbia mine, situated in Spring Valley, below Silver City, worked a few days since, yielded the handsome return of \$1,045.37. Gold predominates in the ore.

The following is a statement of the amount of bullion shipped or received for assay during the past week: From the office of Wells, Fargo & Co., in this city, there were shipped 3,976 pounds of assayed bullion, valued at \$75,176.03; from the office of Wells, Fargo & Co., Gold Hill, 5,107 pounds, valued at \$126,500.11.

Trespass, April 25th: In the Sierra Nevada, the work of sinking the shaft 200 feet deeper was commenced on Monday last, with a good supply of wood and timber on hand. The work has progressed rapidly during the week, the rock being soft, and the workmen being able to sink about three feet per day. In the United States the shaft being sunk to strike the east ledge is progressing favorably. In the Ophir the rock in the shaft is still very hard. In the Gould & Curry the new pump is actively at work, but there is still a considerable quantity of water in the mine. In the Savage, the fifth station north, shows some improvement—otherwise there are no changes to note. The Hale & Norcross shaft is still being sunk, but no changes worth noting have taken place. In Chollar-Potosi, station timbers have been put in position in the 1,000-foot level, but drifting has not yet been commenced. In Bullion, the drift is now thought to be within four ft. of the ledge. Alpha is not being worked. In Eschewer, no work is being done in the mine. The drift west from the new Imperial-Empire shaft had reached a distance of 189 ft. this morning. The end of the drift was in soft clay, with indications of water, and the announcement that the ledge has been struck is momentarily expected. In Yellow Jacket, the work of sinking is still being prosecuted, with about 100 ft. more to go before drifting. The drift south is looking well. In Kentuck, the shaft is now down 40 ft. below the old sump, and is being pushed at the rate of about three ft. per day, the rock being quite soft. The mine is looking first rate. Shipment of bullion for April up to the 20th, \$46,546.27. Crown Point mine is looking well, with 10 ft. of fair ore in the 800-foot level. The receipts up to the 19th amounted to \$54,000 for the present month. In Belcher, drifting is still being prosecuted. In Segregated Belcher, the mine is now about clear of water, and men are engaged in timbering the 500-foot level. Overman, no change to note. About 100 tons of ore is being crushed daily, but the yield is not yet ascertained. In Lady Bryan, about 60 tons of ore per day is being crushed, but the yield is not so good as was expected.

Gold Hill News, April 21st: The Rogers mine, Flowery district, after a repose of two or three years, is about to be active again through the application of new hoisting and pumping machinery, and a change in the administration of affairs. There is said to be a large amount of valuable ore in this mine, but some of it contains a large amount of galena and other base metals. It is proposed to send a quantity of the richest to San Francisco to be subjected to the smelting process.

NEW MEXICO.

Santa Fe Gazette, March 28th: Mr. Bulard, a California miner, returned by last night's coach from Socorro. He had been to the Magdalena Mountains, in that county, examining the John D. Perry and Magdalena lodes of the Rio Grande Mining Co. He is especially impressed with the John D. Perry.

Letter from Pinos Altos to the New Mexican of March 31st: The excitement is beginning to get up to a fever point in this place. The Pacific lode is improving in its yield of gold. The quartz which is now being crushed at the mill of the Pinos Altos Mining Co. is said to pay over \$100 per ton. The Arizona lode is being worked by many new companies, since the quartz has been found to yield over \$100 per ton. The lead is in Gold Mountain, a few hundred ft. east of the Pacific lode. The Langston lode has also proved good. That is also situated in Gold Mountain, about one mile southwest of Pinos Altos.

Messrs. Anderson, Gilbert, Tompkins, and David Winterburn have prospected ex-

tensively in and around Pinos Altos during the past 15 months, and have located 10 gold and silver bearing lodes. The same party have discovered four gold bearing quartz leads in said Gold Mountain which are being worked.

OREGON.

Sentinel, April 18th: Col. Drew started the machinery of the Occidental quartz mill on Sunday last.

The miners at Sterling will commence cleaning up in a couple of weeks. They have the most flattering indications of a big clean up. In the Saltmarsh claim, two nuggets were picked up last week, one of which weighed a little over \$45—the other nearly \$40. We learn that the Ives lead is now paying handsomely. It was purchased about a year since by a party from San Francisco, who, from some cause, became discouraged. It is being worked with an arrastra, and its owner appears well satisfied.

Valuable Books on Mining, Mineralogy, Geology, Metallurgy, Etc.

- ANSTED'S Gold Seekers Manual. 1 vol. 12mo. cloth. \$
- ANTISELL.—The Manufacture of Photogenic or Hydro-Carbon Oils, from Coal and other Bituminous Substances, capable of supplying Burning Fluids. By Thomas Antisell, M. D. 1 vol. 8vo. 3 00

Mr. A. B. Butler is a duly authorized traveling agent for this paper. July 15, 1887.

San Francisco:

Saturday Morning, May 2, 1888.

Notices to Correspondents.

CENSUS.—It was a great error on the part of a morning cotemporary to state to its readers that China was only three times larger than California; in place of which, though confining the area within the limits most assuredly governed by the reigning dynasty, and excluding the vast territories of Mongolia and Manchuria, the area of China proper, is, nearly, if not quite, ten times more extensive than California, viz., 1,640,000 square miles, with an estimated population, according to the most reliable account, of 210,000,000 inhabitants,—or an average of 125 to each square mile, or a trifle less than the population of Massachusetts to its area. Because the rich alluvial lands of the seaboard is densely peopled and enabled to support this great population, it by no means follows that the more mountainous portions of the empire, the cradle of its great rivers, are by any means over-peopled. Belgium possesses a population of 350, and England of 250 persons to the square mile. The least populous county of the latter country, Westmoreland, has only a population of 75 to the square mile, although partly a manufacturing county; Falstaff's men in Kendal Green (the county town) must be in the remembrance of many of our readers. Westmoreland is a cold, mountainous region. Herefordshire, however, is even a less manufacturing county than Westmoreland, but possesses an exceedingly rich soil,—more so than any equal area in England or Wales, yet the population falls short of 140 to the square mile.

MOLASSES.—Cane sugar at the ordinary temperature but more rapidly at a boiling heat, reduces the protoxide of copper when in the presence of an alkali, either not at all or only very slowly, while if grape sugar is present, a precipitate of sub (red) oxide of copper is thrown down, after a few hours in the cold, and almost immediately on boiling. The red oxide of copper thrown down in the first recited case, is no doubt occasioned by the conversion of a part of the cane into grape sugar or glucose.

TEMBLADO, Los Angeles.—Fournet published an able treatise on the magnetism of rocks and minerals. According to Durochez, granite is rarely magnetic, but out of thirty-eight specimens of diorite, trap, basalt, trachyte and lava, thirty-four affected the needle, a result appearing to be due to small amounts of iron oxide of the titanite or magnetic variety.

BLOW-HARD, Sonora.—Owing to the loss sustained by the absorption of silver by bone-ash cupels, when cupelling by means of the blow-pipe, Mr. W. Mather in Siliman's journal [2] III 409, recommends the employment of finely powdered mica, which Mr. M. states he has found from experience to absorb much less silver than bone-ash.

B. S.—A fragment of carbonized wood was found in the rock-salt of Wieliczka which exhibited the structure of wood, though presenting a lignitic appearance generally. The subject occasioned much discussion in Vienna, in the course of which discussion many ideas respecting its probable origin were, we conceive, rather far-fetched; among which, we consider, was that which referred the carbonization of the wood to heat alone.

If one is not entirely blind, he will see at a glance that the best thing to improve his eye-sight, is to purchase his spectacles of C. Muller's No. 205 Montgomery street.

The Wheel Question—Finale.

The *Scientific American* quits the field in what it would fain make its followers believe is a blaze of glory,—but is in fact a retreat, under cover of the increased obscurity in which the subject is for the moment involved by the smoke of its parting shot. Suddenly changing front, it takes up a form of the question which it plainly never contemplated at the start, viz., that in which the two wheels are not in the same plane, but in planes respectively at right angles to each other. This form has been repeatedly referred to by its correspondents, but by the same dismissed at once as one which, although perhaps admissible under a strict construction of the question, was one not under discussion. Not only has this fact been always passed by without remark by that journal, but it moreover explicitly committed itself to the discussion of the case in which the wheels were in the same plane, when it said, in the beginning, that "L. M." by his diagram, proves himself wrong." "L. M.'s" diagram, it will be remembered, represented the wheels in the same plane. The *Scientific American* therefore long ago virtually closed against itself the very loop-hole of escape, of which it now feebly attempts to make use.

The two cases are, in one sense, different from each other. This may be shown as follows: 1st—The center of a rolling wheel of given size, (we address ourselves to such readers,—and such only,—as can understand the difference between the words *rolling* and *revolving*.) describes a line in space; which line is longer or shorter, according to the distance which the wheel rolls. 2d—The greater the distance the wheel rolls, the greater the number of revolutions which it makes upon its own axis. 3d—Consequently, the longer the line described in space by the center of a rolling wheel of given size, the greater the number of revolutions upon its own axis which that wheel makes. Now the line described in space by the center of a wheel rolling around a fixed wheel of the same size, is a circle, which is twice as large in the case where the two wheels are in the same plane, as in the case where they are in planes at right angles to each other; it therefore follows, that in the first case the wheel makes twice as many revolutions upon its own axis as in the last. The two cases are therefore,—as we have said,—unlike each other; and so far as regards what we will call the *horizontal* axis, but one revolution is made by the moving wheel in rolling once around a fixed wheel of the same size, *which is in a plane at right angles to its own*. But, as we before remarked, it has been distinctly understood throughout, by all parties,—including the *Scientific American* itself,—that this is not the case which has been under discussion.

We might go farther, and show that even in this case, it might be said that the moving wheel makes two axial revolutions; inasmuch as it really revolves once upon what we will call its *horizontal* axis—or the axis perpendicular to its plane,—and once upon what we will call its *vertical* axis—an axis coincident with its plane;—presenting as it does, in its course, both of its surfaces to an observer outside of the circle which is its orbit, or—which is the same thing—presenting always the same surface to an observer at the center of that orbit. In fact, the only difference between this case and the one in which the wheels are in the same plane, is, that one of the two revolutions on the horizontal axis, which take place in the last named case, is, in the first, *transferred*,—so to speak,—to the vertical axis. This fact is pointed out by the *Scientific American* itself, while presenting its level-wheel drawing in its issue of March 21, when, with charming simplicity, it tells us that for each revolution of the movable wheel about the fixed one, a cord will be wound once on the upright axle, and another

wound once on the horizontal axle; evidently quite unconscious that the fact is a damaging one to its own case,—for the two motions must necessarily both belong to the moving wheel, since, by the terms of the question, every part of the other wheel is *fixed*. The two winds of the cord which are in one case both on the same axle,—if there is one,—are in the other divided between the two axles; a change made necessary simply by the change in the form of the model. In fact, in every case supposable under the terms of the question, the moving wheel makes two axial revolutions; one on an axis perpendicular to its plane—that is, its "own" axis,—and one on its vertical axis. But this vertical axis changes as the angle between the two wheels varies. When the wheel is in the same horizontal plane with the fixed wheel, its vertical axis coincides with its "own" axis,—is in fact identical with it; so that, in that case, the wheel actually makes both revolutions upon its "own" axis. If the outer edge of the wheel be raised in any degree, its "own" axis forms an angle with its vertical axis,—which of course always remains upright; this angle gradually increases as the edge is gradually raised, until, when the wheel reaches an upright position, it becomes a right angle. The vertical axis then coincides with the plane of the wheel; and the two axial revolutions are distinctly separated,—and may be easily demonstrated by a simple mechanical arrangement, somewhat similar to the level-wheels of the *Scientific American*.

We might therefore, we say, assert with truth, that even in the case supposed by the journal aforesaid, the wheel makes two axial revolutions. But we refrain from doing so; because, in the first place, it is not the case which has been under discussion; and in the second place, it might possibly be thought a quibble,—almost as objectionable as the "artful dodge" executed by the *Scientific American*, in suddenly assuming it to be the case. The grand trouble with that journal was, in the beginning,—as we have once said was the case with its followers,—an inability to understand the difference between axis and axle; owing, of course, simply to its want of familiarity with the language in general use among geometers. But for this it would of course not have placed itself in such a disagreeable position.

In the case of the india rubber marker, and the other similar devices which the aforesaid journal has brought forward in illustration and support of its position, the fallacy is too plain to be discussed. In all these, the handle carrying the axis must be carried around with the wheel; which is equivalent to a second revolution in space, of that wheel upon its axis.

We are quite willing that the *Scientific American* should have all the benefit of the elegant and dignified style in which it takes leave of the subject; and the "tremendous applause from the gallery" which will probably greet the singularly appropriate picture of the broken wheel-barrow and its unhappy occupant. The good taste of the thing will no doubt be highly appreciated by nearly every member of the little group of grinning "one-ists," whose portraits are therein given. We do not suppose, of course, that the said group constitutes the *Scientific American's* entire force of retainers; it is quite probable that there are "a few more of the same sort."

Asking pardon of our readers for insulting their intelligence by again taking up the matter, we close with an extract from the last number of the *American Artisan*,—in the substance of which we concur: "As it is now settled in the minds of the great majority of all intelligent persons who have considered the question, that those correspondents who are sneeringly alluded to by our 'only reliable' cotemporary as 'two revolution philosophers' are right, and as more space has been already devoted to the subject than its importance demands, we shall now dismiss it."

The Mechanics' Institute Fair.

At a special meeting of the Mechanics' Institute, held at their rooms on Post street, on Thursday evening last, the Board of Directors were duly authorized to proceed to raise and expend the necessary funds for the erection upon Union Square, of a suitable building for the proposed Fair in August next. The funds for this purpose will be raised by private subscription among the citizens of San Francisco, to be repaid out of the first net receipts from the Fair. After the adjournment of the general meeting, the Board of Directors assembled at their room and adopted a plan for the Fair Building, which had been prepared by Mr. William Patton, architect. This plan was one of nine which had been submitted for competition, and calls for a structure in the form of a parallelogram, fronting 180 feet, by 350 in length. Additions will be made for engine and boiler room, and for kitchen and offices. The eaves of the main building will be 28 feet high, with a nave in the center 40 feet high to eaves, and 85 feet wide by 285 long, around the inside of which will be a gallery from which the entire promenade below can be witnessed. In the center of the nave will be an open space 65 by 50 feet, which will contain a fountain. In the north-east corner of the main building there will be a Social Hall, 60 by 35 feet. The entire roof will be shingled, and made perfectly secure against rain. The building will be well lighted from above. The highest portion will be only 87 feet from the ground, thus greatly reducing danger to contiguous buildings in case of fire. The building will cover some 12,000 square feet more than was occupied by the previous one on the same place, and will probably be built and made ready for receiving goods for a trifle less cost.

We understand that over \$14,000 have already been subscribed,—fully one-half of the entire amount needed. The proposed exhibition promises to be far the most valuable and attractive of any yet undertaken on the Pacific Coast,—and will doubtless result in a large decrease of the present heavy debt of the Institute.

A NEW FEATURE IN THE INSTITUTE.

We would take occasion in this connection, to mention that the Directors of the Institute propose to hold semi-monthly meetings in the lecture room of the building, for the purpose of having matters relating to the arts and sciences, inventions, public works and the various industries, etc., read before the Association, in the form of papers; somewhat after the plan adopted by the Polytechnic Society of the American Institute. It is proposed to have all such papers open to discussion and criticism, and to facilitate practical inventors and others to place before the Institute their claims to merit.

Any gentleman, member or otherwise, will have the privilege of addressing the Association on suitable subjects. The President, or some member of the Board of Directors, will be at the rooms of the Institute every Wednesday evening, where they will be pleased to meet any gentlemen who may have papers which they would like to read, or inventions which they may desire to place before the Institute.

NEW ASSAY FIRM.—By reference to their card, in another column, it will be seen that Messrs. Kustel & Hofmann have succeeded Mr. Molitor, as metallurgists and assayers at No. 611 Commercial street. Mr. Kustel, is well and widely known throughout the Pacific coast, through his published works on "Nevada and California Processes of Silver and Gold Extraction," and the "Concentration and Chlorination of Gold and Silver Ores." The new firm is prepared to attend to all orders in mineral assaying and analysis. Gold and silver ore worked in small lots up to 100 pounds, by chlorination and other processes.

Type Metal.

The Montezuma Smelting Works of Humboldt county, Nevada, are shipping to this city large quantities of metal peculiarly adapted for the manufacture of printing type. It is a new product for this coast; and illustrates the progress in developing the vast resources of the country, that is steadily going on in all branches of industry.

This metal is an incidental product, obtained in the separation of the silver contained in the ore from the lead and antimony with which it is combined. Its freedom from other metals generally found in these ores, renders it at once perfectly adapted to the type-founders' use. Messrs. Faulkner & Son, of this city, are now using large quantities of it in the manufacture of type,—and henceforward will rely upon their works for their entire supply.

The metal now being shipped is composed of lead thirty, and antimony seventy parts; but it is quite as convenient to produce these metals in any other proportions; and the alloy will require only the proper admixture of other metals entering into the composition of type, to be ready for use.

The type manufactured from this metal is much harder than that imported, and quite as tough; and will produce a clear and distinct impression on New York made type, without being in the least defaced. This fact indicates its great superiority,—and although it is apparently not so highly finished as imported type, the impression made by it is clear and handsome, and the type of much greater durability.

The price at which this metal is laid down here will effectually shut out Eastern and foreign importations to this market; and not only that, but most likely give us the entire supply of the Atlantic market. A shipment of some twenty tons is already on the way to New York, for the type foundries in that city.

Our iron foundries and machine shops are also using it for babbit metal; as it fully supplies the place of that important composition in relieving the friction of machinery. It is shipped in pigs of about seventy pounds, and each bears the stamp of the works—"Montezuma." J. Bluxome, Esq., metal broker, corner Washington and Battery streets, is agent for its sale. Within the next three months the Central Pacific Railroad will be completed to Orona, and within a mile and a half of these works; thus opening a cheap and speedy transportation for all the products of this celebrated mine.

CERIUM.—This metal has lately been separated by Wöhler, from the double chloride of cerium and potassium by means of sodium. Formerly it was prepared by subjecting pure protochloride of cerium to the action either of potassium or sodium. Cerium is found in comparatively rare minerals, and generally associated with the metals lanthanum and didymium. Cerium tarnishes in air at ordinary temperatures, and displaces hydrogen in boiling water. The pure metal is therefore valueless, except as a reagent. It forms numerous oxides and salts, none of which have, as yet, been used in the arts. Cerium has a darker blue than lead, and is only about one-half as heavy.

ALUMINUM FOR ROOFING.—A writer in the London Mining Journal suggests the use of iron plates coated with aluminum as a substitute for roofing slates. He says they could be made of any size, and would not cost five dollars per ton more than the uncoated plates; and moreover, since they could be bent to fit, and need not be laid double, like slates, five hundred such plates would cover as much surface as one thousand slates. Again, the latter would cost fifty dollars, and weigh three and a half tons; while the former would weigh about as many cwt., and cost, say, sixteen dollars.

PAINÉ & STEPHENS' IMPROVED CONCENTRATOR,

For Saving Gold and Silver Sulphurets.

This invention, a perspective view of which is given above, consists in applying machinery to the ordinary buddle, and rendering the same automatic in action. It is calculated to do a large amount of work.

One Machine, costing about \$1,400, is sufficient to work the Sands from 25 to 30 Stamps. But very little power is required.

It can be easily run by one man turning a crank. The principle on which it works is entirely dissimilar from any other machine now used on the Pacific Coast; although it is in almost universal use in Europe; but not so arranged there as to be automatic in action.

The illustration given herewith, was fully described in the Mining and Scientific Press of March 21, 1868.

One of these machines may be seen in constant operation at the Eureka (Watt's) mine in Grass Valley, where it is giving the fullest satisfaction, and is working all the tailings from thirty stamps. Another machine may be seen at the Banner mill, in Nevada, and a third below the Gould & Curry Company's mill, near Virginia City.

For further information, apply to THOMAS N. PAINE, Grass Valley, California.

PAINÉ & STEPHENS.

IRA P. HANKIN. A. P. BRAYTON. A. G. AUSTIN.

Pacific Iron Works.

First and Fremont Streets,
SAN FRANCISCO.

Having been established since 1851, we have accumulated a very large variety of Gear and other Patterns, which, with our superior tools and appliances, give us facilities for doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

Including High and Low Mortars, for wet or dry crushing; Furnace Irons for Roasting Ores; Fredberg Barrels; Vanner's and Wheeler's Amalgamating Pans and Settlers; Stamp Shoes and Dies of best White Iron; Russia Iron Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety; Pumping and Hoisting Machinery; Hunsbrow's Patent Challenge Pump, for Domestic, Ship and Mining use—the most approved and successful Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Variable Cut-off Engines," of which we are the sole manufacturers on the Pacific Coast, under license from the Woodruff & Beach Co., Hartford, Ct. As a simple, effective, fuel saving, first-class Engine, this is, without doubt, the best Engine made in the United States. Prices as low as possible for first class work, and we intend to do no other.

San Francisco, May 1, 1868. **GODDARD & CO.** 18v16of

Subscribers who do not receive the Mining and Scientific Press in due time, are requested to inform the publishers.

Eley's Ammunition.

These Cartridges are made in three sizes, viz., .577 (for Snider Enfield) bore; .540 (or half-inch) bore; and .451 (or small) bore.

These Cartridges have been adopted, after careful comparative trials, against all other descriptions, by HER MAJESTY'S WAR DEPARTMENT, as the standard Rifle Ammunition for the BRITISH ARMY, and are now used exclusively for the Snider Rifle, but are adapted to all other systems of military BREACH LOADING RIFLES. They are the cheapest Cartridges known, carrying their own ignition, being made wholly of metal, are water-proof and imperishable in any climate.

Boxer Cartridge Cases (empty), of all 3 sizes, packed with or without bullets, and machine for fastening same in Cartridges.

Makers of BOXER CARTRIDGES. 450 bore for Revolving Pistols, in use in Her Majesty's Navy.

PIN CARTRIDGES for Lefaucheur Revolvers of 12 m, 9 m, and 7 m.

CENTRAL FIRE and PIN FIRE CARTRIDGES, for all sizes of Guns, Rifles and Revolvers.

Double Water-Proof and E. B. Caps. Wire Cartridges for killing game at long distances. Felt Waddings to improve the shooting of guns; and every description of Sporting and Military Ammunition.

Wholesale only. **ELEY BROTHERS,** 18v16cwoy Cray's Inn Road, London, W. C.

Warranted for Three Years.

The Huntington Patent Elastic Springs

THE UNDERSIGNED BEG LEAVE TO CALL THE ATTENTION of the public to a new and superior article of BEDS, LOUNGES, etc., manufactured by them, at 353 and 355 Tehama street, between Fourth and Fifth, San Francisco.

The Upholstering is done upon Huntington's Patent Elastic Spring, the superiority of which over all others will readily be seen on inspection.

If you want a comfortable and durable BED or LOUNGE, please call at the Factory, 353 and 355 Tehama street, or at ROKOHL, BUTLER & PARK'S, Montgomery street, corner of Pine, and examine our Spring Mattresses and Lounges, before buying elsewhere.

OF NEW YORK.

Assets, - - over \$3,000,000.

Number of Policies Issued in 1867, 10,300.

Amount Insured, - - \$31,375,071 00.

POLICIES ISSUED AT ONCE,

On receipt of Application at the San Francisco Branch Office, without referring to the Home Office at New York.

Policies Paid in Gold Coin or Greenbacks, at the option of the person insuring.

[Extract from report of the Home Office, for Dec. 1867.]
"The Company's history for the past fifteen years shows favorably, and it stands to-day ranks it among first class Societies. It has carried out in good faith every contract made by it, never contesting a Southern claim during the war, while it is well known that many of our largest companies repudiated their Southern risks at the commencement of our National struggle, thereby increasing their assets. This honorable dealing of the Knickerbocker in the past, is a pledge of its future good faith."

CARD.

THE UNDERSIGNED, SINCE DISPOSING OF HIS

Gallery on Montgomery street, has seldom been in the

street without being asked where the best photographs

were taken. Now, for the benefit of his friends and the

public generally, he would recommend them to go to the

COSMOPOLITAN ART AND PHOTOGRAPHIC GALLERY,

No. 124 Kearny street, now owned and occupied by Messrs.

HALSEY & SCRIPTURE. Both of these gentlemen are

professional photographic artists—one of them having

been in the business more than twenty years—and cannot

be surpassed by any one in the State.

Persons wishing photographs taken will do well to give

them a call. The above named gallery is one of the finest

and most convenient in San Francisco, it being situated on

the second floor, and its proprietors are the most accom-

modating and gentlemanly men in the business.

N. B.—Prices as low as at any other Gallery in the city.

Solar Printing for the Trade.

Also Stereoscopic Views of California Scenery, at whole-

sale and retail, at the Cosmopolitan Art and Photographic

Gallery, No. 523 Kearny street.

HALSEY & SCRIPTURE,
Proprietors.**Mechanical Drawings.**

Persons wishing Mechanical Drawings can obtain the

services of competent draftsmen, by applying to this

office.

UNPROFITABLE ENGINEERING.—From the
United States Railroad Register for March
21st: "When the New York and Erie Rail-
road, under the stimulus of the State loan,
was begun at the Dunkirk terminus, and
was in progress throughout almost its en-
tire length in 1841, 90 miles of it, be-
tween Binghamton and Hornellsville, was
'piled' with upright posts, on which the
road was to rest, to be filled in underneath.
To effect this, an ingenious machine was
invented and put in operation, to drive and
saw off these piles with dispatch; and it is
melancholy to turn to the 'journals of the
day,' and see the enthusiastic records of
the daily progress of this wonderful driver
and cutter, as though every post driven
was an additional support on which was to
rest the future fortunes of the villages
along the route! Ninety miles were thus
posted up, when the treasury of the com-
pany became embarrassed, the work was
stopped, and the road at the point of death,
when it was resuscitated by calling in new
nurses and physicians. When the work
was again started, new and improved modes
of engineering showed that it would be
actually cheaper to throw aside the piled
route as useless, and run a new line. This
was done, and the track was laid as it now
is, leaving the said outposts to remain un-
used—a homely imitation of a Roman via-
duct, stretching across a wide campaign."SIMPLE CLOCK-WORK.—An electrical clock
in the rotunda of the Philadelphia Mer-
chants' Exchange has a running gear of the
simplest description, consisting merely of
two cog wheels and a ratchet wheel. The
driving power is supplied by a weak gal-
vanic battery, the currents from which,
transmitted through two galvanometer coils
placed one on each side of the clock-case,
act upon steel bar magnets set within the
pendulum hall. The latter swings between
the two coils, so that when one of them is
positively charged, the ball is attracted until
by contact it becomes similarly electrified,
and, consequently repelled, then swinging
over to the negative coil, it becomes nega-
tively charged, again repelled, and thus
the vibrations are kept up indefinitely, or
as long as the battery continues working.
The alternate positive and negative charges
are made and broken by a simple slide-bar
moved by a wire pin on the pendulum rod.NOW AND THEN.—Previous to the inven-
tion of the cotton gin by Whitney, cotton
was separated from the seeds by picking
with the fingers. Previous to the inven-
tions of Hargreaves and Arkwright, the
hand-spinning wheel was the only imple-
ment used for producing thread, and a
woman could scarcely exhibit two pounds
as the result of a day's labor. The ham-
moo hand loom of the East and the more
perfect implement of Europe have in turn
been thrust to the wall by the combinations
of the inventor. With the power-loom
one woman can now accomplish more than
a dozen strong men could with those anti-
quated implements. In the fourteenth cen-
tury none except the wealthy wore linen
garments, and those of a quality that the
laborer of to-day would disdain to wear.
Sixty years ago the working classes could
not afford to wear printed cotton garments;
now no fabric is furnished at a cheaper rate.
*Exchange.*THE INTERNATIONAL MARITIME EXHIBI-
TION.—A letter from Havre states that the
external part of the building for the mari-
time exhibition, to be opened there on the
first of June, is now almost completed.
Preparations are being made for receiving
and arranging the articles to be exhibited.
The fine arts are to occupy an important
place in the display. One of the principal
curiosities will be an aquarium one-half
larger than that of the Paris Exhibition,
and presenting an imitation of Fingal's Cave
in Scotland.NEW TELEGRAPH INSTRUMENT.—The Pitts-
burgh Commercial says a gentleman in Har-
rington, Pa., has lately invented a new
instrument, by which the rapidity of tele-
graphing is greatly increased. The Morse
system will transmit about 1,800 words per
hour, the House and combined system from
2,000 to 2,600, while a rate of 4,000 to 5,000
is claimed for the new one. The writing
bears a resemblance to manuscript. The
letters are traced with printer's ink, are ac-
curate, compact and easily read.FOSSILS IN ILLINOIS.—The Chester (Ill.)
Clarion says: Above the mouth of the Okaw
river, on the bluff, J. M. Christian recently
found the largest nautilus on record. It is
seven feet long, two feet wide and nine
inches in thickness. He now has it in his
possession. It is two feet four inches longer,
four inches wider, and about two inches
thicker than the largest one in the State
Geological Cabinet at Springfield.

NEW CONCRETE BUILDING-STONE.—The *Tribune* of March 25th, thus describes a new and successful plan for making silicate of lime for building purposes: Ground quick-lime is thoroughly mixed with clean, sharp sand, and is then subjected to the action of either superheated or high pressure steam, which slacks the lime and causes it to attack the silica. This process continues for from twenty minutes to ten days, according to the degree of heat employed, when the material is molded and compressed by a heavy steam hammer, into blocks of any desired form. The ordinary building block made by this process is ten inches wide and four inches deep, having a hollow space in the center six inches long by one inch broad; when the blocks are placed upon each other, so as to break joints, a continuous and connected series of air chambers will be formed within the wall. Thirty days exposure of the block, after it is first formed, to the air, produce an induration quite sufficient for all ordinary building purposes, but the block continues to harden for an unlimited period. A number of fine buildings have already been constructed of this material in Chicago. The endurance of this stone, when submitted to repeated freezing and thawing, is quite remarkable.

CASTING INGOTS OF A GIVEN WEIGHT.—Mr. Alexander Wilson, of the Cyclops Steel and Iron Works, Sheffield, has patented and specified improvements in the casting of ingots of steel, or other metal, to any given weight. For this purpose the ingot mold is placed upon the table of a weighing-machine, or upon a table supported by a steel-yard or weighted levers, or suspended from a spring balance; the ingot mold, and everything in connection with it, is then weighed. By adding the weight of the ingot to be cast to the weight of the ingot mold and its accessories he is enabled to make the ingots of any given and desired weight; any other arrangement for weighing the ingot mold and its contents may be employed if preferred, and in addition a registered apparatus may be adapted thereto.—*London Mining Journal*.

Changing the Address.—No charge is made for changing the address of this paper. To give all necessary information, write us plainly as follows: "Change address of the *Mining and Scientific Press* from Mr. ... at ... P. O., ... County, ... State, to Mr. ... at ... P. O., ... County, ... State. ... 186-"

B. D. WILSON & CO.

Support Home Manufactures.

California Pioneer Fuse

MANUFACTURING COMPANY,

MANUFACTURERS OF

HOSE AND TAPE FUSE.

A New and Superior Article for Blasting in very wet ground, or under water.

Great difficulty has heretofore been experienced by miners, and others in the use of Fuse, which has been subjected to deterioration from exposure to dampness during transportation, or during the great length of time which has passed between its manufacture and use. In addition to great painstaking in the manufacture of the California-made Fuse, the above and many similar objections are entirely obviated, and the operator can always depend with certainty upon the burning of his fuse.

It is often the case that extra lengths are required, as exploding tunnels, etc., longer than is furnished in the imported article. Fuse of every desired length or size can be made to special order, at the above manufactory.

Manufactory, Potrero, San Francisco.

Mining Secretary.

THE SUBSCRIBER, HAVING SERVED FOR THE LAST five years as Secretary of various mining companies, feels fully competent to serve in that capacity. Any parties wishing to secure the services of a Secretary can be accommodated on reasonable terms. Information given, and all necessary papers correctly made out.

Having had a long experience in the purchasing of goods and machinery for miners, parties in the mines will find it to their advantage, where purchasing agents are employed, to send their orders to the undersigned.

MOSHEIMER'S

Pioneer Mining School,

ASSAY OFFICE

—AND—

Metallurgical Works,

SAN FRANCISCO.

Having established the first Practical Mining and Metallurgical School in the United States, I would call the attention of gentlemen who may wish to obtain a practical knowledge of Chemistry, Metallurgy, etc., to the fact that I am now prepared to teach the following branches:

1.—Assaying of Ores, Metals, and other Mineral Substances.

2.—Metallurgy of Gold, Silver, Copper, Lead, etc., by Smelting, Amalgamating, Lixivation, etc.

3.—Gold Extraction, by Chlorine Oase; also, a modified process of the same, which is cheaper and quicker than the processes usually employed.

4.—Concentration.—Dressing of Ores.

5.—Construction of Furnaces, in which any kind of fuel may be used for Smelting, Roasting, etc., as well as the erection of any Machinery or Apparatus required in Metallurgy and Technology.

6.—Technology, or Chemistry as applied to any special branch of Manufacturing.

By my Practical Mode of Teaching, any person of ordinary ability can learn to assay Ores in three lessons, and the working of all the ordinary and refractory ores in a few weeks.

Gentlemen of almost every profession, who, within the last two years have graduated at my establishment, will bear testimony that from my instructions they have learned more in a few weeks than they ever expected to learn.

My charges are from \$50 to \$200.

Ores of every description assayed and worked
JOSEPH MOSHEIMER,

THE GOLDEN ERA.

Founded in 1852, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent.

THE GOLDEN ERA

Is the most universally popular of all the Weekly Journals. It presents forty-eight columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected matter. It is a welcome guest in Cottage and Cabin; the favorite at the fireside in city and country; the most useful, agreeable and altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe and elsewhere. Every household in the mountains and valleys, the cities, towns and mining camps of California, and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor. Inspired with the genius of the age, it is progressive, and aims not so much at distinction as a newspaper, as at honorable success in its capacity of a great Moralizing and Improving Influence, Exercising a positive power for good, and wielding a permanent influence, many able and eminent writers choose its columns as a means of communicating with the public. No effort will be spared to make it a thoroughly California newspaper, and worthy of the support of all classes of our citizens.

HUNTINGTON'S PATENT ELASTIC SPRING BOTTOM FOR BEDS AND FURNITURE.—A good bed is a luxury. Rich or poor, all are alike interested in every improvement looking to ease and comfort in the sleeping apartment. To the idle, no less than to the most industrious—although for reasons somewhat dissimilar—a good comfortable bed is a necessity, to quiet the excited nerves of the one, and rest the limbs of the other, weary and sore from the day's exertion. Messrs. Huntington & Torrey are now manufacturing at Nos. 353 and 355 Tehama street, in this city, a new style of spring mattress and lounge, which they flatter themselves is destined to supersede the wire-coil mattress, so well known in the market. The upholstery is done upon Huntington's Patent Elastic Spring—a California invention, patented Dec. 17, 1867, through the Patent Agency of the MINING AND SCIENTIFIC PRESS, by Mr. F. A. Huntington, of this city, and briefly noticed in our issue of Jan. 18th, 1868. The spring is composed simply of india-rubber bands, fastened to the lower end of standards, capped or padded on the top, the bands being also attached to each side of the cross-bars or boards of the bed, so that when a weight is placed upon the springs, the standards are pressed down between the openings, regaining their original position when the weight is removed; the ends of the standards projecting a little below the cross-bars. The object of the invention is to provide a cheap, durable and easy spring for beds, lounges, or other furniture. The following are some of the advantages claimed by the inventor for this spring:

1st. It retains its elasticity for any length of time,—the bed always looking well, when "made up."

2d. It will not cramp or bend over as is the case with the spiral spring.

3d. It is entirely noiseless,—there being no squeaking or ringing as with the spiral spring.

4th. The upholstery can be more firmly attached to this spring than to the spiral,—repairs as a consequence not being so often necessary.

5th. It is more easily and cheaply repaired. In the spiral spring bed, when it is necessary to replace even but one of the springs, the bed has to be taken entirely apart, involving an expense amounting to near the cost of a new bed. While one, or even the whole of the patent elastic springs, can be removed from the bed without disturbing a stitch of the upholstery, so that in case of accident to any of the springs, they can be replaced at a cost too inconsiderable to deserve mention.

EXTRAORDINARY.—At Desenzans in the province of Brescia, Italy, says the *Journal de Paris*, the Hotel de Porta-Vecchia, built upon piles on the shore of the Lake of Garda, is gradually sinking at the rate of about six inches a day; the ground floor has already disappeared. This immersion is taking place imperceptibly, and without any shock. Every means of preventing it have been employed, but without avail. Numbers of persons have come from a distance to witness this singular spectacle. The proprietor of the hotel, who was at first in despair at this misfortune, at length determined to charge a fee for admission to the house, and has already received a sum of money which will go far to compensate him for his loss. A scientific commission is about to visit the spot to open an inquiry.

GOLD QUARTZ IN SOUTH AFRICA.—Mr. Manch, a mineralogist and explorer, writes from Potchefstroom, Dec. 2d, 1867, that he has found gold-bearing quartz veins. One field is sixty miles long, and twenty broad. A letter from the same gentleman, dated two weeks later, is accompanied with a specimen of the quartz.

Important to Californians.—Many inventors have lately had their claims for Patents seriously (and in some cases fatally) delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of non-agent agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. The Mining and Scientific Press Patent Agency has strictly complied with the regulations of the Department, and properly filed all necessary papers as Claim Agents.

THE CIRCULATION of the Press, already extensive, is rapidly increasing, and substantial tradesmen who can profit by widely disseminating information of their business amongst the most intelligent, influential and industrial classes of the Pacific States and Territories, will find no more effective or economical medium for advertising.

ECONOMY in Advertising.—The MINING AND SCIENTIFIC PRESS is the best and most economical mining advertising medium in this city. Our terms are less than ONE HALF the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The Press contains, proportionally larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

ELECTROTYPING CUTS, ENGRAVINGS, ETC.—Our Job Printing Office is abundantly supplied with elegant engravings, ornaments, and other embellishments to suit the various branches of industry in this State.

DEWEY & CO., Proprietors.
Patent Agency and Job Printing Office, 505 Clay street, San Francisco.

AN INSTRUCTIVE BOOK!

Prof. LAYRES'

ELEMENTS OF COMPOSITION.

BELLES-LETTRES AND ORATORY

For Scholars, Teachers, Lawyers all Professional Persons, and those of Common

Education, who would improve the

Eloquence and Effectiveness

of their Composition and

Manners of Address.

Price, postage paid, \$1.10

This is a new publication, and in style and treatment of this important subject, is original, simple, plain and comprehensive. The author, Prof. LAYRES (a meritorious Teacher of good standing in California, and a sound thinker and reasoner), in his preface says: "The method pursued by the Author in developing the subject of Composition, is both the synthetical and analytical. The former is necessary to teach the theory, the latter the practice of the art; and as these are both indispensable to the scholar, so are also the two methods, as the sequel will show."

The Work has lately been approved and authorized by the State Board of Education for use in the Public Schools. To further illustrate the varied and popular endorsement the book has so rapidly received, we quote the following

RECOMMENDATIONS:

It is simple, concise, and well arranged. It seems to be a work of great value.—*John Siegel.*

I am prepared to concur in the recommendation of the Honorable Superintendent of Public Instruction.—*J. C. Patton.*

After as careful and thorough perusal of the same as it was in my power to give, I come to the conclusion that, for conciseness, correctness, and precision of definition, as well as for completeness and simplicity of style, it was, and would be, without a rival. I regard your work as the best of its kind. I know of but few men in any profession who would not be benefited by its careful study.—*Wm. H. Hill.*

I regard it as one of the best treatises upon these important branches—perhaps the only one obtainable possessing conciseness, comprehensiveness, and simplicity with conciseness, and of such simplicity in its arrangement as to be readily understood by the advanced pupil.—*F. W. Hatch.*

It is admirably arranged to develop the correct idea of the analysis and synthesis of language, and the application of ideas into sentences and periods. The style is clear, terse and pleasing. I do not hesitate to recommend it as a great acquisition to our text books.—*James Deman.*

I am happy to express my conviction of the value of the whole treatise. It would give me much gratification to see so thorough and excellent a treatise emanate from young California.—*Martin Kellogg.*

I recommend it to all those who wish to obtain a book that will give them definite ideas on this subject, and teach them to express their thoughts and feelings in a clear, simple, and forcible manner.—*Caroline L. Atwood.*

I regard the book about to be published as far superior to any work extant upon that subject.—*Wm. S. Hunt, A. M.*

I believe the work will be a valuable and much needed addition to our school text books.—*Hervon Perry.*

You have brought the results of a profound analysis, and made them available, in a practical form.—*I. M. Brayton.*

I can recommend it particularly to my young friends of the legal profession, as a source from which they may be able to learn much of value as special pleaders and as advocates at the forum.—*John Curry.*

The subjects upon which you treat have heretofore been too much neglected in the education of young men in America. Exactly enunciated to interest. It will soon become a necessity in every lawyer's library.—*Charles A. Tuttle.*

Its clearness and comprehensiveness make it easy.—*G. W. Bonine.*

A gentleman of varied learning and ripe culture, who has half a dozen languages at his tongue's end. He seeks to teach the student not only how to take sentences apart, but how to construct them. His system has the merit of originality. The student no work in which can be obtained so lucid an exposition of the elements of composition, and such valuable assistance in learning how to put his ideas into language. Prof. Layres has done the cause of popular education good service.—*S. F. Bulletin.*

This is a San Francisco book by a San Francisco author. It contains 166 pages, and is altogether creditable to San Francisco. It meets a public want, and meets it in a form and size cheap and convenient, and in reach of the humblest.—*Atlas California.*

The writer, the lawyer, the minister, or the statesman, may study its rules and definitions with profit. Nothing conduces more to the purity of a national literary taste than a general and thorough knowledge of the rules by which the construction of language is governed.—*S. F. Times.*

Prof. Layres plunges at once "in medias res." To solve a sentence (which is the unit in composition, whether written or spoken), holds it up before you; tears it to pieces before your eyes—or rather, we should say, neatly and skillfully dissects it—displays one by one its several parts; makes you thoroughly acquainted with each, in its entirety; and then shows you how to put them together again. A series of such experiments, increasing in complexity as gradually that you do not feel the difficulty, and the thing is done; you are master of the subject.—*Mining and Scientific Press.*

Its design is to show that ideas can be so arranged as to increase their power; in short, to teach the mechanism of composition, eloquence and oratory. A desideratum long felt supplied.—*S. F. Examiner.*

This is an age in which the occasions are rapidly multiplying, when educated men and women, too, are called upon to express their views in writing, either for public or private inspection and criticism.—*Stockton Independent.*

The most eminent educators in California give it their hearty approval, and we concur.—*Marguerite Appad.*

Not only one of the best of its kind, but, what is still better, one of the briefest. It contains 166 pages.—*Virginia Enterprise.*

Price, \$1.10. Sent by mail, postage paid, without extra charge. Liberal reductions made to the Trade, Teachers and Schools, ordering by wholesale. Orders received by our Traveling Agents.

THE BEST IN AMERICA.

The Mining and Scientific Press,

is the Largest and Best MINING AND MECHANICAL Newspaper issued in the United States.

DEWEY & CO.,

Patent Agents, Publishers, Book and Job Printers, 505 Clay Street, San Francisco.

THE MINING AND SCIENTIFIC PRESS is published every Saturday. Each issue comprises sixteen pages (64 columns), and furnishes more valuable reading matter than any other weekly journal in California.

To the practical mechanic, metallurgist, prospector, millman, mine holder or worker, it is worth many times its subscription price. Its files contain a record of the improvements in mining machinery, the progress and development of the mines, and all new methods and processes for working and

SAVING PRECIOUS METALS.

All progressive information, in fact, transpiring with the times—which cannot be obtained from books.

The MINING AND SCIENTIFIC PRESS is now in its Sixty-sixth Volume, and enjoys a large circulation. It received the following hearty endorsement of the California Miners' State Convention, held at Sacramento, January 17th, 1886:

Resolved, That we regard a mining paper or journal of great importance to the mining interests of California, and recommend the MINING AND SCIENTIFIC PRESS, of San Francisco, to the consideration and support of the miners of the Pacific coast.

Terms of Subscription.—One year, \$5; six months, \$3.—In advance. Send for sample copies. Remittances may be made by mail at our risk. All parties sending will register their letters, or send money order.

AS AN ADVERTISING MEDIUM throughout the whole Pacific States and Territories, the Press is unsurpassed. Rates moderate.

SPECIMEN NUMBERS of the Press and Patent Circulars, sent free.

Rattlesnake Gold and Silver Mining Company, Brown's Valley, Yuba County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-eighth day of April, 1883, an assessment of two (\$2) dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, 315 California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the twenty-ninth day of May, 1883, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the fifteenth (15th) day of June, 1883, to

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the
PACIFIC FOUNDRY,
1st
San Francisco.

SUPERIOR CUT-OFF ENGINES.

We desire to call the attention of Engineers, Manufacturers, and Millmen, to the celebrated

Hartford Engine,

With Wright's Patent Variable Cut-off, which we are now manufacturing under a license from the Woodruff & Beach Iron Work Co., Hartford, Ct. To parties wishing a First-class

Fuel-Saving Engine,

Simple and durable in construction, this Engine is offered in the belief that it is superior to any other manufactured. It enjoys the very highest reputation in the Atlantic States, where it is well known; over 300 of them having been built by the Woodruff & Beach Company, and being now in successful operation.

San Francisco.

BLAKE'S PATENT
QUARTZ CRUSHER.

CAUTION!

The owners of the Patent for this valuable machine, in order to facilitate the protection of their rights against numerous infringers, procured, some time since, a reissue of the Patent, bearing date January 9th, 1866.

This Patent secures the exclusive right to employ in Stone-Breaking Machines Up-right Convergent Jaws, actuated by a Revolving Shaft.

All persons who are violating the Patent by the unauthorized making, selling or using machines in which quartz or other materials are crushed between upright convergent jaws, actuated by a revolving shaft, are hereby warned that they are appropriating the property of others, and that they will be held responsible in law and in damages.

Several infringing machines are made and offered for sale in this city, upon which Patents have been obtained. Manufacturers, purchasers and users, are notified that such Patents do not authorize the use of the original invention, and that such machines cannot be used without incurring liability for damages.

BLAKE & TYLER,
1414 1st

Agents for the Pacific Coast.

NOTICE TO MERCHANTS

-AND-

MANUFACTURERS.

Moore's Patent Friction Hoist.

Now in successful operation in the principal stores in San Francisco, possesses many advantages over the common Hoist—viz: Greater strength; less danger in working, as goods require no slinging or landing, consequently make fewer breakages; requires one man less to operate it; stops with the goods in any position, without any jostling or attention from the operator.

The undersigned take this opportunity to notify all whom it may concern that they have secured, by letters patent, the application of a friction pawl, or stop, to hoisting machines, and that they will prosecute any party making or using any machine infringing upon the same.

Brodie's Patented Improvements

FOR THE TREATMENT OF

Gold and Silver Ores.

BRODIE'S PATENT IMPROVED QUARTZ CRUSHER.

The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:

No. 1.—Or 0 inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price.....\$600
No. 2.—Or 10 inch Crusher, capable of similarly putting through five to six tons per hour..... 850
No. 3.—Or 18 inch Crusher, will in a similar manner crush from seven to eight tons per hour..... 1,200

EXPLANATION OF THE ABOVE ENGRAVING.
The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable jaw, and the link or radius bar. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the opening. F, which can be regulated at pleasure, so as to graduate to the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, B, gives the movable jaw, D, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne county:—
"RAWHIDE RANCH, Tuolumne Co., Sept. 28, 1866.
JAMES BRODIE, Esq., San Francisco—My Dear Sir: It gives me pleasure to inform you that I have for the past three months had one of your latest sized Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which has entirely met my expectations; and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly,"
Supt. Rawhide Ranch Quartz Mill.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco in 1864. Further particulars will be afforded on application to the subscribers.

For the present it is not intended to grant licenses for the use of the Improved German Barrel, for a longer term than twelve months. All persons desirous of procuring, without having recourse to legal proceedings, for past infringements, or desirous of receiving Letters of Grace to the limited period named, are requested to address as below.

A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press, of Sept. 22, 1866.

It is an UNFAILING REMEDY in all cases of Neuralgia Facialis, often effecting a perfect cure in less than twenty-four hours, from the use of no more than two or three PILLS.

No other form of Neuralgia or Nervous Disease has failed to yield to this

WONDERFUL REMEDIAL AGENT.

Even in the severest cases of Chronic Neuralgia and general nervous derangements,—of many years standing,—affecting the entire system, its use for a few days, or a few weeks at the utmost, always affords the most astonishing relief, and very rarely fails to produce a complete and permanent cure.

It contains no drugs or other materials in the slightest degree injurious, even to the most delicate system, and can ALWAYS be used with

PERFECT SAFETY.

It has long been in constant use by many of our most

EMINENT PHYSICIANS, who give it their unanimous and unqualified approval. Sent by mail on receipt of price, and postage.

	Price.	Postage.
One package.....	\$1 00	6 cts.

ARTIFICIAL GEMS.—At a recent meeting of the Polytechnic branch of the American Institute, Dr. Van der Wyde gave the following facts: Artificial diamonds are made of flint glass, and known as pastes. The Alaska diamonds are made of the same material. An imitation of a \$300 diamond can be made for \$3, and no one can tell it from a genuine except by handling it. In selecting pastes, compare them with a real diamond, and the one nearest like the true gem will be always the best. Another way is to examine the stones with a strong glass, and if no air bubbles can be seen, then they are of the best quality, for in pure gems no imperfections are seen. Pure diamonds are unchangeable. Cheap stones, such as are sold "by the peck," are pressed when hot into the desired pattern, and then cut or ground. Twenty years ago artificial diamonds could be easily detected, as they were whiter than real gems, which have a peculiar dark transparency. Real diamonds are much colder to the tongue than artificial ones.

In this connection, we may add that the following is said to be a method of imitating gems which has been patented by the Superintendent of the Royal Porcelain Works at Berlin, Prussia: The base is a flux obtained by melting together 6 drachms of dry carbonate of soda, 2 drachms burnt borax, 1 drachm saltpeter, 3 drachms minium, and 1½ ounces of purest white sand. To imitate in color the following gems, add to the flux the ingredients named in connection with each:

Sapphire.—2 grains carbonate of cobalt.

Opal.—10 grains oxide of cobalt, 15 grains oxide of manganese, and from 20 to 30 grains protoxide of iron.

Amethyst.—4 to 5 grains carbonate of peroxide of manganese.

Gold Topaz.—30 grains oxide of uranium.

Smaragd.—20 grains protoxide of iron, 10 grains carbonate of oxide of copper.

Beryl.—10 grains protoxide of iron.

PROPORTIONS OF THE HUMAN FIGURE.—

Mr. Z. P. Pemberton recently delivered a lecture before the Polytechnic branch of the American Institute upon *Geometry in Nature and Art*. The following is quoted from the lecture, as reported in the *American Journal of Mining*: The proportions of the human figure are strictly mathematical. The whole figure is six times the length of the foot. Whether the form be slender or plump, this rule holds good. Any deviation from it is a departure from the highest beauty of proportion. The Greeks made all their statues according to this rule. The face from the highest point of the forehead where the hair begins, to the end of the chin, is one-tenth of the whole stature. The hand, from the wrist to the end of the middle finger, is the same. From the top of the chest to the highest point of the forehead, is a seventh. If the length of the face from the roots of the hair to the chin, be divided into three equal parts, the first division determines where the eyebrows meet, and the second the place of the nostrils. The navel is the central point of the human body, and if a man should lie on his back with his arms extended, the periphery of the circle which might be described around him, with the navel for its center, would touch the extremities of his hands and feet. The height from the feet to the top of the head is the same as the distance from one extremity to the other when the arms are extended. These are the general measures of the species.

A NATIONAL SCHOOL OF MINES.—The

American Journal of Mining has the following upon this subject: "Such an institution would increase the production of bullion in three ways; first, by sending forth educated engineers, able to meet and overcome the growing difficulties of gold and silver mining and reduction; second, by affording information to thousands who are too old or too busy to receive thorough instruction, but who, being actively engaged in mining, most urgently require that counsel which will save them from unnecessary losses and disappointments; and finally, by making the capitalists of Europe, as well as America, acquainted with the mineral resources of our country, and drawing to our great mining regions that capital which (next to knowledge) is their prime necessity."

NAPHTHA IN THE CAUCASUS.—The belief expressed by some geologists that naphtha would be found in the Caucasus has been realized. A boring, 276 feet deep, near Knaaco, has struck a source of this liquid, which yielded 1,500 barrels daily for one month; more recently a second source has been discovered near the former, from which the naphtha jets to a height of forty feet above the ground, and flows out at the daily rate of 6,000 barrels.

VARIOUS USES OF SEWAGE.—An experiment is being made at Asnières, near Paris, on a field of about 2½ acres in extent, and situated about 300 yards from the mouth of the great sewer sink. Two portable steam-engines pump 500 cubic meters of sewage water into a receptacle at one end of the field. A part of the liquid is applied directly to various crops, and the remainder is treated with chemical agents for its purification and conversion into valuable compounds. M. le Chatelier has expressed the opinion that the cultivated lands around Paris can never absorb a considerable portion of the sewage-water, because, first, the land is divided into small allotments, which increase the cost of distribution; second, the principal arable lands lie on high plateaux sloping contrary to the direction of the streams, and great difficulty would be found in getting rid of the excess of water by drainage.

TREATMENT OF WINE BY HEAT.—The late discovery of M. Pasteur, that wine heated to the temperature of 60° C. (140° Fah.) will neither turn, become diseased, nor deposit sediment, has been applied in practice at the Longworth Wine-House in Cincinnati with decided success. Maj. Anderson, the present proprietor of that establishment, constructed a heating chamber capable of holding 2,000 bottles of wine. Some of the wine heated was afterward exposed to the sun for four weeks, and only became more clear; while other wine of the same kind, not heated by similar exposure, showed traces of sediment. Dry wine in casks can be heated to the same point, and thus indefinitely preserved. The process is said to act as a restorative where wines have degenerated.

Wood & Mann's Portable Steam Engines, 6, 8, 10, 12 and 15 horse power,

With newly invented Water Bottom, which entirely surrounds the fire grate and ash-pit, forming underneath the ash-pit, as up the sides of the furnace, a three or four inch water space, by which additional heating surface is obtained, the accumulation of sediment around the fire-box or furnace is entirely prevented, and renders it perfectly safe to use near any barn, or in any farm-yard, or in any building where a stove would be allowed, as no sparks can possibly escape from the furnace or ash-pit. The sediment has a free passage to the bottom of the fire-box, and can be blown off daily by the blow-off cock underneath the ash-pit, by which means the boilers may be kept clean much longer than under the old system. The great saving in repairs which is effected by the use of these water bottoms, and the constantly increasing demand for them, prove their superiority to any others yet constructed.

"The Excellent"
Will not repair broken linings or leaky roofs; but it will quiet the nervous and brace up the weak. It will give more comfort to those suffering from dyspepsia or indigestion than any preparation you ever tasted or heard of. The first physicians use it, and it is made by
BARRY & PATTEN,
8½ 16-3m 413 Montgomery street, San Francisco.

The American Spring Bed.
THIS BED, NOW SO POPULAR IN THE EASTERN and Western States, was patented August, 1855. For practical utility, comfort and durability, it is unsurpassed. It is easily applied to any bedstead. It is portable, and not liable to get out of order. The price is about one-fourth that of the spring mattress. It combines elegance with cheapness and comfort. Call and see it. Mechanics' Institute Building, No. 29 Post street, San Francisco. 8½ 16-3m

VEGETABLE PARCHMENT.—In 1841, Wm. Gaine, an English engineer, in the course of certain experiments, found that unsized or "blotting" paper, dipped into sulphuric acid diluted to a certain extent with water, undergoes a remarkable change, assuming the appearance of membrane. This product has been named "vegetable parchment." It is scarcely affected by acids or alkalis. If wet with water, it becomes soft, but on drying resumes its former condition. It withstands the action of boiling water, which animal membrane does not. If submitted to chemical analysis, it is found to be composed of the same elements as before it underwent its transformation. This change is effected in a few seconds. The gelatinous sheet, on leaving the acid is placed in water, to free it from any of that acid which may remain; and then, to secure this end more completely, in a weak solution of ammonia. It is then a tough, elastic skin-like substance. The acid used is that of specific gravity 1.845, diluted with half its bulk of water. Specimens of this parchment made at the date above named, 1841, remain unchanged. "The rapid conversion of such a material as blotting paper, so easily torn, and so readily disintegrated by water, into a substance that bears an indefinite amount of rubbing and washing, has almost the effect, on the beholder, of a conjuring trick."

This vegetable parchment is now made in quantity. Its chief use, until recently, has been for covering cans of preserved fruits. In 1861, Prof. Graham found that it was especially suited for use in his experiments in dialysis; and it has therefore been used in the purification of sugar, and in the analysis of the stomach's contents for poisons, in medico-legal investigations. It answers the purpose much better than the animal membrane at first used. In 1865, it began to be employed for enveloping the gun-cotton cartridges used in blasting. Tea, packed in it, is said to retain its flavor far more perfectly than when packed in any other way. The patent having expired in December last, while, owing to various difficulties attending the early manufacture of the article in quantity,—and other causes,—the remuneration to the inventor has been very small, the English Government extended it for five years longer.

THE CHINESE EMBASSY.—The grand banquet given to the Chinese Embassy by the leading men of San Francisco, came off on Tuesday evening last, in the splendid dining hall at the Lick House. No expense was spared in the decorations, which were not rich only, but in the most perfect taste. In response to the regular toasts, speeches were made by Hon. Anson Burlingame, and Chih Tsien of the embassy, and by Gov. Haight, Hon. Delos Lake, Major-General Halleck, Admiral Thatcher, Newton Booth, Wm. A. Howard and others. In the course of his speech, Mr. Burlingame briefly alluded to the coöperative policy of the Treaty Powers; and remarked that although he could not then speak at length of the objects of the mission, he would say that "it means progress. It means that China desires to come into warmer and more intimate relations with the West. It means that she desires to come under the obligations of international law, to the end that she may enjoy the advantages of that law. It means that China, conscious of her own integrity, wishes to have her questions stated—that she is willing to submit her questions to the general judgment of mankind. It means that she intends to come into the brotherhood of nations. It means commerce; it means peace; it means a unification in its own interest of the whole human race." Mr. B. was warmly applauded. At a late hour the party broke up, well pleased with the entertainment.

The Embassy sailed on Thursday's steamer for New York.

WORKMEN are engaged finishing the last corner of Friedlander's extensive warehouse at North Point.

HENDY'S LATEST IMPROVED PATENT SELF-DISCHARGING SULPHURETS CONCENTRATOR.

FOR GOLD AND SILVER ORES,

With Revolving Stirrers and Rotary Distributor.

This machine is designed for saving finely divided Quicksilver, Amalgam and Gold from the sands, and for concentrating and saving the Sulphurets. Any person of ordinary experience with Quartz Mills can readily fit them up and run them.

Those in want of Concentrators would do well to visit some of the quartz mills that have Hendy's Patent Concentrators in use, and satisfy themselves before purchasing other Concentrators of pretended merit. **THEY ARE WARRANTED TO WORK SATISFACTORILY.**

Directions for Operating Hendy's Concentrators:

The sulphurets are drawn off while the Concentrator is in motion, in the following manner:
FIRST—In setting up, set the pan, A, level by the inner rim, near its center.
SECOND—While in operation, keep the Pan, A, about half full of sulphurets. [See Figure 2, marked S.]
THIRD—Open the gate, E, sufficiently to discharge the sulphurets as they accumulate over the amount above mentioned.
FOURTH—The crank shaft to make 200 to 220 revolutions per minute.

References:

Reference is made to the following mills, which have HENDY'S CONCENTRATORS in use:

EMPIRE MILL. (3 Concentrators).....	Grass Valley, Nevada County.
NORTH STAR M. & M. CO. (3 Concentrators).....	Grass Valley, Nevada County.
NORRIDGEWOOD MILL. (2 Concentrators).....	Grass Valley, Nevada County.
VALENTINE & CO. Commercial Mill (3 Concentrators).....	Nevada County.
HUMBOLDT CANAL CO. (1 Concentrator).....	Humboldt County, Nevada.
ROBINSON & McALLISTER M & M. CO. (3 Concentrators).....	Hazler's Valley, Mariposa County.
PLYMOUTH ROCK MILL CO. (2 Concentrators).....	Calaveras County.
MIDAS MILL CO. (4 Concentrators).....	Virginia, Montana.
GOULD & CURRY G. & S. M. CO. (4 Concentrators).....	Virginia City, Nevada.
VULTURE CO. (5 Concentrators).....	Prescott, Arizona.
NOYES & CO'S MILL. (2 Concentrators).....	Prescott, Arizona.
LUCY MINING CO. (3 Concentrators).....	Owyhee District, Idaho.
MOREY & SPERRY (1 Concentrator).....	New York.
GUADALUPE & SACRAMENTO G. & S. M. CO.....	Smalpa, Mexico.
EL TASTE CO. (2 Concentrators).....	Sonora, Mexico.
B. F. BROWN (1 Concentrator).....	Melbourne, Australia.
JAMES HENDY & CO. (1 Concentrator).....	Melbourne, Australia.

And in use at many other parts of this coast.

The following give additional proof of the increasing popularity of the machine:

SAN FRANCISCO, October 10th, 1867.
J. HENDY, Esq.—Dear Sir:—To your request for an expression, in writing, of my opinion in regard to the merits of your Concentrator, I reply, that I consider it the best machine for saving quicksilver and amalgam, and for concentrating sulphurets, that I have ever used, or seen used. I may add, that I could give you no stronger proof of this than to order, as I did, six more of them, after a trial of one for several months. I shall take pleasure in showing the machine in operation to any one interested, who will call at the mill of the Empire Company, in Grass Valley. Yours,
S. W. LEE, Supt.

NORTH STAR MINE, Grass Valley, Feb. 26, 1868.
J. HENDY, Esq.—Dear Sir:—In answer to your request, I give my opinion in regard to the eight Concentrators we have at work. We have had one at work on blanket washings for the past three months, and it has proved highly satisfactory in saving sulphurets and amalgam, that in past years we have been losing. Of the other seven, six are taking the pulp from the batteries, and the remaining one concentrating from the six, which, when thus reconcentrated, yield 95 per cent. of pure sulphurets. Respectfully, etc.
W. H. RODDA, Supt.

SUPERINTENDENT'S OFFICE, GOULD & CURRY S. M. Co.,
VIRGINIA CITY, Nev., Sept. 17, 1867.

JOSHUA HENDY, Esq., San Francisco:—Dear Sir:—According to the terms under which I secured from you four (4) of your Concentrators, namely—that they were to be paid for only after a thorough trial had demonstrated their value—I desire to inform you that I have tried them, and have found them to work very satisfactorily, and that they will now be accepted by the Company. You will please present the bill for said Concentrators, say \$1,200, at the office of the Gould & Curry Company in San Francisco. Yours, very truly,
LOUIS JANIN, Jr.

The bill was presented in accordance with the above request, and duly paid.

Four Concentrators have been forwarded to the Vulture mine, in Arizona, which makes eight for that mill. The additional order for four machines was made after a thorough trial, which proved their superiority over all others. [See Mining and Scientific Press of Dec. 14th.]

CAUTION.

All of HENDY'S PATENT CONCENTRATORS are marked thus:

"J. HENDY, Patented February 27th and April 17th, 1866."

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1849, and endowed with the National Land Grant in 1865, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING. 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY. and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, \$125 per year of forty weeks.
The Libraries, Museums, Laboratories and Apparatus, accessible to students, are various and extensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 1866-1867

Adams' Improved Boat-Detaching Apparatus—Illustrated.
The American Anti-Incinerator.
Beance Oocks and Dry Docks.
Rosen's Lock.
California Academy of Sciences.
The Wheat Crop of 1868.
Mining Near Boise City.
Formation, Distribution and Age of Igneous Rocks.
Resources of Idaho.
Betting Tone by Electricity.
Prison Bells.
Total Miles of Telegraph.
The Old Engine at Curzon.
Nitro-Glycerine as a Poison.
The Carbon Prints.
San Francisco Market Rates.
San Francisco Mining Shareholders' Directory.
San Francisco Metal Market.
New Patents and Inventions.

MECHANICAL MISCELLANY.—
Manufacture and Wear of Balls; The Lullie, Delicate Iron Gun; Mirrors for Steel Making; Blast Furnaces; Safety Valves.
SCIENTIFIC MISCELLANY.—
Influence of Light on Infusoria; Interesting Electrical Experiments; Sensitive Flames; Chlorophyll and Chlorides; Baryta White; Chemists' Cement; Infusoria in Whooping Cough.
MISCELLANEOUS.—
Late Intelligence from the various counties and districts in California, British Columbia, Colorado, Idaho, Nevada, New Mexico and Oregon.
San Francisco Weekly Stock Circular.
Notices to Correspondents.
New Incorporations—List of Offices.
Stock Prices—Bid and Asked.

THE SANDWICH ISLANDS.—The terrible convulsions of nature which the last advices from the Hawaiian Islands describe, are perhaps without parallel in the history of such events within the memory of living man. Mauna Loa, one of the largest volcanoes upon the island of Hawaii, burst forth on March 27th, without premonitory showing, in the most frightful eruption ever known upon that group. The stream of liquid fire, one-fourth of a mile in width, rushed down the mountain at the rate of ten miles an hour; overwhelming and burying in its course, houses, cattle and crops, and forcing the people to flee for their lives. Then followed a frightful ten days of almost continuous earthquake shocks. Some of these shocks were most appalling in their violence;—the swaying having no definite character, but being "up and down, round and round, to and fro, in every imaginable direction." Houses were prostrated; the earth opened,—making large fissures in which men and flocks were swallowed up. The district of Kan, one of the most fertile and flourishing upon the islands, is a field of desolation. About one hundred lives were lost; all natives. Half a million of dollars would not make good the market value alone, of those homes of a month ago, which no money can restore. A tidal wave, some sixty feet in height, came rolling in from the sea at Ninole, in the above-named district, submerging and taking back with it, horses, cattle and men. A man who had gone on horseback several miles up the mountain, saw this wave sweep off, in an instant, the home and family which he had left an hour before, leaving nothing but a barren rock in their place.

ANOTHER FOUNDRY has been added to the numerous establishments of this kind already in operation in this city. The Messrs. Thompson Brothers have recently put up a large new structure on Beale street, east side, between Mission and Howard, which will be known as the Eureka Foundry, designed for turning out castings of every description, both heavy and light. These gentlemen have been connected with some of our leading foundries almost from their infancy on this coast, and hope, from their long experience and the extensive acquaintance formed in connection with this class of manufacture, to render good satisfaction and secure a full share of patronage.

Adams' Improved Boat-Detaching Apparatus.

We have here another important California invention, relating to that class of mechanism known as boat-detaching apparatus, and which consists, first, of an improved device for the instant detachment of boats from the davits; and second, in so combining it with the block as to make it easily applicable to any apparatus from which it is necessary to detach promptly. The object of this class of inventions, as is quite generally known, is to render the escape or disembarkation from ships at sea a more easy and safe operation than is possible with the detachment of the boat from hooks as in ordinary use. We have already described and illustrated one California invention for accomplishing this object,

the lever coming in contact with any substance and throwing open the jaws, thus releasing the weight and allowing it to fall. A pin, C, is placed over the lever, which, by being pushed into holes in two projections on top of the lever, D, fastens the lever rigidly, so that it will operate the joint, and when the joint is closed the finger may be inserted in the ring shown at C, and the pin withdrawn, when the lever, G, will drop out of the way of any rope or other obstruction which might otherwise strike it down and release the weight. This is rendered necessary on account of the ease with which the joint operates when carrying a load on the jaws, F, the slightest blow being sufficient to release the weight.

This apparatus will be found not only a benefit as a boat-detaching block, but will

THE MECHANICS' INSTITUTE.—The regular monthly meeting of the Mechanics' Institute was held in the lecture room of the Institute Building on Thursday evening. There was a large attendance, and among other business the following resolution, offered by Gen. A. M. Winu, was unanimously adopted:

Whereas, differences of opinion exist among the members of the Mechanics' Institute in relation to the management of the coming Fair, which have been settled by the election of a President and Board of Directors by an unmistakable majority; and whereas, their recommendations presented subsequently were ratified by the Institute; and whereas, this, like every other association of citizens, can only succeed by submitting to the will of the majority; therefore be it

Resolved, That it is a duty we owe each other to use our industry and our influence to make the Fair a success, and cease all opposition to the plans laid and carried out by the majority.

By reference to our advertising columns, it will be noticed that the Board of Directors, advertise that the Institute will hold an Industrial Exhibition in Union Square in August next. A plan of building has been adopted, and preparations for the erection of the structure are in a condition of forwardness. Circulars are to be issued to the general exhibiting public, and every effort will be used to make the proposed Exhibition the most valuable and attractive ever held on the Pacific Coast.

BUSSEY'S LOCK.—SALE OF PATENT RIGHT. As an evidence of the growing popularity of this lock, we may mention that an assignment was made out and passed at our Patent Rooms, a few days since, assigning to a party resident in Amador county the right for the sale of this lock in the State of Pennsylvania for the sum of \$5,000. The party purchasing expects to treble his money within the first year after his arrival in the Keystone State. Those interested in such things are beginning to realize the benefits of this new lock, and Mr. B. is fast receiving orders for the same. He has recently invented an improvement on the original lock, by which he requires only one knob to draw the bolt and adjust the combination. The first of these locks put into actual use was at the Bank of British Columbia, in this city, some two years ago, where it has been in constant use ever since, giving the fullest satisfaction. This lock, it should be remembered, has neither key nor key-hole—a circumstance which renders it perfectly safe against the common burglarious attempts to blow it open with gunpowder. Mr. Bussey is now finishing a large lock for a bank in Oregon.

THE NEW WORK ON CALIFORNIA.—The new work to be entitled "Natural Wealth of California," by T. F. Cronise, will be issued by H. H. Bancroft & Co., the coming week. The impatience manifested for the appearance of this work, gives promise of a large sale for the same. The right to publish future editions of the book, in the States and Territories east of the Rocky Mountains, has been sold by the author for \$7,500.

ADAMS' IMPROVED BOAT-DETACHING APPARATUS.

which has attracted much attention in both America and Europe. So important is the successful accomplishment of this object held, that several of the European governments, as well as our own, have manifested much interest therein. The Emperor Napoleon, especially, has taken a personal interest in this matter as one of the highest importance in the cause of humanity.

Fig. 1 represents a side view, with two of the plates broken away, so as to exhibit the interior mechanism. The block is divided into three compartments, by metal plates; the two outside compartments being provided with sheaves, etc. The detaching apparatus consists of two bent levers, E, E, hinged together at I, the short arms, F, F, forming the jaws by which the boat is suspended. The long arms have hinged to them two short levers, one of which is shown at B, and which are pivoted together at D, thus forming a toggle-joint, which, when suddenly operated by the lever, G, instantly opens the jaws, F, F, as shown by the dotted lines in Fig. 2.

After the joint has been closed by striking up the lever, G, to avoid the liability of

be useful for warehouses and other places where great weights are handled, from its ease of fastening upon heavy articles, and also the ease of detaching it; while from the nature of the joint, the greater the weight the more firmly do the two jaws come together, rendering it impossible to drop the weight when the lever is down, unless some portion of the block should give way. It can also, with a slight modification, be employed on the cat head of a ship, for the purpose of holding and releasing the anchor.

COMMENCEMENT DAY.—The Commencement Exercises of the College of California, at Oakland, will take place on the 5th of June. The Commencement oration will be delivered by Rev. J. A. Beaton; the alumni address by Rev. Dr. J. E. Dwinelle; the poem by Charles W. Stoddard. Rev. A. L. Stone will preside at the supper. The organization of the new University of California, into which the present College will be merged, will add especial interest to the occasion.

CONTINENTAL Life Insurance Company, 302 Montgomery street, corner of Pine.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

Formation, Distribution and Age of Igneous Rocks.

[Continued from page 274.]

"Whatever may have been the origin of the globe, we are warranted in stating that granitic rocks form a solid crust or basis upon which all the systems of strata rest. As to the origin of the gneiss and mica schist systems, it is abundantly evident, that the materials of which they are composed, were derived from the underlying granite.—*Elements of Geology, by David Page.*

"The stratified rocks received their structure through the immediate agency of water. But the materials of many of them, especially of older strata, were evidently derived directly from the igneous rocks. The composition of gneiss, which is believed to be the oldest stratified rock, is identical with that of granite. Granite often passes into gneiss, so gradually as to show that in early times the same materials were alternately acted upon by fire and water, and that they existed at one time in an unstratified, and at another in a stratified condition. The various classes of slates, as mica slate, talcose slate, and argillaceous slate, appear to have been derived from granitic rocks, which had been subjected to chemical and mechanical agencies. In different parts of the stratified series, we often find conglomerates which are composed of pebbles of igneous and aqueous rocks, cemented together by finer materials. From the above facts, it is an obvious inference that the whole crust of the globe, accessible to observation, was once in a melted state.—*Elements of Geology, by Adams & Gray.*

"The unstratified rocks usually occur in irregular masses, sometimes overlying other rocks, or in veins cutting across the layers of stratified rocks, or forming beds interposed between the strata. Modern lavas and ancient granites are alike unstratified rocks, having been erupted in a melted condition, at different periods in the history of the earth. The unstratified rocks which are now erupted from volcanoes, have their source beneath all other known rocks; and it is inferred from various data, that those of ancient date were in like manner erupted from beneath the then existing rocks. Going far back into the geological history of the globe, we come to a period when the oldest and lowest stratified rocks rested alone upon granite,—the oldest of the unstratified. Beneath are doubtless, in immense irregular beds, the reservoirs from which the eruptions of the igneous rocks had their origin, and above we have the successive strata, whose contents reveal the physical history of the earth.—*Ibid.*

The foregoing extracts from standard authors, show what are the opinions of geologists as to the origin of the rocks, stratified and unstratified, overlying the original granite. Now all the rocks, stratified and unstratified, with the exception of pure silica, are ores. Some of them, such as granite and syenite, greenstone, serpentine, etc., and the stratified rocks which were derived from them, are the ores of such metals as sodium, potassium, calcium, strontium, magnesium, etc.; while others contain a large percentage of aluminum. Now all these rocks, or the material composing them, was erupted, and why should not the rocks, carrying the useful and precious metals have also been erupted, since metal bearing quartz, altered and unaltered, exists in such enormous bodies. When we come to examine the huge deposits of quartz conglomerates and auriferous gravels, in place, we shall find it impossible to account for their existence and the phenomena attending them upon any other hypothesis.

"There is much difficulty in explaining," says Humboldt, "the origin of the beds of pure quartz, which occur in such large quantities in South America, and impart such a peculiar character to the chain of the Andes. In descending toward the South Sea from Caxamarca toward Guanamarcá, I have observed vast masses of pure quartz, from 7,000 to 8,000 feet in height, superposed, sometimes on porphyry devoid of quartz, and sometimes on diorite."

Hugh Miller describes (in *Old Red Sandstone*) the assynt deposits of quartz conglomerate, which are situated on the west coast of Scotland, and are thousands of feet in thickness. He is of the opinion that these huge deposits are a part of, and belong to the old red sandstone system. This deposit is situated high up on the flank of the range of mountains composing the backbone of Scotland; is 150 miles in length, and rests unconformably upon the gneiss. I see no reason why it might not, in some of its lower beds, prove to be auriferous.

Let us now examine some of the immense quartz gravel deposits of our own country, which we know to be auriferous. "In the first place," says Prof. Whitney, in speaking of the vast auriferous gravel deposits on the western flank of the Sierra Nevada, "these deposits are not of marine origin, as is proved by the fact, that, although frequently found to contain impressions of leaves, masses of wood and imperfect coal, and even whole buried forests, as well as the remains of land animals, and occasionally those of fresh water,—not a trace of marine production has ever been found in them." As showing the great antiquity of these deposits, he further says, "for now these deposits of gravel and overlying volcanic materials, instead of occupying the depressions of the surface, are found on the high plateaux between the present cañons and flat-topped ridges, known as table mountains, hundreds, and even thousands of feet above the present river beds. Thus the topography of the country is exactly the reverse of what it was at the time of their deposition; what were then valleys are now ridges, and the ridges of the former times were where the immense cañons of the rivers flowing down the western flank of the Sierra now are." In no instance, so far as I know, are any of these ancient deposits found overlying a formation belonging to an age more recent than the old red sandstone era.

As to the origin of these ancient deposits, the old rivers which formed the auriferous beds upon which the towns of La Porte, Howland Flat, Gibsonville, and other mining camps are situated, seem to have emanated from Pilot Peak and its immediate vicinity, and to have run in a southwesterly direction. Yet Pilot Peak is surrounded by a chain of valleys on the west, north, and northeast, some thousands of feet below the level of the old channels. It is held by many, that these old river beds "consist of materials, which have been brought down from the mountain heights and deposited in pre-existing valleys." But here, firstly, there are no mountain heights from which the rock material could have been derived; and secondly, here are beds of gravel, miles in length, and thousands of feet in breadth, and hundreds of feet in depth, and although they were deposited by the action of ancient streams, many of them are composed entirely of quartz gravel and boulders.

Again, the auriferous deposit at Cherokee, Butte County, six hundred feet in depth in one place, and miles in length and breadth, is composed entirely of quartz gravel, streaked with nearly horizontal lines of red oxide of iron. Free gold exists all through the mass of gravel, from the top to the bottom, and I am informed by Mr. Kendricks, whose acquaintance with this deposit extends over a period of twelve years, that it is the richest top gravel he knows of in the State. The presence of free gold all through the mass, some of it rather coarse, shows that this deposit has never been subjected to the action of a running stream of water, or the gold would have been deposited in strata, or at the bottom. Indeed, this deposit looks as if it might originally have been a mass of molten quartz, which was afterwards granulated by being queched with water.

While many of the ancient auriferous deposits situated along near the summit of the Sierra Nevada, are high above the present river beds, some of the old channels situated along the western base of the Sierra, are below the beds of the present streams. The ancient river bed known as the Bangor Blue Lead, Butte County, runs in a north of northwest direction; while the present water courses run in a southwesterly direction across this old deposit. The old river channel is deep below the beds of

the present streams, showing that the topography of the country has greatly changed, as the site of this deposit must have been at the time of its formation, perhaps, hundreds of feet above its present level. This, together with many other facts, lead me to infer, that the volcanic line, at and near the base of the Sierra, was during the eruptive era of quartz,—while the crust of the earth was thinner,—a range of low hills or mountains, which, during the widening and upbuilding of the Sierra Nevada, was sunk to, and at one period, below its present level, as the overlying marine deposits indicate.

[Concluded in our next.]

THE RESOURCES OF IDAHO.—A correspondent writing from Boise City, Idaho Territory, April 3d, says of that region: In one of my occasional scribbles last year, I expressed the opinion that from indications, it would not be long before the sound of the quartz battery, and the smoke from many furnaces would be seen and heard in this vicinity, and I believe that the time is near at hand.

Last month a ledge was discovered about five miles from this city, which prospects finely. The company have 1,000 feet staked off, and traceable by surface croppings nearly the whole length of their claims. Pieces of the rock taken from the lode have been assayed by Mr. Liebman, assayer, and gave \$92, \$149, and one piece, \$148 to the ton—silver slightly predominating in the latter. The vein at present is not over three feet wide, and for Idaho Territory is a small lode. It is called the Scorpion. It is said that other lodes in the immediate vicinity of Boise City have also been found. Only let them be found and tested, and the superiority of the climate over any other in the Territory will do wonders towards their obtaining capital to work them.

To-day the thermometer is 88° in the shade, and the weather magnificent—and during the winter, although we sometimes have some cold weather, yet, there is neither cold or snow sufficient to arrest work. At Owyhee the snow is now just beginning to melt, and whilst the stages from the east and west are making regular time, it is mud, snow and slush from Owyhee until the Snake River bottom is reached,—in fact except that Boise City and Valley is fully warm in summer, it is as fine and lovely a climate as any that can be found north of 40° north latitude.

TEST FOR EXPLOSIVE OILS.—The following is from the *Journal of Chemistry*: "Take a common quart bowl; fill it one-third full of boiling water; now add cold water, a little at a time, until a thermometer placed in it indicates a temperature of 110 deg. Fah. A tablespoonful of the oil to be tested may be turned into the water, and stirred about with the thermometer. It will float on top, and it may be touched with a lighted match or a bit of paper. If it takes fire, the oil is dangerous; and the seller can be prosecuted under the United States law. It must not be used in the family. In this experiment, so simple that all can make it, an accurate thermometer should be used. The common thermometer in a japanned iron case, is usually sufficiently accurate. To test the thermometer, bring the water into the condition of active boiling; warm the thermometer gradually in the steam, and then plunge it into the water. If it indicates a fixed temperature of 212 deg., the instrument is a good one."

PORCELAIN GLAZING.—M. Richard, ceramic manufacturer at St. Christophe, near Milan, recently communicated to the Society of Encouragement, Paris, his process for varnishing pottery. The following are the ingredients: Carbonate of soda, 1-000; boracic acid, 0-800; kaolin, 0-125; carbonate of lime, 0-250; sulphate of lime, 0-250; crystallized feldspar, 0-750; quartz, 0-280; fluato of lime, 0-150. Manganese is added to obtain the desired tint. The whole grit is ground fine, and then mixed with 110 parts of kaolin and 52 parts of feldspar for every 460 parts of the above frit. It is applied as usual in glazing, but, as the specific gravity is less than the leaden coating, the same weight of the new glaze will cover a greater quantity of pieces.

[Written for the Mining and Scientific Press.]
Mining near Boise City, I. T.

EDITORS MINING AND SCIENTIFIC PRESS. The financial agent of the Lucy Phillips G. & S. M. Co. (Mr. Wiles) is here, en route for Yuba, Alturas County. This is a company formed in England, with a capital of £120,000. They have purchased machinery, and probably by this time it is on its way from Columbia River. Workmen have gone up to erect the necessary buildings, and the machinery is bound by contract to be delivered at Yuba, by middle of June. I see by the London *Mining Journal*, that the leading men of the company are gentlemen of high standing and respectability in London, and are men of means, so that in all probability there is at last a respectable and stable corporation ready to operate in that hitherto "scindle-cursed" region of Alturas County. I will keep you posted on the doings of quartz men and mines of that region. Mr. Matthew Graham deserves much credit for the tact and energy he has displayed in being the first to start an English company in this wild region.

The winter at Yuba has been very mild, and little or no snow of any moment has fallen there, while Rocky Bar has had several feet; but it is fast disappearing, and placer miners are getting to work.

The Phillips Co. also talk of buying the old Idaho G. & S. M. Co.'s mill, erected under the superintendency of Dr. Farnham; and it is confidently expected, that this summer will give you some news from Yuba in the shape of gold bars and silver bricks. I also learn that the Greenback Co. are preparing for work.

It is hoped that the Alturas Mining Co., of which Col. John O'Neil was Superintendent last year, will now go ahead, as they have plenty of machinery, about 25 miles from Yuba, and a good ledge at Yuba—the "Hard Times." They will do well to listen to such practical men as Col. O'Neil, instead of the inefficient party, lately sent out. It is just such men that have set Alturas County so far in the background; but the day is dawning, when Alturas will take her place high on the list of gold and silver producing counties. You may expect during this year, great developments in all the quartz districts of southern Idaho.

The "Scorpion" lode, of which I made mention in my former letters, improves as work progresses, and will doubtless, under the able management of its present energetic owners, develop into a first-class lode. May many more like it be found so close as that is (five miles) to Boise City.

H. W. O. M.
Boise City, April 24, 1868.

VALUABLE MINE.—The Bee Hive Company's mine, located some 25 miles easterly from Oroville, Yuba County, appears, from all accounts, to be one of much promise; but it is now idle for the lack of capital to work it. The locators have pretty thoroughly prospected it, by a tunnel some 250 feet long, connecting with an incline 105 feet from the surface, and other drifts and workings. The rock taken out has been crushed in a small, illy-constructed, 4-stamp mill. The chief part of the rock worked, has been taken from a chimney, leading from the tunnel to the surface, and has paid \$17 to the ton, independent of the sulphurets, which are very abundant, and, according to a certificate of assay, by Knight & Co., of Marysville, also very rich. The certificate of assay, which is before us, reports the sulphates as yielding \$639.94 in gold, and \$31 in silver per ton. About \$8,000 in all have been realized. Such a mine ought to pay well to a company having the means to properly work it. The present proprietors are looking for such parties, with whom they are willing to negotiate for the entire, or a partial interest. Hoisting works will be necessary to a further prosecution of the work. The time is rapidly coming when the chief value of most of our great mines will be found in their sulphurets.

Mechanical.

THE MANUFACTURE AND WEAR OF RAILS. Mr. C. P. Sandberg recently read an interesting paper upon this subject before the Institution of Civil Engineers, giving the results of a series of elaborate experiments. Among his conclusions were the following: That no rule could be laid down for the manufacture of rails that would apply to every district; but that in the case of Welsh iron, it had been proved that the best method was that now most commonly practised—rolling the iron into hars, piling these, and repeated rolling to the finished rail, without hammering. He assumed that the prejudicial result from hammering was owing to the large amount of sulphur in the Welsh iron. Where the iron contained more phosphorus and less sulphur, as, for instance, in the Cleveland, Belgian and French iron districts, hammering has proved beneficial, and rails had been made direct from puddled bars, without the intermediate process of piling; this being, in fact, the method generally adopted in those places, and being found to answer best.

With regard to the relative economy of iron and steel, Mr. Sandberg considered that it was the amount of traffic which must decide which material was the most economical to use for the maintenance of the permanent way. For all railways where ordinary iron rails were worn out in five years, or in a shorter time, solid steel rails (at twice the price of iron) were the most economical. Where ordinary iron rails lasted over five and up to ten years, steel-top rails would be the cheapest; iron rails in these cases being clearly proved to be the most expensive, although the cheapest where they lasted from fifteen to twenty years.

THE LATHE.—The *American Artisan*, in an article upon the abuse of tools, says of the lathe: "In many machine shops, the lathe is not only the indispensable tool, but often the only tool of any importance that is employed, and sometimes thought to be the only one needed for the majority of operations in some kinds of machine building. This tool, which is designed especially for the production of cylinders and for screw-cutting, is thus enervated and degraded into a sort of pack-horse, being made to perform the work of a drilling machine, milling machine and gear-cutter; and often has to subserve the purposes of a planer and frame for polishing wheels. We have seen superior lathes, which were nicely and carefully fitted when manufactured, but after a few months' wear and tear in shops where they were thus rudely treated, had not the first approach to accuracy, and as a result, their makers were often condemned as producing work that could not be depended upon."

DELICATE IRON CASTINGS.—In the Berlin iron castings, the minutest details are sharply defined, and the entire surface has a bronze-like smoothness. M. Schott, the manager of Count Stolberg's works in Brunswick, has carried the manufacture to the highest perfection. His sand is made by mixing burned clay with a pulverized sandstone, having a maximum porosity. The most important part of the process, however, is the preparation of the metal. M. Schott made a series of experiments to determine the melting point of different kinds of pig iron; and by mixing several in proper proportions, he has been enabled to vary the melting point at will. It will surprise even practical ironfounders to learn that his experiments proved that the melting point of different samples of charcoal iron made at his own blast furnaces varied more than 800° F. Charcoal iron generally melts at 700° higher temperature than coke iron. The contraction on cooling is greatest in the charcoal iron, and, in most cases, it has the greatest density when solid. In examining various specimens of casting, M. Schott brought to his aid the microscope, and was thus enabled to detect certain differences which chemical analysis had failed to explain.—*Scotsman*.

NITRATES FOR STEEL MAKING.—The *London Mining Journal*, for March 28th, gives an account of Mr. Hargreaves' process for making steel,—and reviews a paper recently read before the Cleveland Society of Engineers,—in the course of which it says:

The material which Mr. Hargreaves finds best suited for effecting the conversion of the iron into steel is nitrate of soda. It had been used before for the manufacture of steel and iron, by placing it at the bottom of the converting vessel, but without taking precaution to hold it there till decomposed, or to regulate the violence of its action. One of these proposals was secured by patent more than ten years before the date of the Bessemer patents, but in the somewhat impracticable shape of pushing the salt to the bottom of the fused metal in packets of brown paper. Another mode was to force it through a tube to the bottom of the fused iron. To convert cast-iron into steel, it is necessary that the quantity of carbon which is in excess of that required to form steel should be extracted; and also the whole of the silicium, sulphur, and phosphorus. The first element removed is the silicium, which is effected by the oxygen of the nitrate of soda, converting it into silicic acid, while the soda forms a lase to combine with the silicic acid formed. The carbon is next removed in the form of carbonic acid, or carbonic oxide gases, and the sulphur and phosphorus are in a great part removed as sodic compounds. In working out his invention, it was necessary to have some means of regulating the rapidity of the action of the salt. This he effected by mixing with some inert compound, and he found that oxides of iron and manganese, while thus acting as regulators of the action of the salt, also by affording oxygen, enabled him to effect a considerable saving in the quantity of salt used, and also increase the quantity of steel produced.

SAFETY VALVES.—At the meeting of the Polytechnic Association of the American Institute, March 26th, Mr. Emery gave the result of some experiments made at the Novelty Works, in New York City, respecting the area of safety-valves, and remarked that the area of safety-valve openings in square inches per square foot heating surface in boiler— $1-13.5 (n+3)$, in which p equals pressure in pounds above the atmosphere.

This formula gives results corresponding with those obtained by experiment for difference of pressure ranging from one pound to one hundred pounds per square inch. It is not strictly correct when nearly to zero. The formula gives the area required to maintain the steam at a given pressure with ores burning freely; but it should be remembered that the safety-valve does not open sufficiently to give its full area without considerable increase of pressure. The area of the valve should therefore be much larger than that of the opening calculated as shown. This formula also gives the proper size of the steam pipes connecting several boilers set in a "nest." The difference in pressure in the several boilers should never exceed one-fourth of a pound at the greatest. Letting $p = \frac{1}{4}$ in the above, will give the smallest area of steam connecting-pipe consistent with safety, and it would be better, when possible, to make them fifty per cent. larger than this. The limited size of steam connection has been the cause of many so-called "mysterious" explosions in a nest of boilers having but one check-valve in the common feed-pipe.—*American Artisan*.

BLAST FURNACES.—Mr. John Heaton, of Langley Mill, Derby, has obtained a patent relating to blast-furnaces. The object of this improvement is to avoid the necessity for the use of blowing machinery to obtain the required blast, by connecting the upper part of the furnace with a chimney of considerable height, adapted to the draft required, openings being provided for the introduction of the charges. The tuyeres receive their supply from the external air, in place of from blowers.—*London Mining Journal*, March 28th.

POWERFUL PRINTING PRESSES.—"M. Marionni has put up in the new printing office of the *Petit Journal* a marvelous machine of his invention, which prints 600 copies a minute. Four of these machines turn out 144,000 copies an hour; the whole impression being 446,000 daily."—*Paris Correspondence*.

Scientific Miscellany.

Influence of Light on Infusoria.

Prof. F. Cohn has made experiments with the mouthless genera of infusoria, which are provided with cilia, and those genera of microscopical plants which are possessed of an independent power of migration. He finds they all move in a definite direction, and that the immediate cause of movement is light. In colorless organisms light has no influence, and they appear to move in every possible direction. Experiments with *Euglena* gave the following results: If a drop of water equally filled with these green organisms be placed upon a glass slide, it will be seen, before many minutes, that they will betake themselves to that portion of the drop which is turned toward the window, or even toward that part of the sky which is most lightened. He found that it was not the intensity, but the direction of the rays of light which governed the movements of these organisms. The following are Prof. Cohn's conclusions:

1. The direction of the movements of green organisms is determined by the direction of the rays of light which fall upon them. They are attracted rectilinearly by the source of light. Apparent exceptions to this rule are brought about simply by the form of the drop or mass of water containing them.

2. They exhibit a polar relation to light; the cilia and that part containing no chlorophyll are turned toward the light, and the green portion away from it.

3. All movements are accompanied by a rotation of their bodies around a longitudinal axis passing through the head and tail. While in the darkness they can turn from right to left or left to right, but under light they have a definite direction which is contrary, in *Euglena*, to the hands of a watch and the same as the rotation of the earth.

4. Experiments with colored glass show that only the more refrangible or actinic rays induce this direction. The organisms are more strongly attracted by the blue rays, while the red are the same as total darkness. If one-half of the field is lighted by blue and the other by red, they will go to the blue side, even if it be turned away from the window-edge. There are some exceptional forms which turn away from the source of light by a backward motion, and afterward return to it.

5. It appears probable that all these phenomena, so far as direction of movement is concerned, depend upon the chemical activity of these bodies. We can, in fact, imitate many of these movements by purely chemical processes, with the help of what may be called artificial *Euglena*, viz: a fusiform fragment of chalk, having one-half covered with a resinous cement, which, when placed in diluted sulphuric acid, develops chemical action in its uncovered half, and by the backward impulse thus generated in the direction of the uncovered end, the chalk is made to rotate.

INTERESTING ELECTRICAL EXPERIMENTS. M. Rondel of Brive, has recently been making some experiments which are described by the *Chemical News*: "If, while the current passes through the primary wire of a coil, one of the extremities of the secondary wire is brought near one of the extremities of the iron core, sparks can be drawn of remarkable intensity and brilliancy; if, at the same time, the other end of the secondary wire is put in communication with one of the poles of the pile, a great increase takes place in the brilliancy of the spark. Then, on touching with the hand the iron core, and placing the free end of the wire in contact with the skin, a smart stinging sensation is felt. The sparks were produced with detonations. A single Bunseu element of small size was sufficient to produce these phenomena. When two recipients are charged with mercury and water, and fragments of iodine added, no effect is perceived; but if a small piece of zinc is allowed to fall into the mercury, the fragments of iodine are instantly set in motion and are rapidly dissolved. This solution, poured off clear, serves for many uses. M. Rondel has employed it, concentrated, for the supplying of a pile mounted in a closed flask, also for the preparation of a fine red iodide of mercury."

LIGHT FROM ATMOSPHERIC OXIDATION.

H. Baumhauser says that oxidation is so rapid upon a perfectly clean surface of potassium or sodium, that light is thereby evolved.

SENSITIVE FLAMES.—To obtain a flame which shows, to the best advantage, the curious phenomena upon which Prof. Tyndall has recently made and published such interesting experiments, all that is necessary is to burn the gas from a jet under considerable pressure; this may be done by forcing it from a bag. A flame may in this way be obtained, which rises in a slender column two feet high, and is exquisitely sensitive. "At the sound of a chirrup the flame sinks down more than a foot. To this sound it is especially sensitive; the chirping of a sparrow, or a cricket, would affect the flame fifty feet away. To the lower musical notes the flame is utterly dead, but to the higher it is keenly alive. It makes no response to the letters O, U, nor to the labials, but it energetically responds to the sibilants. Like a living being, the flame trembles and cowers down at a hiss; it crouches at the noise made by jingling a bunch of keys; it shivers at the least shaking of a few tin-tacks, although the noise is so faint as scarcely to be heard; it dances in tune to the waltz played by a musical box, and it even beats time to the ticking of a watch." These phenomena have not yet been fully explained. That there is a relation between the rapidity of vibration of the column of gas as it passes the orifice of the burner,—and that of the vibration of the air caused by the sound,—is probable, and we have believed, been partially shown. A guitar string, as we know, answers to the note to which it is tuned, when sounded even in a low tone, in any part of a large room.

CHEAP OXYGEN AND CHLORINE.—M. Dumas says that by Mallett's process, 100 kilogrammes of protochloride of copper can be made to yield daily from 15 to 18 cubic meters of pure oxygen, at a cost of from 50 to 60 centimes. Quite as successful results were obtained in the separation of chlorine from hydrochloric acid. The same amount of protochloride furnished chlorine for the daily production of 300 kilogrammes of chloride of lime.

BARYTA WHITE.—Kuhlmann & Wagner's process for preparing this is as follows: The native sulphate is first reduced to sulphide of barium by calcining in iron crucibles, four parts, ground to a fine powder, with one part of powdered coal, and from five to eight per cent. of coal tar. After several hours, the mixture is removed from the crucibles and recalcined in a closed furnace to prevent oxidation. When cold, it is treated with hydrochloric acid, the liquid being kept alkaline to prevent the admission of other metals, and from the chloride of barium thus obtained, by means of sulphuric acid, is precipitated the pigment. This is a much more permanent white than can be prepared directly from barytes.

CHEMISTS' CEMENT.—Dr. Tollens has produced a modification of Sorel's cement,—which we have already mentioned,—that is not, like that in some cases, objectionable from its very quick "setting." He mixes equal weights of commercial zinc white and very fine sand, and makes the mixture into a paste with a solution of chloride of zinc having the density of 1.26. The mixture sets rapidly, but allows plenty of time for its application. As it resists the action of most agents, it will be very useful in the chemist's laboratory.—*Am. Artisan*.

DEATH OF AN EXPLORER.—Intelligence has lately been received in England of the death of Mr. Charles J. Anderson, the South African explorer. Mr. Anderson was the author of "Lake Ngami, or Discoveries in Southwest Africa," and also of "The Okavango River, a Narrative of Travel."

THE SELECT EIGHT.—Sir Roderick Murchison has been elected by the Academy of Sciences in Paris Foreign Member, in place of the late Professor Faraday. There are only eight such members, and the honor is regarded by men of science as the highest a man can receive. As a matter of form the decision has to be submitted to the Emperor for his confirmation.

INFUSORIA IN WHOOPING COUGH.

M. Poulet has examined, under the microscope, the vapor expired by several children suffering with this disease, and found it to contain, in all cases, a certain species of infusoria,—identical with that described by Muller as *Monas punctum*.

New Patents and Inventions.

Under this heading we shall mention, from week to week as occasion may demand New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

76,160.—IMPROVEMENT IN SHINGLE MACHINES.—John F. Chambers, Calistoga, Cal.

I claim the combination and arrangement of the dog *b*, movable table *v*, eccentric shaft *a*, and levers *W*, for clamping and holding the shingle while it is being shaved; and in combination with the parts above claimed, I claim the sliding frame *h* and knife *i*, for shaving the shingle.

I also claim the combination and arrangement of the flat shaft *c*, pinion *g*, wheel *f*, ratchet *e*, and pawl *d*, to alternately raise and lower the end of the table *U*, to shave the shingles tapering.

The object of this invention is to provide an improved machine for riving and shaving shingles, which consists of a river, upon which the bolts of a proper length are clamped, and then split out. From this they are taken and placed on a roughened table, and a roller is made to pass over them, so as to hold them firmly down, one end of the table rising at the same time, so that the end of the shingle is firmly clamped and held by a dog, while the knife, passing directly behind the roller, shaves one side. One edge is jointed at the same time, after which the roller moves back, the table is depressed, and the shingle freed, when it may be turned over, and the other edge jointed. By a peculiar mechanism, one end of the table rises at each forward motion of the knife, so as to clamp the shingle, while the other end rises, at every alternate motion, thus giving the shingle the requisite taper. The machine may be worked by hand, horse, or steam power; but is intended to be portable and to be worked by horse power.

76,300.—IMPROVEMENT IN COMBINATION LOCK FOR DOOR.—Wm. C. Bussey, San Francisco, Cal.

I claim the bars *D*, *D*, and the lugs *a*, *a*, for retaining the bolt, together with the plate *F*, bar *d*, and spring *G*, in combination with the grooved annular tumblers, the whole constructed and operating substantially as and for the purpose described.

This invention relates to an improvement upon a lock for which letters patent were granted to Mr. Bussey, Sept. 5th, 1865, and consists in a novel method of securing the bolts when drawn, either forward or back. In the former patent the spindle and arbors were all put through from the inside, and secured by feather and groove to the knobs. This mode of construction carries the objection, that if by blows on the knob, the inner plate of the locks may have been broken, the lock might be so damaged by continual blows as to be disabled and rendered useless. The present invention remedies this defect.

76,325.—IMPROVEMENT IN FRICTION CLUTCH.—James B. Johnson and William H. Birch, San Francisco, Cal.

We claim the axle *A*, with its fast pulley *B*, and enclosing case *C*, with its inclined planes *c*, *c*, together with the rollers *a*, *a*, *a*, the whole constructed and operating substantially as and for the purposes described.

2. We claim the spring *d*, attached to the projection *b*, or its equivalent, when used in the clutch for insuring a prompt action of the rollers *a*, *a*, substantially as described.

The object of this invention is to provide an improved clutch, to be used upon hoisting apparatus, pulleys, ratchet-drills, or in any place where a free motion about the axle is desired in one direction, while it is desirable to have the whole mechanism move together in the other. This apparatus is designed to take the place of the pawl and ratchet, and consists of an axle, having keyed to it a pulley or roller, in a case which encloses it and turns loosely upon the same axle. The inner circumference of this case is formed so that a series of small rollers can be placed between the outside of the tight pulley and the inside of the case, and when the axle is turned in one direction, these rollers move easily between the case

and the pulley, and allow the case and its connections to remain stationary while the axle revolves; but when moved in the other direction, the rollers immediately bind on the pulleys, as the inner face of the case forms inclined planes, making a narrowing space in that direction, which effectually checks and holds the two together, so that they move as one pulley. By this apparatus, as short a motion as may be desirable can be readily made, as in the use of a ratchet-drill, while the combined motion in the opposite direction is instantly secured, without losing the length of a tooth, as is the case where the pawl and pinion are employed. Moreover this apparatus can be constructed much cheaper and more durable than any other for accomplishing the same purpose.

76,371.—IMPROVEMENT IN POTATO DIGGERS.—Benjamin P. Wright, San Francisco, Cal.

I claim a potato digger, having the spade *D*, *E*, the inclined carrying or elevating belt *G*, and the belts, *J*, *J*, together with the cleaning sieve *K*, the whole constructed and operating substantially as and for the purposes herein described.

The object of this invention is to provide a potato-digger which shall take the potatoes from the ground, free from dirt, and finally deposit them in any receptacle prepared for them. This is accomplished by constructing a frame mounted on wheels, and carrying in front a movable spade or digger, which takes the potatoes from the ground, and deposits them upon a carrying belt, by which they are taken to the rear of the machine, and dropped upon a shaking sieve or perforated table, where they are freed from the dirt, which falls through the sieve upon the ground, or they may pass more directly into any desired receptacle.

76,413.—PROCESS FOR EXTRACTING GOLD FROM ITS ORES.—Rudolph D'Heurcuse, San Francisco, Cal.

I claim the process herein described for extracting gold, by passing gold-bearing substances reduced to a fine powder, without previous alloy, through melted zinc, by introducing said substances below the surface of the melted zinc, as set forth.

76,447.—GANG PLOW.—W. F. Higgins and Jerome Perry, Watsonville, Cal.

We claim the combination of the inclined beams, *I* and *K*, braces or supporting bars *J* and *C*, adjustable pivoted bar *M*, and pivoted bars *H*, with each other, with the plow frame *F*, sulky or wagon-frame *A*, and axle *B*, substantially as herein shown and described, and for the purpose set forth.

2. The combination of the lever *P*, connecting-bar *O*, and arm *N*, with each other, with the axle *B*, and framework of the sulky or wagon, substantially as herein shown and described, and for the purposes set forth.

76,578.—CULTIVATOR AND HARROW.—Simon Conrad, Petaluma, Cal.

I claim the connecting devices, by which I attach at pleasure, the cultivator or the harrow alternately to the truck or carriage, all as shown and described.

2. In combination with the above, the construction of the spindles on which the wheels of the truck are placed, so that they may be so placed on the axle as to increase or decrease the distance between the wheels, as may be desired, all as and for the purposes shown and described.

NEW INCORPORATIONS.—Articles of incorporation have been recently filed in the County Clerk's office in this city as follows:

SENATOR G. & S. M. Co.—May 8th. Capital stock, \$600,000; 6,000 shares, \$100 each. Trustees: N. Page, Daniel Murphy, John Hamill, John M. Kewen, and William Corcoran.

MAXWELL G. & S. M. Co.—May 8th. Capital stock, \$520,000; 2,100 shares \$200 each. Trustees: E. D. Keys, D. D. Colton, George Wallace, D. J. Williamson, and John Steinberger.

SPRING VALLEY HOMESTEAD ASSOCIATION. May 9th. Trustees: A. T. Fletcher, H. F. Williams, H. O. Howard, L. B. Dell, and E. W. Browne.

MARTIN'S STEAM ENGINE.—One of these engines, the principle and construction of which was fully described in the PRESS a few months since, has just been built at the Fulton Foundry, where it may be seen in operation. It is quite a mechanical curiosity and attracts much attention.

THE Mercantile Library Association are getting ready to move into their new building on Post street.

Avery's Patent Tube Well.

The London *Illustrated News*, for March 21st, gives a spirited illustration and description of an experiment made with this new method of sinking for water, at a point near the Thames Ditton Station of the London and Southwestern Railway. This is an American invention, known here as Avery's, but in England as Norton's tube well—so named from the English patentee. Tubes of various sizes were brought into requisition during the experiments alluded to. The first was made with an inch and a quarter tube, which was driven down sixteen feet, the pump affixed, and water raised at the rate of from ten to twelve gallons per minute, in just nineteen minutes from commencement of operations. The next tried was a two and a half inch tube, which was driven into the earth the same distance, and water obtained by pumping in twenty minutes. A third tube, four inches in diameter, was next tried, at an expense, however, of a longer time. These tubes were driven into the ground by means of a hammer, raised by pulleys, working upon a center column, very much as the ordinary pile-driver works in a frame.

After the tube is driven down, it is but a moment's work to screw the pump to the top of the tube, when, if the bottom of the tube has reached to the depth of from five to eight feet below the water level, water is immediately brought to the surface, mixed with sand at first, but running pure and clear after a few strokes of the pump. The bottom of the tube is armed with a long tapering steel or iron plug, which is forced into the ground in the same manner as a pile. Immediately above this plug, where the tube properly commences, the walls of the same are pierced with a great number of holes, through which the water is forced by the suction of the pump, or by its own gravity displacing the air in the tube. Whatever sand can pass through the holes is raised to the surface by the pumps; and as soon as all the loose sand is thus disposed of, the water runs perfectly clear.

The cost of putting down such a tube well is small in comparison with that required for sinking or boring ordinary wells. This invention, which has already been several times alluded to in these columns, was found of great service to the late British war expedition to Abyssinia, which fact rendered it very popular in England, where it is being very generally introduced. The Emperor Napoleon, after experimenting with it in his own private garden, purchased the right for Algeria.

It was also used, when occasion required, by our own army in the late war of rebellion. It might be quite generally and advantageously used in this city, especially where water can be reached without encountering rock. We give subjoined an illustration, which will give a very intelligent idea of the manner in which these wells are made to operate. Mr. S. P. Roberts, 318 Pine street, is agent for the patentee for this coast.

Order Bussey's Combination Burglar and Powder-Proof Keyless Lock!

REASONS WHY.

- 1st. It is the best Combination Lock known.
- 2d. It is impossible to pick it.
- 3d. It can be subjected to over half a million changes, and when run by a burglar, he is no nearer entrance than when he began.
- 4th. It has no key to lose.
- 5th. The more it is used the better it is liked.
- 6th. It has no signs, letters or figures, on its face.
- 7th. It is the simplest to understand.
- 8th. It is impossible to open it without knowing the set.
- 9th. It is least possible to get out of repair, as any one will be convinced on examination.
- 10th. It is the strongest Lock.
- 11th. No possible derangement of combination can be made.
- 12th. Amador County has adopted this Lock for its safes.
13. It received a special premium at State Fair.

Opinions of the Press and others in regard to Bussey's Combination Lock.

The Bank of British Columbia ordered the first one of these locks introduced in this city, and the following recommendation has been received by the inventor:

BANK OF BRITISH COLUMBIA,
San Francisco, May 24, 1866.

Recently two of Wm. C. Bussey's new Patent Combination Burglar-Proof Locks were placed upon the vault doors of the Bank of British Columbia. They are found to operate with all the efficiency claimed by the inventor and in every way meet our fullest approval. They were ordered upon mature deliberation, after strict investigation of their merits, in comparison with some of the most noted and popular old styles of combination locks.

We deem the lock entirely burglar-proof. It is strong in construction, without intricate or delicate parts, with simple and easy movement. We find no difficulty in either opening or closing it, nor in changing its combinations, which may be made almost innumerable. As a California invention of extraordinary merit, we take pleasure in recommending it to public attention, believing it to possess all the advantages which are claimed for it.

WM. H. TILLINGHAST, Sub Manager.
We do hereby certify, that Wm. C. Bussey's Combination Lock is the best Safe Lock in existence, and impossible to be picked. We have applied several to Vaults and Safes, to entire satisfaction of parties interested.

KITTEBICK & LEAVITT,
Plouer Iron Works, cor Fremont and Market sts.

SAN FRANCISCO, May 6, 1867.
I do hereby certify, that Mr. Wm. C. Bussey's Combination Lock is the simplest and strongest in construction, and the least possible to get out of repair; and for Safes and Vaults in every other respect as good as any other improved combination lock which I am acquainted with.
JOHN R. SIMS,
Vault Manufacturer, Oregon street.

JACKSON, April 27, 1867.
I, the undersigned, Sheriff of Amador County, do hereby certify that I am using one of Wm. C. Bussey's Keyless Combination Locks on my safe, which is made to draw four bolts with facility. I believe the lock to be the best lock ever invented, for the following reasons:

- 1st.—Because it is impossible for either burglar or expert to pick it.
- 2d.—The lock being constructed without a key-hole, it cannot be blown to pieces by powder.
- 3d.—There is no possibility of deranging the combination by breaking off, or attempting to drive the knobs into the safe. And it is in fact the nearest approach to perfection yet arrived at in the art of Lock making.

R. COBNER.
Attested by J. C. SHIPMAN, County Clerk.

JACKSON, April 27, 1867.
The undersigned, Treasurer of Amador County, do hereby certify, that I am using one of Wm. C. Bussey's Keyless Combination Locks. It is fastened to the outside door of the Treasurer's Safe. I have no fear of any bystander gaining a knowledge of the set of the combination, when locking or unlocking the same. If I desire to have access to the safe very few minutes, I can so adjust the combination as to open this lock in two seconds of time. I am exceedingly well pleased with the same, and I deem this lock to be all that the inventor claims for it.
OTTO WALTHER.
Attested by J. C. SHIPMAN, County Clerk.

CALIFORNIA LOCK AHEAD.—A special premium was awarded Mr. W. C. Bussey, for his superior Combination Powder and Burglar-Proof Safe Lock, at the recent State Fair. We are sure no award was ever more meritoriously bestowed. This Lock was described at length in the PRESS several months since. At that time it was adopted by several banking houses in this city, and we are now assured that the remarkable praise asserted in favor of the Lock at that time, have been confirmed since by its practical use. We feel an interest in this California invention, and wish to see it speedily meet with the success it is ultimately certain to attain. Mr. Bussey, having properly first fairly tested his lock in California, is now desirous of introducing it in the East, and offers to dispose of the right for several States at very reasonable rates.—(Mining and Scientific Press, Sept. 22, 1866.)

They are the only SAFE LOCK ever invented. Every State and County treasury vault, and every bank and business place should have one.—[Amador Ledger.]

This is a lock in which a series of rotating annular tumblers is employed, and it consists in a novel arrangement of such tumblers in connection with one or more arms connected with one or more bolts, whereby an extremely simple and effective lock is obtained, presenting an almost unlimited number of combinations. For which he was awarded a special premium at the State Fair.—[Sacramento Union.]

We, the undersigned, practical Locksmiths, unhesitatingly pronounce Bussey's Improved Combination Burglar Proof Lock to be the most reliable lock constructed.

F. MARK & C. FLEISHER,
No. 14 Post street.

L. MC LAINE, }

Any good blacksmith can put this lock on safe doors. Bored or single old locks removed and this placed in their stead, to work one, two, three or four bolts, as the case may be.—[See page 30 in Pacific Coast Directory.]

A deaf or blind man can open this lock when he knows the set and understands the full manipulation, without any expert detecting the combination.
19-14ny11&13 lam

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

Alpine County.

Markleeville Miner, April 25th: The Rippon Co. is getting a change of rock in the tunnel, and making good headway toward the lode.

The L. X. L. Co. is still taking out ore, and has a large quantity at the mine which only waits the opening of the Scandinavian road to be taken to mill.

The Pennsylvania Co. continues to meet with encouraging symptoms of the ledge ahead, in the shape of quartz feeders and other indications.

The rock in the Alpine tunnel is still obdurate in its character.

The workmen in the Morning Star mine are 12 ft. into the black ore, in the drift from the 100-foot level, and 5 or 6 ft. with that from the 70-foot station, and not through yet. Piles of \$300 and \$400 ore are lying on the dump.

Amador County.

Jackson Ledger, May 2d: A little more than two years ago, we could only find but one quartz mill with 20 stamps, in the immediate vicinity of Jackson, but now we have five running, in all 120 stamps, the clatter of which can be distinctly heard from the door of the court-house. In addition to this, we have the chlorination works of Messrs. Coney & Bigelow, Ambler's process for concentrating sulphurets, besides two or three arrastras in successful operation.

The owners of the Kennedy mine, near this place, decided last Saturday to erect a 20-stamp steam mill near their shaft. Work will be commenced on it immediately.

Calaveras County.

Chronicle, May 2d: Brackett & Co. have got their new mill fairly to work, pounding gravel from their claim in Chili Ridge. It contains a battery of 5 stamps, propelled by means of a hardy gurdy wheel, with 250 ft. fall for the water. The mill works well in every part.

San Andreas Register, May 2d: Mr. Terwilliger recently showed us some magnificent gold-bearing quartz rock, from Washington district. The quartz is from Billy Smith's claim, and Mr. T. says that the rock now being taken from the Smith mine, is nearly as rich as the specimens which we saw. If so, the quartz must pay a fabulous amount to the ton.

Inyo County.

Los Angeles News, May 5th: A Mr. Piña has written from Owen's River to his friends in this city, advising them to emigrate to that locality immediately, as very rich gold quartz mines have just been discovered there. A party is reported to have cleaned up in one week's run of an arrastra, \$4,000. Information in regard to the existence of the gold was obtained from an Indian, who was given 300 pounds of hard bread.

Kern County.

Havilah Courier, April 25th: The St. John mine at Sageland, is one of the most productive quartz mines in California. Since the mill began to crush quartz, with the exception of about 6 weeks' stoppage for repairs, the mill has been turning out from \$3,000 to \$5,000 per week. On the 6th of the present month, Superintendent Taylor made one shipment of 112 lbs. of bullion, the result of 6 weeks' run.

The Burning Moscow mine, situated in the New El Dorado district, is now being worked with energy by its present owners, Messrs. Hammel & Denker. They are at present running a tunnel from which they take on an average 15 tons of rock per day, which prospects from \$50 to \$70 per ton.

The quartz mining interests of Kern County present a more flattering prospect than they ever have at any time since the discovery of quartz in this region. In addition to the St. John 12-stamp, and Dockweiler & Co's 5-stamp mill at Sageland, there are one or two other quartz mills in process of construction in that rich auriferous district. Rodgers, Keeney & Bridger, are pushing their 10-stamp mill to completion with great energy, and within a very short period of time, they will be crushing rock from their mine, (the Gold Hill Lode). This is probably, one of the most extensive and richest lodes in the county. The Gold Hill Co's mill will probably be in running order by the 1st of May. We also learn that Stearns, Low & Co. are preparing to erect a 10-stamp mill on the Esperanza lode, in Kelsoe Valley. This lode is a recent discovery, but it is said by judges to be immensely rich.

Napa County.

The Napa Register says: We have been shown some very fine specimens of cienna-

bar brought from the Star Co's claim at Pine Flat, near the Sonoma County line, by R. T. Montgomery, which compare favorably with the best we have ever seen. Prospectors have been at work for several weeks, and recent developments leave little room to doubt that a well defined ledge of ore has been struck.

Nevada County.

Transcript, April 29th: The company owning the Wagoner ledge are now putting up a small engine for the purpose of running an incline from the level of their tunnel, to open their ledge at a greater depth.

A large amount of hydraulic mining will be done on Deer Creek, near the Cascades, during the coming summer. The heavy snows have delayed operations.

The Nevada Quartz Mining Co. design erecting hoisting works on their ledge, for the purpose of opening a new level this summer. This is what was formerly known as the Soggs' mine. It is stated that a foundation is now being cleared near the mill for the new works.

Gazette, April 26th: The owners of the Fidelity mine are fully satisfied they have found a good paying body of rock. They have canceled their lease with the San Francisco parties, and will take the mine into their own hands.

Thomas Legge informs us that the Salathiel mill on Diamond Creek has been running all winter, but so thoroughly snowed in that communication with the outer world was totally impossible. They employ 20 men, and crush about seven tons of rock per day.

Smith & White have struck a vein of decomposed quartz at the head of Coyote street, that prospects exceedingly well. They have sunk a shaft 21 ft.

O. S. Cressy and C. H. Ayres have purchased of Clancy, Caldwell & Co. the Central and Union gravel claims at Blue Tent. The ground is 1,200 ft. deep and 200 ft. bank, and the price was \$3,500 cash. These gentlemen were old miners at Blue Tent.

Transcript, May 1st: Considerable feeling exists amongst the miners at Mooney's Flat in consequence of the action of a company under the name of the "Blue Gravel Lake Co.," locating, or, as it is characterized, "jumping," the claims on the Mooney Flat side.

May 2d: Neece & West have started up the machinery on the old Cozzens & Garber cement mine, between Red Dog and Yon Bet. They are now engaged in freeing the mine of water. As soon as this is done, they will commence drifting and breasting, for the purpose of taking out cement. This mine was worked for some time, but in consequence of the breaking in of the waters of the cañon and other misfortunes, success was not attained. The parties who have the mine are experienced miners, and as it is located upon the great Blue Lead, they will no doubt make it pay well. The other cement claims in the vicinity are paying well, and the hydraulic companies at Red Dog and Yon Bet are all at work with flattering prospects.

The miners at German Level, commonly called Dutch Flat, are jubilant over the striking of the Blue Lead in one of their claims. A number of companies are at work, and everything seems to indicate a prosperous mining season for that locality.

May 5th: The Sky High claim, near the Cascades on Deer Creek, is being worked by the Chalk Bluff Blue Gravel Co., and the prospects are good for a very large yield. A gentleman who visited the claim last week, informs us that he saw the water turned on for a prospect, and eight ounces were taken out in a half hour's run.

The Chalk Bluff Gravel Co. is doing first rate. They have been prospecting sufficiently to ascertain that they have an extensive range of gravel which will pay well. Adjoining this ground, Dr. Farnham is working with fine prospects. He has sunk a shaft 500 ft. ahead of the tunnel, and found unmistakable evidences of the Blue Lead. He will run the tunnel 200 ft., which will reach to the inside of the rim, and strike the main channel. Developments already made are sufficient to show the course and bearings of the Blue Lead, and to insure the success of the enterprise.

Gazette, May 2d: The main shaft in the Coe mine is down 100 ft. perpendicular, and 54 ft. on the incline, and the ledge at that point is 6½ ft. wide, and showing gold all the way through the rock. Eighteen loads crushed at Larimer's mill, last week, yielded \$508. They intend to keep Larimer's mill running constantly, and for that purpose have commenced hauling from a dump of 50 tons, which they have already taken out. The greatest excitement exists in Grass Valley in regard to the mine. We hear that a disposition to incorporate is be-

ing manifested by the owners of leads in that vicinity.

May 4th: The Miners at Scotch Flat are doing very well, the recent reduction of water rates by the South Yuba Canal Co. having imparted new life to the old diggings. We saw a mass of retorted gold at Mackie's bank, last Saturday, weighing 17 ounces, the result of six day's work by two men with a single pipe.

The machinery of the Merrimac quartz mill, which was located near the Glenbrook Park, having been purchased by McArthur & Co., was moved on Saturday to Cement Hill.

May 1st: From 22 loads of rock from the Golden Gate ledge, east of the Enreka Co's ledge, \$324.50 was realized. The ledge is owned by Howland, Richardson & Co., is three ft. thick, and has been worked for several years, but not to any great extent.

Grass Valley Union, April 30th: The Union Hill mine, after being idle, has again resumed work, and the prospects are flattering indeed. A new shaft has been started down, and after sinking 25 ft., the ledge was struck, from which rock has been taken which is truly magnificent. This rock is now being crushed at Laton's mill, and a partial clean up has been made. Altogether, the rock has paid \$50 per ton, and much of it is saved aside as specimen rock, which is worth, perhaps, \$1,000 per ton. With anything like a selection, the rock from the new shaft will average about \$200 per ton.

Placer County.

Dutch Flat Enquirer, May 1st: Preparations are being made to resume operations on the Dutch Flat shaft. We have no doubt, from representations made to us, that the owners in this company will be rewarded with as good prospects as those already obtained by the Franklin Co. when the shaft shall have been sunk deeper.

The Waukegan Co., who have the highest pressure in the place, had their water chest blown from the main, on Thursday last, to a distance of 100 yards.

Kidder & Co. made another good clean up during the week, and are now engaged building a new telegraph and extending their pipe, in order to obtain the pressure necessary to enable them to work their claims in a still more advantageous manner.

The Dutch Flat Co. made a remarkably fine clean up during the week, but owing to the reticence of those concerned, we are unable to state the amount.

The Rough and Ready claims commenced washing on yesterday. This is an old claim, and with the systematic manner in which operations will be carried on, we may confidently expect a large yield.

The paving of 16 sluice boxes in Mr. Taef's claim was washed out on Thursday last, greatly incommoding operations in that gentleman's claim as well as inconveniencing others below him.

Anhnra Stars and Stripes, April 30th: The editor, in an apparently jolly mood, informs his patrons with feelings of more than usual gratification, that the Blue Lead has been struck in that vicinity. The strata is about 25 ft. in depth and prospects from 12 to 25 cents to the pan.

Sierra County.

Downville Messenger, May 2d: Gus Larien, while working in Slate Castle ravine, last week, turned out a piece of gold worth \$150. He found one some time since that weighed \$148.

Si-kiyau County.

Yreka Union, April 25th: The miners on Hnmburg are still busily engaged in ground sluicing. The spring has been favorable for this work, and the owners of claims availing themselves of the opportunity, are getting a large amount of ground sluiced off. This will enable them to make a good summer's work. It will perhaps be three or four weeks yet before they are generally through sluicing and commence washing up.

Tuolumne County.

Sonora Democrat, May 2d: The editor has been taking a view of the various mining localities in the vicinity of Sonora, and gives us the following items:

The bed of Rattlesnake Creek, between Kirkwood's and Oak Flat, is being worked by Lewis Smith & Co., who are making good wages. It has been worked ten or twelve times before, always paying well. It is a sort of natural bedrock flume, and will continue to pay yearly as long as there is any mining done at Big Oak Flat.

We found Oak Flat, in general appearance, much the same as when we left it last fall. The late severe winter made business there, as everywhere else in the country, very dull. But on the opening of the spring, times became somewhat livelier, and the prospects are that in Oak Flat, Deer Flat and the Garrotes, there will be considerable activity in quartz and placer min-

ing this summer. The Golden Rock Ditch, which had been dry during the winter on account of slides, etc., occasioned by the rain storms, is now running a full head of water and supplies all the mining camps along the line, to Boneyard and Pino Blanco.

At Deer Flat, one mile from Big Oak Flat, there is a little placer mining being done.

Mr. Snow has leased his partner's interest in the Cosmopolite mine, and is working the mine on his own account. We visited the mine, went all through its shafts and tunnels, and we were well pleased with the appearance of the vein and the character of the rock which was being taken out and crushed. Mr. Snow was not at the mine when we visited it, and we did not learn how much per ton the rock would average. But, from the rich specimens we saw, not only then, but also two years ago, we think that it would be safe to put the figure at \$30 or \$35 per ton. The vein is large and well defined, varying from 3 to 7 or 8 feet in thickness, is easily worked and very accessibly located.

Mr. Hiskey, Superintendent of the Ophir mill at Frankfort, Nevada, paid our city a visit a few months back, and remained a short while prospecting the different quartz veins in the neighborhood. He has a new mode of saving gold, by which he can make quartz rock that won't pay by the old process, pay handsomely. He agreed with Mr. P. M. Bacon of this city, to take the old Star mine near American Camp, and prospect it till June, and if he finds the lead extensive enough, to lease the same and give bonds to pay Mr. B., 80 per cent. fire assay, of all gold taken out. Some of the rock assays as high as \$5,000. He accordingly took charge of the mill, but, being telegraphed from Frankfort to return immediately and take charge of the Ophir mill which had got out of order and been stopped awaiting his return, he left Mr. Morton in charge to hire men and commence operations. Mr. M. has been busy for the past two months sinking the old shaft down 70 ft., and running tunnels, and has struck rock rich with gold. Thirty tons of rock has been taken out by Mr. Morton from the bottom of the new shaft, and will be crashed this week.

Yuba County.

Marysville Appeal, May 1st: The Rattlesnake Co. in Brown's Valley seem finally determined to do their business on a strict cash basis. They are again out with another assessment, being fully aware that their new mill will be running next week on good, if not altogether on rich quartz. The Jefferson has again a good ledge, 3 ft. thick, at the bottom of their main shaft—a depth of about 700 ft. There is still plenty of water in all the mines, but for the last few days they have been less troubled.

BRITISH COLUMBIA.

The *Alta* of this city gives the following: A letter from Cariboo, dated March 25th, says that the claims below the Baldhead were then nearly all working. The Barker Co. were to commence on their drain the following week. New strikes on Mosquito Gulch and vicinity were reported every day. The claims in Red Gulch had commenced to pay. One company took \$1,000 out of four sets of timbers. The claims on Mosquito were yielding good pay. The Minnehaha divided nearly 10 ounces to the share. The Willow divided 20 ounces to each share. Rich pay has been had on Wilson Gulch, about eight miles from Barkerville, and a little west of Mosquito Gulch. Sixty good men have gone out there. A ball was to be given on the 26th of March, to procure funds to build a part of the bulkhead of the drain near Cameron. A subscription list started for the same purpose, yielded nearly \$1,000. A thaw had set in, and the weather was fine and mild.

COLORADO.

Denver News, April 15th: Mr. L. Seaman has returned from the east, where he has been organizing the Snyder Co. The company owns the Silver, Eagle, Durango and Atlanta lodes, all near Georgetown. It is proposed to put up reduction works this year at a cost of \$100,000.

Charlie Slade came down from Granite district yesterday. He informs us that the two shafts on the Hattie Jane, are 60 and 75 ft. deep. On the Yankee Blade the shaft is 75 ft. deep, and the vein of ore fully 3 ft. wide. Last week a new and very rich discovery was made a few hundred yards east and south of the Yankee Blade lode. It is called the Midas lode, and was found by Mr. Fletcher. The quartz is covered with free gold.

Oro City correspondence of same: The prospects for mining in this country for next season are very flattering for both lode and gulch mining.

By the middle of next month the roads

will be open to Cash Creek and Dayton, and up the Arkansas River as far as the mouth of California Gulch, and then we may look for active preparations for a successful season's operations in gulch mining.

Georgetown Mines: The statement that work had ceased on the Baker mine was a mistake. Work has only been suspended in the upper adit. The shaft and two lower adits are being driven as rapidly as possible. Huopeden, Walters & Co. have become successors to Garrott, Martine & Co., in the reduction works heretofore conducted by the last named firm.

Central City Register, April 16th: Mr. Bixby brought us yesterday a fine sample of copper ore from near the middle St. Vrain. It is mixed sulphuret and carbonate, and will be found to contain about 30 per cent. of copper.

Messrs. Harry & Frazier had assays made at the Territorial assay office yesterday, of average ores from the property on the Gregory, worked by them. The result was \$52.24 in gold, and \$15.79 in silver, or a total of \$71.03 per ton, of 2,000 lbs. The ore contains considerable copper also.

The Ophir mine is turning out some very fine ore, and is being worked with considerable profit.

Mr. Field is about to start up his mill above Black Hawk. He will run on his own ore from the Bobtail lode.

The Ni-wot Co. recently discovered that a large vein of ore had been left standing on one wall of their mine, and commenced taking it down; shortly afterward a scale of 15 ft. more caved in from the same side, revealing another large and valuable seam of ore, which the mill has been set to work crushing. No granite walls have yet been found.

The Baker mill in Chase Gulch is running night and day, not stopping from one month's end to another. Mr. Sabiu has it so arranged that when he desires to clean up he is not compelled to stop the engine, but hooks up one stamp after another till all there are in a single battery are suspended; when the battery is cleaned up they are again set in motion. He is preparing to put up a single immense stamp, with five ft. fall, to be used as a rock breaker. It is also proposed to put up 20 more stamps this season. The mill is doing a good business on the Union Co's ore.

The Barrett Brothers are erecting a stamp mill on the Winnebago, to crush all second quality rock. They are now blasting out a foundation in the solid rock, and will have stone enough on the spot to build the foundation. They are entirely dependent on the mine for water. The main shaft on their mine is being thoroughly retimbered and boxed, so as to make it one of the safest in the mountains.

Herald, April 15th: The California works shipped two bars of silver to-day, one of which contained 201.80 ozs., the other 346.85 ozs. The smaller one is worth \$405, and the larger one \$237.

Quite a large party of miners are making good wages at the mouth of Chicago Creek.

Mr. Peregrine's claim on the Running lode is opening out into a very fine body of iron. He has reached a depth of 65 ft., and has commenced two levels, and will continue to sink the shaft.

Moore & Myers are running on one section of the Wilson mill, Mountain City, on ore from the Bates lode, for Mr. H. P. Cowenhoven. They have not cleaned up the batteries since commencing the run, but expect that it will yield satisfactory results.

The Ophir Co. shipped this week a report worth \$1,900.

Col. Tannatt has leased the Empire mill for six months, and is running it on ore from the Bates lode. We learn that he has a large crevice of pay material in the west end of the claim.

The Black Hawk Co. are running the Consolidated Gregory mine pump. This company expect soon to have their new pump, which they are putting into No. 2, Gregory shaft, in order, for draining their mine.

We saw yesterday at George T. Clark & Co's, 164 ozs. of small retorts, the results of various runs during the past week.

IDAHO.

World, April 18th: Letter from Willow Creek district: There is no water, and despite the assurances of the ditch owners, it is not believed that anything like a sufficient quantity will be afforded this year.

The miners were to hold a meeting, April 12th, to consider the propriety of laying over their claims until next season.

April 25th: Last week a clean-up was made at the Elkhorn mill, beyond Pioneer City, of the crushing of a lot of unassorted rock and debris cast aside last fall, and, to the astonishment of the Superintendent, the stuff gave the handsome product of

138 ozs. The mill has been at work upon good ore since, night and day, and the next clean-up will be likely to yield richly.

By word from Deadwood Camp during the week, we learn that there is about 2½ ft. of snow still in the Basin, and consequently mining had not commenced. The camp is filling up with miners and others, and it will be a lively place when the season for work begins.

Mining has pretty generally been commenced about Pioneer, and with good success so far as known.

Owyhee Aralanche, April 25th: The editor has been visiting some of the mines near Silver City. He says: The vein matter of the Poorman is of a nature very peculiar, so soft that it is easily taken out with picks without the aid of blasting; consequently powder smoke and its attendant inconveniences are entirely avoided. It is a wonderful mine, and is at present yielding ore fabulously rich in both gold and silver. In one of the stopes overhead we broke off a piece, from which we obtained two specimens about the size of hen's eggs of almost pure silver, and worth several dollars. A huge pile of ore was on the dump, from which a snug fortune could be made in a short time by merely panning out. Mr. Walbridge, the superintendent, is putting the mine in such a shape that it can be worked to better advantage than ever before. A splendid shaft is being sunk about 300 ft. north of the present hoisting works.

The skeptical should visit the Golden Chariot mine, and feast their eyes on several tons of "specimens" that can there be seen. Scarcely any of the quartz but in which gold can be plainly seen with the naked eye, and to tell of the exceeding richness of some of it would sound like fable. Work is going on night and day. Since the condition of the roads has rendered hauling impossible, the ore-house has been filled, and large quantities piled up on the outside, estimated in all at over 400 tons. The road will soon be in proper shape for hauling to the Sinker mill, which will then commence crushing Golden Chariot ore.

Work is progressing briskly on the Ida Elmore, and the character of the ore very much resembles that of the Poorman. Considering the short time the Ida Elmore has been working, it is one of the best developed mines in the Territory.

The whim at the New York shaft is in operation day and night, hoisting water from the mine.

The Oro Fino Co. are anxiously waiting the arrival of their steam hoisting works. The whim erected temporarily has been repaired and enlarged, and will be kept running until the engine arrives.

Work has been suspended on the Woodstock for a few days, till the surface water runs off.

A tunnel is being run for the purpose of tapping the Minnesota ledge.

Fred. Reuter and others have struck a new ledge on War Eagle, above the Chariot and Elmore. The discovery is called the F. H. Reuter, and is said to be nearly two feet wide on the surface, with croppings rich in gold. An extension has already been located, and a tunnel started thereon.

Stepping into McDonald's assay office, the other day, we saw a pile of Ida Elmore bullion weighing 7,164 ozs., and worth about \$50,000. One of these bricks weighed 1,617 ozs., which is believed to be the largest ever cast in Idaho Territory.

Oro Fino Camp is now lively. The miners are gathering gold while the water runs.

NEVADA.

Esmeralda.

Aurora Union, April 25th: The work of prospecting goes bravely on at Castle Peak, and it will probably be several months before the main lode will be reached. Several new companies will commence operations as soon as the snow melts sufficiently to permit them to work.

On Wednesday last we visited several of the mines on Middle Hill, and were much pleased with what we saw. The Middle Hill claim, which has been lately opened by the DeKay brothers, presents a fine body of ore; and if the vein should continue to improve as it has for the past few feet, they will have the best paying mine in this section. The Groton mine, on the same hill, and about 800 ft. distant from the mine above mentioned, gives promise of proving a remunerative mine. Messrs. Tade, Bodle and Neidy, the owners, have tried a small crushing, and found that the ore was better than they expected. There are quite a number of mines in this immediate vicinity, which are being worked by their owners and paying well.

It is reported that Col. Catherwood has made arrangements for the erection of a mill upon the Palmetto mine immediately.

Although but few miners have been prospecting in Columbus district, several very rich mines have been opened, and all that is needed are mills to crush the ore. We have been informed that Col. Young's mill will shortly be in running order, and that another mill will be erected this spring.

Humboldt.

Virginia Enterprise, April 30th: J. Moore Williams, who left this city in November last on a prospecting trip, has returned, and reports having found a valuable mine in Humboldt county. The lead is situated about 10 miles south of Unionville, within 300 yards of the stage road. There is an abundance of wood and water in the immediate vicinity. Mr. Williams calls his lead the Lady Murray, and located but 400 ft. on it, all of which he owns himself. He says he likes to be able to do as he pleases with a mine he works. As the claim now stands, he has but little trouble in getting the company together, and when together, its councils are marked by a striking unanimity of opinion. We were shown yesterday an assay made by Leopold Kuh, of this city, of ore as it averages throughout the lead, which shows it to contain per ton in gold \$52.96, and in silver, \$15.22; total, \$68.18. The poorest piece of ore he could find in the lead, and which he thought worthless, yielded at the rate of \$23.99 per ton, mostly gold. It is unusual to find gold-bearing veins in the Humboldt country, most of the leads in that region containing argentiferous galena and antimonial ores of silver. As yet Mr. Williams has only sunk upon his ledge to the depth of about 7 ft. In going down it widens rapidly, and will probably prove to be a very large lead, as it was "blind" on the surface, which accounts for its not having been discovered sooner.

Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

Gold Hill News, April 24th: The croppings of the Gould & Curry still yield some very good gold ore, which is being mined to a limited extent near the old surface cave of the mine. For several months past, Mr. Patten has been engaged with a force of hands extracting some very good pay ore from near the surface of the Savage claim, just south of the Gould & Curry line, by means of a small double shaft 180 ft. deep, connecting with the old works of the mine. The hoisting is done by a whim, propelled by a horse. The old Chollar croppings and vicinity still continue to yield goodly quantities of very fair ore, not very rich, but paying, nevertheless. It will be several years before the croppings of the Comstock are worked out.

Enterprise, April 25th: We understand that the Imperial-Empire Co. have cut into the east clay wall, tapping a large quantity of water. This shows that they are not far from their lead.

Silver Bend Reporter, April 25th: Antonio Borges is erecting his mill at the spring, half a mile south of the El Dorado. It will have a battery of five stamps, and be capable of reducing five to six tons of ore per day. It will probably be in running order in ten days or two weeks.

Enterprise, April 30th: It appears that the shaft of the new Imperial-Empire will not be so readily drained as we were led to believe. There was no less than six ft. of water on the track doors of the west drifts yesterday morning, and there is still a strong influx of water from the lead. The shaft will drain not only the Imperial and Empire claims, but also the Alpha, Exchequer, and other mines in the vicinity to the depth of 900 feet.

May 1st: Wells, Fargo & Co. shipped from their Gold Hill office, during the month of April, the sum of \$516,770.81 in bullion.

May 2d: Wells, Fargo & Co. shipped from their office in this city and Gold Hill, during the past week, 7,653 pounds of assayed bullion, valued at \$234,469.35.

The Yellow Jacket, Kentuck & Crown Point Cos., Gold Hill, have combined and are building a large car track about 100 ft. in length, in order to convey to a distance from their mines the waste rock, accumulations which are likely soon to seriously incommode them in their operations about their several shafts and ore dumps.

Gold Hill News, April 30th: There was shipped from Wells, Fargo & Co's Gold Hill office, this morning, 14 bars of bullion, weighing 1,170 pounds, and of the assayed value of \$29,639.80.

The Gould & Curry shaft is being pumped out preparatory to a fresh attack upon the lower levels of that mine. The water had risen in the shaft to a depth of nearly 500 feet.

May 1st: There was shipped from Wells, Fargo & Co's Gold Hill office, this morning, 5 bars of bullion, weighing 367 pounds, and of the assayed value of \$12,453.25.

OREGON.

Dalles Mountaineer, April 18th: Messrs. Bloch, Miller & Co. recently made an assay of a lot of dust from the Libby Creek mines, which proves to be of very fine quality, assaying \$19.01 per ounce.

The trail between Canyon City and Willow Creek is now open, and large numbers of men are passing over it daily to mining camps in that vicinity. The miners are preparing for the spring sluicing, but as yet have done but little work.

Jacksonville Sentinel, April 22d: The Occidental Quartz mill has been running the past week, and as soon as the "clean up" from the run just made is completed, the mill will be set in motion again. The amount of quartz crushed last week, was 94 tons, from the Timber Gulch ledge. The mill is driven by a 30-horse power engine. The crushing and reducing machinery consists of two high mortar batteries, five stamps each, two Rettinger boxes, two Hungerford's improved concentrators, and one seven-foot amalgamating tub, arranged similar to an arrastra.

Umatilla Press, April 18th: A party of 20 men from Grant county, in passing over the mountains to the North Fork of John Day's River, struck some very rich placer diggings, on what is known as Deep Creek. The parties were provided with mining and blacksmithing tools, provisions, etc., and accordingly struck camp and set to work, and are all busily engaged at present in taking out big pay. There is said to be plenty of the same kind of ground.

NEW MEXICO.

A correspondent of the Central City (Col.) **Register,** writing from the Cimarron mines, dated March 23d, says: There has been about 30 miles of gulch claims taken up within a scope of country of five miles square. Outside of this no prospecting has been done. Robinson & Co., known as the Colorado Co., are about the only ones that have their claims thoroughly opened. This company commenced work in July last, and in three months took out \$33,000. I prospect their claim and obtained 30 cents to the pan. There are many other parties that claim they can get as good a prospect, but did not get here in time last season to do anything, on account of the scarcity of water. All possible arrangements for early mining are being prosecuted with vigor, and all are anxiously awaiting the coming of spring. This summer will be sufficient to test the country thoroughly. At present no one knows its richness or extent.

At present there are about 2,000 persons here, and more coming daily.

In another portion of the same paper we find the following: The reports lately received from the Cimarron mines is quite unfavorable, and already people are beginning to come back disgusted. A few are still sanguine that they are to make their fortunes there. The great expectations which induced men to go there, appear likely to fail.

GOLD AND QUARTZ—NEW THEORY.—At a late meeting of the Polytechnic Association of the American Institute, Prof. A. L. Fleury gave a lecture, in which he enunciated a new gold and quartz theory of his own. It is thus reported by the *Artisan*:

The speaker gave, first, his own idea in regard to the formation of quartz from sulphide of silicon, which he conceived as having been formed by the action of sulphur and carbon vapors on heated silicates. Sulphide of silicon, when acted upon by water, being decomposed into a hydrate of silica, and that again with the dissolving sulphureted hydrogen had been thrown up by steam pressure into the cavities of the rocks, where it gelatinized and hardened. He then stated that it was his belief that gold is present in nature in an allotropic, hitherto unknown amorphous condition. This idea was illustrated by comparison with the two allotropic conditions of carbon—lamp-black and plumbeo—the first being amorphous, the latter metallic; lamp-black being light, oxidizable—plumbeo being heavy, and withstanding chemical action, similar to gold in its metallic state. He then explained his own views and ideas in regard to the presence of sulphides of gold in nature, detailing also some experiments that led him to think that gold exists in considerable quantity as a silicate of the oxide of gold, which had hitherto been overlooked.

DEATH OF DERRINGER.—Henry Derringer, the inventor of the celebrated pocket pistol which bears his name, died recently in Philadelphia, aged eighty-one years.

San Francisco:

Saturday Morning, May 9, 1868.

Notices to Correspondents.

SMELTER.—Cryolite must be the novel flux respecting which you inquire. Hitherto it has only been found in available quantities for economical purposes at Evigtok, Greenland, where a vein eighty feet wide has been worked, and has been traced to the extent of 300 feet in length; it dips to the south at an angle of nearly 45°, and runs nearly east and west. There are a considerable number of minerals which accompany it which are highly interesting viz, feldspar, trap, arsenical pyrites, quartz, argentiferous galena (containing 85% per cent. lead, and 45 ozs. silver to the ton of ore,) copper pyrites, blende; sparry iron ore, also, is found to accompany the vein. Gneiss is the inclosing rock of all these minerals. The central upper part of the vein is quite white, but the portions abutting against the gneiss, are much decomposed, having many cavities which contain loose crystals of sparry iron ore. At a depth of ten feet from the surface, the cryolite, although free from foreign matter, assumes a darker color, and at fifteen feet approaches a black one, and becomes more translucent and compact. The deeper the sinkings that have been made, the darker the color has been found, which circumstance has given rise to the opinion that the original appearance of cryolite was black, and will so be found at a moderate depth from the surface.

QUIZZICAL, Mariposa.—We are not able to afford any additional information respecting the real objects intended to be achieved by the Chinese Embassy, lately arrived and now on its way to Washington,—other than what Mr. Burlingame felt himself at liberty to disclose at the banquet, recently given to that Embassy in this city. Mr. Burlingame says it means "progress;" we are afraid, however, a progress of a rather snail-like character. A modification of some of the harsher features as against China, now found in the existing treaty, no doubt forms one of the chief objects. Another may possibly consist in requesting all foreign occupation of Chinese territory, to be given up. If the latter is conceded so as to abandon the government of Chinese waters entirely to the Chinese, as is only right and proper, guarantees will no doubt be required, that the governing powers of China will see that their waters are free from piracy;—in the present state of China, we suspect the Chinese authorities will find that somewhat difficult of accomplishment.

OCCIDENTAL.—The Cohré copper mine, of Cuba, is associated towards the south with a considerable mountain chain, composed of highly calcareous porphyritic rocks, passing into and associated with basalt and a peculiar conglomerate, and on the north, though at some distance, with a range of hard limestone beds. The mineral veins occur in large grained porphyry, near its contact with a coarse conglomerate; both conglomerate and porphyry being extremely calcareous. The vicinity of these mines is remarkable for the frequent occurrence of earthquakes; two months rarely elapsing without a shock of that description being sensibly felt throughout the surrounding district.

PALEOLOGUS.—The remains of the Mnsk Ox, in a fossilized state, have been found in England in the valley of the Thames, among a series of gravel beds, belonging to the Tertiary formation. Professor Owen, comparing the fossil and crania of the recent and fossil varieties, states that the horn-core in the recent, is less vertically deflected, and is bent in a slight degree more vertically outwards and forwards at the tip.

The American Anti-Incrustator.

Various plans have been proposed for the prevention of the formation of scale in steam boilers,—and various recipes published for the preparation of mixtures, which through their chemical reaction, might cause the objectionable sediment to be dissolved as fast as formed. But all these have been found wanting. Not only do different cases require different mixtures, but the expense and trouble of making such mixtures are serious objections to their use. It may well be believed, therefore, that the simple and beautiful arrangement named in our heading, by which the "American Anti-Incrustation Company" propose to accomplish the desired end, has attracted extraordinary attention. It consists merely of a bar magnet of hardened steel, "suspended horizontally within the boiler, in the upper part of the steam-space,—having its south pole connected with the boiler, and the north pole supported by an insulated hook." It is found that if the outlet for the steam is so situated, that the steam shall pass along this magnetic bar, so placed, in its flow, the deposition of scale is effectually prevented; while on the other hand, if the bar be reversed, so that its north pole is in connection with the boiler, and its south pole towards the point of steam discharge, the deposit takes place with great rapidity. Whatever may be the theory for this, such is the fact; and Dr. Charles Cresson, of Philadelphia, who has made an examination of the apparatus with a view to its explanation, attempts so to do in a paper which has been published in the *Journal of the Franklin Institute*. The following is, as we understand it, the gist of his theory; although it is by no means clearly enunciated.

The thermal currents constantly created within the boiler, by the constantly varying temperature of the particles of water with reference to each other and to the heated shell of the boiler, are in fact electrical currents. The direction of these currents is alternately from the shell to the water, and *vice versa*. When they are from the water to the shell, there is a tendency to the deposit of the matters contained in solution in the water. The object is therefore to maintain a continuous electrical current from the shell to the water. Now the direction of the electrical current in the magnetic bar aforesaid, being, according to the well-known law, at right angles to the bar, by virtue of its polarity,—that is, circling spirally about it, in a direction towards its north pole,—it may be conceived that the friction of the steam, outflowing in the same direction, having also,—as it has—an electrical current developed in it by the magnet itself, may tend to increase, and to keep up, this tendency of the current from the shell of the boiler which is connected with it,—towards the contents of that boiler; rather than to allow the otherwise intermittent current in the reverse direction,—or towards the shell. The magnet therefore has a controlling influence over the thermo-electrical currents, rather by maintaining their continuity in one direction, than by any production of force in that direction. If this be so, we can understand that the reversal of the bar would accelerate the deposit of scale; increasing as it would, the tendency of the current towards the boiler, which in that case, is connected with the north pole of the bar. But for the bar, any change in the condition of the currents playing about within the boiler, by a change in the temperature or electrical condition of its contents, such as might be produced by a slight check to the fires underneath, or the trying of the gauge-cocks, might permit the deposition of scale to be commenced,—for the tendency in such case is towards the boiler, that being the best conductor. In support of this it may be stated, that it is found that if a steel bar, not magnetic, be substituted for the mag-

netic bar, it will gradually become magnetic,—but will have its north pole connected with the boiler. It is also true, that even if a perfect magnetic bar be used, it will, if not occasionally re-magnetized, eventually become reversed as regards its polarity. For this reason it is proposed to use, instead of the simple form of the apparatus which we have described,—that of the permanent magnet,—a powerful electro-magnet; for in this the activity is constantly renewed. The experiments with such have shown an extraordinary increase as regards rapidity of action; producing, in a few hours, results which otherwise would have required as many weeks.

We are reminded by this plan for the prevention of incrustation in steam boilers, of the experiments of M. Duchemin; who, in connection with a commission appointed by the French Government, proposes to prevent the oxidation which goes on so rapidly upon the armor-plates of iron-clads lying at rest in harbor, by connecting every part of such armor with the negative pole of an electric pile placed in the sea-water of the harbor,—which water is itself the exciting liquid of the pile. He finds that not only oxidation, but also the accumulation of barnacles, can be prevented by this means. We shall again refer to his experiments.

THE WHEAT CROP OF 1868.—The shipment of wheat from this port for the harvest-year ending June 31, 1868, will be but little, if any, short of that for the previous year. The shipments of wheat and flour, reduced to wheat, had reached 229,500 tons at the close of April. During the months of May and June of last year there were shipped 35,000 tons. Should the same amount leave this port during the same period of the present year, our shipments for 1868 will reach 264,500 tons—or 10,000 tons more than were shipped during the harvest-year of 1866-7. But as wheat is now coming in very slowly, it is quite evident that the shipments for the present and next month will fall materially short of the corresponding period a year ago. If we allow a falling off of fully one-half (a liberal allowance), we shall come within 7,500 tons of last year—a small figure when compared with the total of 247,000 tons, which will then be the amount for the year. The prospects for the coming harvest are most unusually flattering, and the breadth of ground sown is vastly greater than ever before; so that we may reasonably anticipate a most material increase for 1868-9 over any previous year.

Wheat has now become as much one of the regular productions of the State as gold; and it bids fair ere long to fully equal the latter in value. A careful comparative examination of the cost of producing wheat in this and the States of the Mississippi, with the expenses of transportation added from San Francisco or Chicago to New York, makes a decidedly favorable showing for a greater profit on California wheat; and this, too, with our rates of freight *via* Cape Horn advanced from fifty to seventy-five per cent. over what they were three years ago. The reduction in freight, which must be reached, and the improved facilities for handling the wheat here, now in process of being provided, establishes, beyond all possibility of a doubt, the status of California as among the most favored of the wheat-growing districts in the world. With regard to the extent of our wheat-growing lands, it is well known that we have but just made a beginning in bringing them under cultivation. Vast regions of open country, equal in extent to some of the Eastern States, yet remain virgin soil, waiting only for the extension of railroads, already under way, to bring them into easy connection with tide water. California will, in time, rank fully as high for her agricultural as she now does for her mineral productions.

Balance Docks and Dry Docks.

One of the first essentials to a seaport of any commercial pretensions, is a ready and convenient means for the purpose of examining and repairing ships. It is not many years since the only conveniences for such work were a smooth beach, where ships might be safely laid up at high tide; ordinary "ways," where they might be hauled up in a "cradle," or the still more straining and destructive method of bringing the alternate sides of a ship out of water by "careening." Less than fifty years ago, 2,000 men were required to raise an English 74-gun ship upon the "ways." Less than twenty men will place a ship in an equally favorable position for examination or repairing by the modern dock conveniences for such work.

Dry docks, dug out from the bank, into which a ship may be floated, the gates closed and water pumped out, were the next improvement, and first introduced in England. Some of the most expensive engineering works in either England or America are of this description. The finest dry docks in the world are found in the United States.

This mode of dockage is necessarily expensive, from the large original cost of the structure, as well as from the great amount of pumping required to free the dock from water after the ship is within it. This last item is increased with the decrease of the size of the ship. The great expense attendant upon this mode of dockage led to the construction of floating dry docks, which are of American origin; at least the "balance dock" was invented and patented by an American—a Mr. Gilbert. This is now considered the best and cheapest form of docks which can be constructed. It consists simply of a large closed vessel, built in the form of a parallelogram, of any desired length and breadth, with hollow side walls, rising some twenty-five feet, more or less, according to the other dimensions of the structure, so that when viewed endwise it has the appearance of the letter U. When called into requisition, the dock is submerged, by letting the water into the hollow walls and bottom, so that only a few feet of the upper portion of the walls remain above the surface. The ship is then floated in between the two walls, and the pumps, which are operated upon the top of the walls, are set in motion to pump out the water by the aid of steam. The ship is thus lifted bodily out of her element by the buoyancy of the dock—the water in which she floats running freely out at either end. It will thus be seen that in the use of this dock an amount of water only equal to the weight of the ship has to be pumped, while in the use of a dry dock, all the water surrounding and floating the ship has to be removed by the pumps.

Docks on this principle are sometimes built in sections, called "sectional docks," two or more of which are brought together, according to the size of the ship to be raised; but there are many inconveniences attending such structures, which we have not space at present to point out. The "balance dock" is so called from the readiness with which it can be trimmed or balanced, so as to bring the ship easily up out of the water. This is effected by constructing the interior with several compartments, which may be kept separate or connected at will, so that more or less water can be pumped from one end or the other, as the ship may, on coming up, be found heavier or lighter at either stem or stern.

These docks are coming into very general use in the Atlantic cities, and at least three have been built in Europe,—one each at Havre and Marseilles, and one in some port in Spain. There is also another in use at Havana, which was built in New Orleans. The largest yet constructed is in New York, and is 325 feet long by 100 broad. This

dock has taken up a ship of 6,000 tons burden, weighing 3,680 tons.

This dock recently built at Oakland Point is one of this description. It was built by an association of lumbermen, under the superintendence of Capt. A. M. Simpson, and was to have been employed near where it now lies, at the foot of Beale street, just north of the P. M. S. S. Co's wharf.

The Association which built it, however, found that its use there would greatly interfere with the approach to the docks of the P. M. S. S. Co's steamers and other shipping, and having received a favorable offer of purchase from the San Francisco Dry Dock Company, have sold to that Association, and the dock will be employed at Hunter's Point, in the little cove just this side of the Dry Dock now in process of construction on the Point. The cost of this dock has been about \$110,000. By this purchase, that company will have the control of the only two docks of any considerable size with which this city will probably be provided for many years to come. It is to be hoped that so judicious a tariff will be put upon their use as will avoid the necessity of any further outlay of capital in this direction, until the growth of the city shall exceed the capacity of these two docks to satisfy the demands of our growing commerce.

This dock has been built in the most substantial manner, strongly braced and timbered throughout. It is now fully completed, and will soon be removed from its present locality to Hunter's Point, where the piers are already in process of construction, between which it is to be operated. It is of sufficient capacity for any sailing vessel coming to our harbor, except such monsters as the *Great Republic*, and then only on account of her length; it will lift 4,000 tons, and accommodate a keel of 215 feet, at twenty feet draught. It will be ballasted with 800 tons of rock, and will hold 2,300 tons of water, let in by gates on the side; the water will be contained in twelve reservoirs or compartments, and can be pumped out of any one or all of them at the same time, though the usual plan will be to work the four pumps on each side, pumping from the reservoirs of each side, and balancing the dock by stopping one set if necessary; if one set should be out of order then all the sliding gates would be opened, and one set of pumps could do the discharging. Each set of four pumps has a separate engine and boiler, all made by Hinckley & Co., Fulton Foundry. The engines are slide valves with the Pickering governor, and are twelve inches in diameter, with twenty-four inches stroke; the pumps are of brass, twenty inches in diameter and twenty-four inches stroke, worked by large cog wheels. When working together the eight pumps will discharge 77,000 cubic feet of water in an hour. The boilers are of peculiar construction, having the furnace inside of the boiler, and not separated by brick work—an economy in heating the water and protection against accidental fire. Steam was got up a few days since and the machinery put in motion, working admirably.

THE LATEST EDITION of Webster's Unabridged Dictionary received the labor of many eminent and leading men in the various special branches of science and literature, whose combined services were equivalent to the period of an average lifetime. Five years was devoted by a proficient Professor in Germany to etymology alone. The illustrative quotations are choice and numerous. To the practical man, without a classical or scientific education, it will not only prove immensely popular, but indispensable. It contains over 3,000 illustrations, 114,000 words, and 1,840 royal quarto pages. Examine this edition of "Webster" before you rest satisfied with the old—or any other dictionary.

California Academy of Sciences.

REGULAR MEETING.

MONDAY EVENING, May 4, 1868.

Vice President Dr. James Blake in the Chair. About 30 members present.

NEW MEMBERS.

The following persons were elected members of the Academy: Dr. C. T. Deane, Joseph Paxson, Gen. J. J. Miller, A. Roman, Theodore Mudge, John B. Felton, Dr. J. Blumson, Thos. A. Barry, Dr. R. Beverly Cole, Calvin Brown, F. M. Pixley, H. L. Davis, Julius Bandmann, Thos. M. Cash, John Hucks, J. F. Lohse, J. W. Willard, Benj. A. Patten, Justin P. Moore, August Emory, A. Harpending.

ELECTION OF PRESIDENT.

The Chairman stated that the election of a President, *vice* Professor Whitney, resigned, was in order. Mr. Stearns nominated Dr. James Blake, and no other being made, the votes of the Academy were taken, with the following result: Dr. Blake 23; Dr. Gibbons 2; Mr. Bradley 1.

Dr. Blake having been declared elected, returned thanks to the Academy for the honor conferred upon him, promising to do all in his power for the interests of that body.

DONATIONS TO THE CABINET AND LIBRARY.

Dr. Gibbons, on behalf of Mr. C. A. Eastman, presented the cabinet with a fine specimen of the *hippocampus Major*, and a centipede preserved in spirit, both from Mexico. He also presented the library with a Japanese work, containing illustrations of various species of fish, on behalf of Mr. Joseph Tilden.

Dr. Cooper remarked that these Japanese illustrations were remarkably correct, considering that they were produced by a people who knew nothing of anatomy. So much was this the case, that a series of Japanese fishes had been described solely from these drawings.

A large piece of wax, found on the Klatop shore, about twenty miles south of the Columbia River, was donated to the cabinet by C. M. Scammond. Dr. Cooper said that there was nothing remarkable in the fact of wax being found there, as it undoubtedly was part of the cargo of a Japanese vessel that was wrecked in that locality several years ago. Amber was also found there, in small quantities, but that was a natural production.

DISTRIBUTION OF MOSSES AND SHELLS.

Dr. Bolander stated that Dr. Kellogg had lately found a moss at Point Lobos, which had been hitherto supposed to grow only in the Sierras.

Dr. Stearns stated that he had recently made a trip to Monterey, in company with Mr. Harford, in quest of shells, and they had found many species alive not found before; they also discovered some *nudibranchs*, and being unable to decide as to their species, had turned them over to Dr. Cooper, who has described most of the naked mollusks of this coast.

THE UTILIZATION OF AIR.

Mr. R. d'Heureuse, the patentee of the Air Method for Fermenting Wines, some account of which was given in a late number of the MINING AND SCIENTIFIC PRESS, read an interesting paper on "The proper use of air in reference to Industry and Medicine," a synopsis of which will be given in our next issue.

DECAY FROM OVER CULTIVATION.

Dr. Gibbons stated that there was now in this market a small red apple, which was very fair in its appearance, but the remarkable feature of which was that it began to rot at the core, with a dry, bitter rot. These apples came from an orchard in Alameda, where they hung side by side with grindstone apple. They were called by some, wine sap, but were not the genuine wine sap. None of the grindstone apples presented the same peculiarity; and of the smaller variety, not one in twenty was exempt from it. He thought that the germ of a fungus was perhaps introduced into the fruit while it was blossoming, and developed subsequently on the inner surface of the cells adjoining the seed. This was one method adopted by nature to put an end to cultivated varieties propagated by grafting. He had noticed several old species of fruit trees in the Atlantic States, die out in a similar way; and the same effect was observed often in high-bred cattle. Nor was the human family exempt from the operation of this law, as was shown in the case of several old races, which, being trained too high, exhibited a tendency to die out.

Considerable desultory discussion took place upon the subject, but the opinion was generally concurred in that the decay came from the presence of fungi.

PROPOSED ESTABLISHMENT OF REGULAR LECTURES.

Dr. Bolander suggested that the meeting might be made more interesting and profitable, if arrangements could be made for the delivery of short lectures of from thirty to forty minutes, at each meeting,—the subject of said lecture to be then open for general discussion by the meeting, in absence of any other less important or less interesting matter. Dr. Stout suggested that the meetings should be held every Monday evening, instead of on the first and second Monday evenings of each month. After considerable discussion, a committee, consisting of Drs. Cooper, Kellogg, Gibbons, and Messrs. Bolander and Bloomer, was appointed to draw up a plan for the institution of such lectures.

RESIGNATION OF MR. STEARNS.

Mr. Stearns stated that as he was compelled to leave the State next month, and should be absent a twelve-month, he was obliged to resign his position as Director of the Museum. He hoped that the Academy would progress in his absence, and assured them that he would do all he could for them abroad. On returning he proposed to put his hand to the plow again.

Dr. Stout gave notice of an amendment to the Constitution, altering the life membership from \$200 to \$100.

SIXTH INDUSTRIAL EXHIBITION

—OF—

The Mechanics' Institute.

THE BOARD OF DIRECTORS OF THE MECHANICS' Institute hereby give notice that the Sixth Industrial Exhibition of that Association will be held some time in August next, in a building to be erected for the purpose, in Union Square, in this city. Every preparation will be made to accommodate exhibitors and visitors, with a view to make the Exhibition profitable, instructive and pleasant to all parties.

During the three years which have intervened since the holding of the last Exhibition in this city, the manufacturing, mechanical, scientific and useful, and ornamental arts have made unprecedented progress on this coast, and it is believed that the proposed Exhibition will exceed any other in value that has ever been held on the shores of the Pacific.

The plan of building to be erected, which has been adopted by the Institute, is believed will prove to be the best adapted both for display and convenience of the public, of any building ever erected in the State. The building will be perfectly water-tight, being covered with a shingle roof, so that no damage from the elements can be anticipated.

All parties who are interested in any of the branches of Manufactures, Mechanics, or the Arts and Sciences, are invited to exhibit in the proposed Exhibition, and to share in the publicity and consequent profit which always attends such enterprises. Suitable premiums will be offered, and the specific date of opening the Exhibition will be published at some future time.

By order of the Board of Directors. 19v16 HORACE D. BUNN, Cor. Sec'y.

WANTED

—AT—

T. M. TURNER'S

NEW AND EXTENSIVE

Stock and Sale Yards and Stables,

Tenth and Howard Streets,

The Bull's Head of San Francisco.

TO FILL ORDERS:

50 LARGE DRAFT HORSES, 1,300 to 1,400 POUNDS weight, and any number of horses of 1,100 pounds and upwards, suitable for Car Horses, Job Wagon, Brewery, Buggy and Family Carriage; and also smaller horses for saddle and small vehicles; also, Milch Cows, Beef and Work Cattle, and all classes of Live Stock.

Just arrived and coming daily, a fine lot of good American Horses, suitable for Draft, Driving, and all kinds of work. The THOUSANDS of LIVE STOCK I have sold in the short time I have been here in business, is an indication of what I may do in the future. My Spring Auction Sales will commence now for the sale of hands of Broke and Unbroke Horses, and all classes of Live Stock.

Cash advanced on Stock for sale. Stabling and Corral work, with managers and sheds for several hundred head of various kinds of stock at a time. Stock Raisers desiring to get thorough-bred Stock of any kind, can do so through me, as I am extensively acquainted with Stockmen of various parts of the country and Eastern States.

I HAVE LEFT A FEW PAIR OF THOSE fine thorough-bred ANGORA or CASIMERE GOATS, recently brought from Georgia, by Mr. E. Holland, from the celebrated flock of Mr. Peters, which stood a comparison at the World's Fair at Paris, and were pronounced as fine as any in the world, which I will sell at reduced rates from our former sales of \$1,000 a pair. In order to give stock raisers a chance, or, if desired, will sell ten or twelve Bucks at \$250 each, and reserve the Ewes. Full paid green given of each one. 19v16-14m1st

a very large variety of Gear and other Patterns, which,
with our superior tools and appliances, give us facilities for
doing first class work unequalled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,
Horizontal and Vertical, for either Stationary or Marine
use.BOILERS—High and Low Pressure,
Pump, Pipe and Sheet Iron Work of every kind.Quartz Mill Work,
Including High and Low Mortars for wet or dry crushing;
Furnace Irons for Roasting Ores; Freiberg Barrels;
Varney's and Wheeler's Amalgamating Pans
and Settlers; Stamp Shoes and Dies of
best White Iron; Russia Iron
Screens, etc., etc.Flour Mill, Saw Mill and Sugar Mill Work in every variety;
Pumping and Hoisting Machinery; Hawsbrow's
Patent Challenge Pump, for Domestic,
Ship and Mining use—the most
approved and successful
Pump manufactured.

Castings of every description, Iron and Brass.

We would call special attention to "Wright's Patent Vari-
able Cut-off Engines," of which we are the sole manufac-
turers on the Pacific Coast, under license from the Wood-
ruff & Beach Co., Hartford, Ct. As a simple, effective, re-
sulting, tireless Engine, this is, without doubt, the best
Engine made in the United States.Orders promptly attended to. Prices as low as possible
for first-class work, and we intend to do no other.GODDARD & CO.

COOSE BAY COAL.

The Cleanest Burning and Most Economical
Fuel on the Coast.

Sold by all dealers in this city and Oakland.

EDWARD FLANAGAN,
Coarse Bay Coal Company,
7v15-3m No. 606 Battery street, near Jackson, S. F.

FUEL COÖPERATIVE UNION.—This Associ-
ation has fitted up their main depot, Fourth
street, corner of Freelon, in good shape,
and are now nearly ready to commence lay-
ing in stock, when shareholders and the
public generally will be supplied with all
articles of fuel. It is confidently believed
that a much needed reform will be secured
by this Association, to all, particularly to
the holders of shares, inasmuch as to them
will accrue all the profits of the business.
The Association was incorporated March
5th, with a capital of \$20,000, divided into
1,000 shares, and organized with Judge H.
J. Tilden as President, and Dr. E. F. Bun-
nell Secretary and Treasurer. About the
tenth part of the capital stock is disposed
of, with fair prospects for an early distribu-
tion of all the shares. A share in this com-
pany—price \$20—entitles the holder to a
credit for thirty days to the amount, and a
dividend of the net earnings at the end of
the month, the same as if he was not a debtor
to the company. The managers expect
to be in full operation in a very short time.
Coöperation in business cannot but be ben-
eficial to all parties interested if ordinary
skill and economy is practiced in its man-
agement. All such undertakings have our
warmest sympathy and heartiest coöpera-
tion.

ALUMINUM BRONZE.—This alloy of cop-
per and aluminum is not manufactured by
combining these two metals directly to-
gether. Mr. Evrard makes use of a kind
of pig-iron containing aluminum. This is
slowly heated up to the melting point, and
the copper then added. The aluminum,
having a greater affinity for the copper than
with the former. After being stirred, the
whole is allowed to cool slowly, so as to
permit the aluminum and bronze, which is
denser than iron, to settle to the bottom of
the crucible. Silicium bronze may be made
in the same manner.

TANNING WITH CHESTNUT WOOD.—A tan-
ner in Lyons, France, finds that the tannin
obtained from the wood of the chestnut, in-
stead of the bark, makes leather of a pec-
uliar fineness, uniformity, and excellence
of color, and superior quality in all respects
as compared with the best oak-tanned.

The fame of Muller's Brazilian pebble
spectacles has reached Europe. All the
leading oculists recommend them. Re-
member the place—No. 205 Montgomery
street.

THE CARBON PRINTS.—This new style of
photographs is likely, it seems, to rival the
silver print. The New York World thus
speaks of it:

The carbon process is of English origin,
and consists of printing on a tissue of car-
bon or other pigments, rendered sensitive
in a bath of bichromate of potash solution,
instead of on the silver paper formerly
used. It has long been the study of pho-
tographers to invent some process of print-
ing by which nitrate of silver could be dis-
pensed with. This was desirable, because
it is impossible to accurately reproduce the
finer details of the negative, and on account
of liability of the best silver print to fade
and discolor with time. The new carbon
prints now challenge competition with the
best silver positives. * * * The effect
of the finished picture is similar to that of
a porcelain plate cast in relief, through
which the light produces the soft shades of
a delicate mezzo-tint engraving. Placed
beside a carefully-finished silver print from
the same negative, the inferiority of the
latter is noticeable. The print is flat, ex-
pressionless and dead, while the carbon
picture is fairly plastic in effect, and the
head stands from the paper with a round-
ness that is truly remarkable. It is very
certain that no similar effect could be pro-
duced in silver. We welcome this discov-
ery as the great desideratum so long sought
by scientific photographers, and can only
wish that an American had discovered it.

GROUND on the Humboldt Bay and San
Francisco Railroad, at Sancelito, has been
broken.

RETURN OF THE SOUTH AMERICAN EXPEDITIONS.—The scientific expedition that started from William's College some seven or eight months ago has returned. The party traveled in two divisions. One section started from Guayaquil upon the western coast, crossed the Eastern Cordillera of the Andes, penetrated to the river Napo, and thence by canal to steam navigation on the Amazon. The other started from Caracas upon the coast of Venezuela, struck inland to the Orinoco, and down the Rio Negro to the Amazon, traveling a distance of 2,500 miles by canoe.

CARD.

THE UNDERSIGNED, SINCE DISPOSING OF HIS Gallery on Montgomery street, has seldom been in the street without being asked where the best photographs were taken. Now, for the benefit of his friends and the public generally, he would recommend them to go to the COSMOPOLITAN ART AND PHOTOGRAPHIC GALLERY, No. 523 Kearny street, now owned and occupied by Messrs. HALSEY & SCRIPTURE. Both of these gentlemen are professional photographic artists—one of them having been in the business more than twenty years—and cannot be surpassed by any one in the State.

Persons wishing photographs taken will do well to give them a call. The above named gallery is one of the finest and most convenient in San Francisco, it being situated on the second floor, and its proprietors are the most accommodating and gentlemanly men in the business.

N. B.—Prices as low as at any other Gallery in the city. Solar Printing for the Trade.

Also Stereoscopic Views of California Scenery, at wholesale and retail, at the Cosmopolitan Art and Photographic Gallery, No. 523 Kearny street.

HALSEY & SCRIPTURE,
Proprietors.

Mining Secretary.

THE SUBSCRIBER, HAVING SERVED FOR THE LAST five years as secretary of various mining companies, feels fully competent to serve in that capacity. Any parties wishing to secure the services of a Secretary can be accommodated on reasonable terms. Information given, and all necessary papers correctly made out.

Having had a long experience in the purchasing of goods and machinery for miners, parties in the mines will find it to their advantage, where purchasing agents are employed, to send their orders to the undersigned.

Support Home Manufactures.

California Pioneer Fuse

MANUFACTURING COMPANY,

MANUFACTURERS OF

HOSE AND TAPE FUSE,

A New and Superior Article for Blasting in very wet ground, or under water.

Great difficulty has heretofore been experienced by miners, and others in the use of Fuse, which has been subjected to deterioration from exposure to dampness during transportation, or during the great length of time which has passed between its manufacture and use. In addition to great pinstaking in the manufacture of the California-made Fuse, the above and many similar objections are entirely obviated, and the operator can always depend with certainty upon the burning of his fuse.

It is often the case that extra lengths are required, as exploding tunnels, etc., longer than is furnished in the imported article. Fuse of every desired length or size can be made to special order, at the above manufactory.

Manufactory, Potrero, San Francisco.

THE UNDERSIGNED BEG LEAVE TO CALL THE ATTENTION of the public to a new and superior article of BEDS, LOUNGES, etc., manufactured by them, at 353 and 355 Tehama street, between Fourth and Fifth, San Francisco.

The Upholstering is done upon Huntington's Patent Elastic Springs, the superiority of which over all others will readily be seen on inspection.

If you want a comfortable and durable BED or LOUNGE, please call at the Factory, 353 and 355 Tehama street, or at ROKOHL, BUTLER & PARK'S, Montgomery street, corner of Pine, and examine our Spring Mattresses and Lounges, before buying elsewhere.

15v16-3m HUNTINGTON & TORREY.

THE GOLDEN ERA.

Founded in 1852, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent.

THE GOLDEN ERA

Is the most universally popular of all the Weekly journals. It presents forty-eight columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected matter. It is a welcome guest in Cottage and Cabin; the favorite at the fireside in city and country; the most useful, agreeable and altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe and elsewhere. Every household in the mountains and valleys, the cities, towns and mining camps of California, and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor. Inspired with the genius of the age, it is progressive, and aims not so much at distinction as a newspaper, as at honorable success in its capacity of a great Moralizing and Improving Influence, exercising a positive power for good, and wielding a permanent influence, many able and eminent writers choose its columns as a means of communicating with the public. No effort will be spared to make it a thoroughly California newspaper, and worthy of the support of all classes of our citizens.

Rock Drilling Machines.

FOR SALE.—ROCK DRILLING MACHINES (Garner's Patent) for sinking shafts. One man with this machine, can do as much tunnel and drilling work in one day as four men can do with any other machine. Apply to JOHN OVERKEND, Bulletin Press Room, 511½ Clay street, San Francisco. 15v16-3f

MANGANESE MINE.—Manganese is being shipped from San Joaquin county to this city, for transshipment to the Atlantic States and Europe; 540 tons of the mineral are now in store at North Point.

STILL SETTLING.—The ground over the Chollar-Potosi mine, where Wood & Goe's store was swallowed up last summer, is still settling. There are no buildings left in its immediate vicinity.

Rates of Postage on Printed Matter to Europe and Asia.

The Post Office Department has made arrangements by which a number of European and Asiatic countries, hitherto beyond the reach of our mail communication except by letter, are brought within the range of delivery of all, or nearly all, United States mail matter. It is a singular fact, unknown probably to most persons who have not occasion to learn it by unpleasant experience, that there was a considerable region in the civilized world where an American traveler might not receive a newspaper directly from home.

Under the arrangement now completed, prepayment of postage (sometimes at high rates), is made necessary in all cases. The following official statement gives a full list of the countries—with some of which there has been regular communication—that are now included in the delivery by way of Hamburg and Bremen:

Rates of postage on newspapers and other printed matter (periodicals, etc.) sent from the United States to countries in Europe and Asia, by Bremen or Hamburg mail—prepayment compulsory:

NEWSPAPERS—MARKED AS FOLLOWS:

Bremen, by Bremen mail—2 cents each.
Hamburg, by Hamburg mail—2 cents each.
Prussia, Austria and German States, by Bremen and Hamburg mail—3 cents each.
Lunenbourg, by Bremen mail—3 cents each.
Lunenbourg, by Hamburg mail—3 cents each and 1 cent per 1½ ounce.

Schleswig Holstein and Denmark, by Bremen or Hamburg mail—3 cents each and 1 cent per 1½ ounce.
Sweden, by Bremen or Hamburg—3 cents each, and 1½ cent per 1½ ounce.

Norway, by Bremen or Hamburg—3 cents each, and 3½ cents per 1½ ounce.
Holland, by Bremen or Hamburg—3 cents each, and 1 cent per 1½ ounce.

Russia, by Bremen or Hamburg—3 cents each, and 1 cent per 1½ ounce.

Switzerland, by Bremen or Hamburg—4 cents each.

Italy, by Bremen or Hamburg—3 cents each.

Turkey, by Bremen or Hamburg—3 cents each, and 5½ cents per 1½ ounce.

Greece, by Bremen or Hamburg—3 cents each, and 5½ cents per 1½ ounce.

Gibraltar, Spain and Portugal, by Bremen or Hamburg—3 cents each, and 2½ cents per 1½ ounce.

Austria, India and China, by Bremen or Hamburg mail by way of Marseilles—3 cents each, and 9 cents per 1½ ounce.

Austria, India and China, by Bremen and Hamburg mails, via Trieste—3 cents each, and 2 cents per 1½ ounce.

PERIODICALS, ETC.

Bremen, by Bremen mail—1 cent per ounce.
Hamburg, by Hamburg mail—1 cent per ounce.
Prussia, Austria and German States, by Bremen or Hamburg—1½ cent per ounce.

Lunenbourg, by Bremen mail—1½ cent per ounce.
Lunenbourg, by Hamburg mail—1½ cent per ounce, and 1½ cent per 1½ ounce.

Schleswig Holstein and Denmark, by Bremen or Hamburg—1½ cent per ounce and 1½ cent per 1½ ounce.

Sweden, by Bremen or Hamburg—1½ cent per ounce, and 2 cents per 1½ ounce.

Norway, by Bremen or Hamburg—1½ cent per ounce, and 4 cents per 1½ ounce.

Holland, by Bremen or Hamburg—1½ cent per ounce, and 1½ cent per 1½ ounce.

Russia, by Bremen or Hamburg—1½ cent per ounce, and 1½ cent per 1½ ounce.

Switzerland, by Bremen or Hamburg—1½ cent per ounce, and 1 cent per 1½ ounce.

Italy, by Bremen or Hamburg—1½ cent per ounce, and 2 cents per 1½ ounce.

Turkey, by Bremen or Hamburg—1½ cent per ounce, and 5½ cents per 1½ ounce.

Greece, by Bremen or Hamburg—1½ cent per ounce, and 5½ cents per 1½ ounce.

Gibraltar, Spain and Portugal, by Bremen or Hamburg—1½ cent per ounce, and 2½ cents per 1½ ounce.

Austria, India and China, by Bremen or Hamburg mail by way of Marseilles—1½ cent per ounce, and 9 cents per 1½ ounce.

Austria, India and China, by Bremen or Hamburg mail, by way of Trieste—1½ cent per ounce, and 2 cents per 1½ ounce.

These charges are in each case in full to destination, combining rates between the United States and Bremen or Hamburg, and the rate between Bremen and Hamburg to points of delivery.

Economy in Advertising.—The Mining and Scientific Press is the best and most economical mining advertising medium in this city. Our terms are less than one-half the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The Press contains proportionally a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

ELECTROTYPE CUTS, ENGRAVINGS, ETC.—Our Job Printing Office is abundantly supplied with elegant engravings, ornaments, and other embellishments to suit the various branches of industry in this State.

Trades and Manufactures.

AN INSTRUCTIVE BOOK!

Prof. LAYRES'

ELEMENTS OF COMPOSITION,
BELLES-LETTRES AND ORATORY

For Scholars, Teachers, Lawyers all Professional Persons, and those of Common

Education, who would improve the
Eloquence and Effectiveness
of their Composition and
Manners of Address.

Price, postage paid, \$1.10

This is a new publication, and in style and treatment of this important subject, is original, simple, plain and comprehensive. The author, Prof. LAYRES (a meritorious Teacher of good standing in California, and a sound thinker and reasoner,) in his preface says: "The method pursued by the Author in developing the subject of Composition, is both the syntactical and analytical. The former is necessary to teach the theory, the latter the practice of the art; and as these are both indispensable to the scholar, so are also the two methods, as the sequel will show."

The Work has lately been approved and authorized by the State Board of Education for use in the Public Schools. To further illustrate the varied and popular endorsement the book has so rapidly received, we quote the following

RECOMMENDATIONS:

It is simple, concise, and well arranged. It seems to be a work of great value.—*John Seely.*

I am prepared to concur in the recommendation of the Honorable Superintendent of Public Instruction.—*J. C. Felton.*

After a careful and thorough perusal of the same it was in my power to give, I think, the conclusion that, for conciseness, correctness, and precision of definition, as well as for completeness and simplicity of style, it was, and would be, without a rival. I regard your work as the best of its kind. I know of but few men in any profession who would not be benefited by its careful study.—*Wm. M. Hill.*

I regard it as one of the best treatises upon these important branches—perhaps the only one obtainable possessing equal advantages—combining brevity with clearness, simplicity, and of such simplicity in its arrangement as to be readily understood by the advanced pupil.—*F. W. Hatch.*

It is admirably arranged to develop the correct idea of the analysis and synthesis of language, and the amplification of ideas into sentences and periods. The style is clear, terse and pleasing. I do not hesitate to recommend it as a great acquisition to our text books.—*James Denman.*

I am happy to express my conviction of the value of the work. It would give me much gratification to see so thorough and excellent a treatise emanate from young California.—*Martin Kellogg.*

I recommend it to all those who wish to obtain a book that will give them definite ideas on this subject, and teach them to express their thoughts and feelings in a clear, simple, and forcible manner.—*Caroline L. Allen.*

I regard the book about to be published as far superior to any work extant upon that subject.—*Wm. S. Hunt, A. M.*

I believe the work will be a valuable and much needed addition to our school text-books.—*Herman Perry.*

You have brought the results of a profound analysis, and made them available, in a practical form.—*J. H. Brayton.*

I can recommend it particularly to my young friends of the legal profession, as a source from which they may be able to learn much of value as special pleaders and advocates at the forum.—*John Curry.*

The subjects upon which you treat have heretofore been too much neglected in the education of young men in America. Exactly calculated to interest them. It will soon become a necessity in every lawyer's library.—*Charles A. Tuttle.*

Its clearness and comprehensiveness make it easy.—*G. W. Davis.*

A gentleman of varied learning and ripe culture, who has half a dozen languages at his tongue's end. He seeks to teach the student not only how to take sentences apart, but how to construct them. His system is entirely original. We know of no work in which can be obtained so lucid an exposition of the elements of composition, and such valuable assistance in learning how to put his ideas into language. Prof. Layres has done the cause of popular education good service.—*S. F. Baldwin.*

This is a San Francisco book by a San Francisco author. It contains 166 pages, and is altogether creditable to San Francisco. It meets a public want, and needs it in a form and size cheap and convenient, and in reach of the humblest.—*Alta California.*

The writer, the lawyer, the minister, or the statesman, may study its rules and definitions with profit. Nothing conduces more to the purity of a national literary taste than a general and thorough knowledge of the rules by which the construction of language is governed.—*S. F. Times.*

Prof. Layres plunges at once "in medias res." He seizes a sentence (which is the unit in composition, whether written or spoken,) holds it up before you; tears it to pieces before your eyes—or rather, we should say, neatly and skillfully dissects it—displays one by one its several parts; unites you thoroughly acquainted with each, in its entirety; and then shows you how to put them together again. A series of such exercises, increasing in complexity as gradually as you do not feel the difficulty, and the thing is done; you are master of the subject.—*Mining and Scientific Press.*

Its design is to show that ideas can be so arranged as to increase their power; in short, to teach the mechanism of composition and oratory. A desideratum long felt, and supplied.—*S. F. Examiner.*

The most eminent educators in California give it their hearty approval, and we concur.—*Margaret Appeal.*

Not only one of the best of its kind, but what is still better, one of the briefest. It contains 166 pages.—*Virginia Enterprise.*

Price, \$1.10. Sent by mail, postage paid, without extra charge. Liberal reductions made to the Trade, Teachers and Schools, ordering by wholesale. Orders received by our Travelling Agents.

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setters for themselves, at the

PACIFIC FOUNDRY,
San Francisco.

SUPERIOR CUT-OFF ENGINES.

We desire to call the attention of Engineers, Manufacturers, and Millmen, to the celebrated

Hartford Engine,

With Wright's Patent Variable Cut-off, which we are now manufacturing under a license from the Woodruff & Beach Iron Work Co., Hartford, Ct. To parties wishing a First-class

Fuel-Saving Engine,

Simple and durable in construction, this Engine is offered in the belief that it is superior to any other manufactured. It enjoys the very highest reputation in the Atlantic States, where it is well known; over 300 of them having been built by the Woodruff & Beach Company, and being now in successful operation.

BLAKE'S QUARTZ BREAKER!

PRICES REDUCED!

MACHINES OF ALL SIZES FOR SALE

—BY—

WM. P. BLAKE,

Corner First and Mission streets, or Box 2,077
3v13f SAN FRANCISCO.BLAKE'S PATENT
QUARTZ CRUSHER.

CAUTION!

The owners of the Patent for this valuable machine, in order to facilitate the protection of their rights against numerous infringers, procured, some time since, a reissue of the Patent, bearing date January 9th, 1866.

This Patent secures the exclusive right to employ in Stone-Breaking Machines Upright Convergent Jaws, actuated by a Revolving Shaft.

All persons who are violating the Patent by the unauthorized making, selling or using machines in which quartz or other material is crushed between upright convergent jaws, actuated by a revolving shaft, are hereby warned that they are appropriating the property of others, and that they will be held responsible in law and in damages.

Several infringing machines are made and offered for sale in this city, upon which Patents have been obtained. Manufacturers, purchasers and users, are notified that such Patents do not authorize the use of the original invention, and that such machines cannot be used without incurring liability for damages.

BLAKE & TYLER,
Agents for the Pacific Coast.

NOTICE TO MERCHANTS

—AND—

MANUFACTURERS.

Moore's Patent Friction Hoist.

Now in successful operation in the principal stores in San Francisco, possesses many advantages over the common Hoist—viz: Greater strength; less danger in working; as goods require no slinging or lashing, consequently make fewer breakages; requires one man less to operate it; stops with the load at any point, without any tacking or attention from the operator.

The undersigned take this opportunity to notify all whom it may concern that they have secured, by letters patent, the application of a friction pawl, or stop, to hoisting machines, and that they will prosecute any party making or using any machine infringing upon the same.

Brodie's Patented Improvements

FOR THE TREATMENT OF

Gold and Silver Ores.

BRODIE'S PATENT IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:

No. 1—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price, \$600

No. 2—Or 16-inch Crusher, capable of similarly putting through five to six tons per hour—price, \$850

No. 3—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour—price, \$1,200

EXPLANATION OF THE ABOVE CRUSHERS.

The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the opening. F, which can be regulated at pleasure, so as to graduate the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, D, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Folsom county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Folsom County.

RAWHIDE RANCH, Folsom County, Sept. 28, 1866.

JAMES BRODIE, Esq., San Francisco—My Dear Sir: I feel it my pleasure to inform you that I have for the past three months had one of your largest sized Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which has entirely met my expectations; and I have no hesitation in recommending it to the care in need of a mine, for the rapid, cheaply and properly preparing quartz for the stamps. Yours truly,

R. P. JOHNSON,
Supt. Rawhide Ranch Quartz Mill.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

For the present it is not intended to grant licenses for the use of the improved German Barrel, for a longer term than twelve months. All persons desirous of procuring the same, without having recourse to legal proceedings, for past infringements, or desirous of receiving Letters of License for the limited period named, are requested to address as below.

A diagram, with explanation of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.

BRODIE'S PATENT WIND-ELAST SEPARATOR FOR DRY CRUSHING.—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866.

A SAFE,
CERTAIN,
AND
Speedy Cure
FOR
NEURALGIA,
AND ALL
NERVOUS
DISEASES.

Its Effects are
Magical.

It is an UNFAILING REMEDY in all cases of Neuralgia Facialis, often effecting a perfect cure in less than twenty-four hours, from the use of no more than two or three PILLS.

No other form of Neuralgia or Nervous Disease has failed to yield to this

WONDERFUL REMEDIAL AGENT.

Even in the severest cases of Chronic Neuralgia and general nervous derangements,—of many years standing,—affecting the entire system, its use for a few days, or a few weeks at the utmost, always affords the most astonishing relief, and very rarely fails to produce a complete and permanent cure.

It contains no drugs or other materials in the slightest degree injurious, even to the most delicate system, and can ALWAYS be used with

PERFECT SAFETY.

It has long been in constant use by many of our most eminent physicians, who give it their unanimous and unqualified approval. Sent by mail on receipt of price, and postage.

THE OLD ENGINE AT CARRON.—The following item is from an account of a visit to the Carron Iron Works,—the birth-place of the Scotch iron trade, and for a long time the most extensive foundry in Great Britain. The account is from the Scotsman: "The site of the establishment was chosen on account of the abundant and convenient supply of water available. The blast was created, the tilt hammers worked, and the lathes and other machines driven, by water applied over a large number of wheels. As the premises were extended, the supply of water became inadequate, and somewhat anomalous means of overcoming this difficulty were devised. While James Watt was working out his improvements on the steam-engine, he entered into partnership with Dr. Roebuck, of the Carron Iron Works. During the time he was associated with Dr. Roebuck, he erected a large steam-engine at Carron, and this is the anomalous contrivance we have alluded to. Instead of the power of the engine being applied directly to the machinery, it was merely employed to pump back into a reservoir the water that had passed over the water-wheels, and so enable it to be used again and again. The engine was fitted with four pumps, which raised to a height of thirty-six feet, forty tons of water per minute. This old servant of the company has been sadly neglected. Though it has been allowed to remain in its original position, nothing has been done to prevent its falling into decay. The engine-room is crumbling into ruins, and the ironwork is black and furrowed by oxidation. As one of the earliest engines ever made, this piece of mechanism is an object of much interest; and it is to be regretted that the very little care necessary for its preservation was not taken. The engine, which is on the atmospheric principle, has a cylinder six feet in diameter, by eight feet in depth, and the beam is about thirty feet in length. The steam was supplied by three cast iron-boilers, two of which are globular in shape and measure about fifteen feet in diameter. About thirty years ago, this engine was superseded by one of improved design, applied directly to the machinery, and since then the use of water power has gradually died out."

NITRO-GLYCERINE AS A POISON.—As this substance is coming gradually into use, it is well that its effects when taken into the system,—as it is quite possible might accidentally happen,—should be generally known; so that all who are brought daily into contact with it may observe the proper precautions. Not being volatile, there is no danger that it might be accidentally inhaled; nor does it produce any effect when applied externally; yet it is said that workmen who handle it sometimes suffer from headache, owing to its absorption through the skin. But if swallowed, its effects are most violent. Mr. Schuchardt gives, in the Hanoverian Journal of Practical Medicine, the following account of his experiments with it:

In order to study its effect upon himself, the author took one drop at 10 A. M.; five minutes after, great dizziness came on, accompanied by weakness of sight, headache, with throbbing in the temples, weariness, sleepiness, strong aromatic taste in the mouth, a burning feeling in the throat, and pain in the region of the heart. An hour later, whilst incautiously endeavoring to take some nitro-glycerine out of a bottle by means of a tube, he received a considerable quantity in the throat. Although he spat it out at once, and rinsed out his mouth with alcohol, he felt the above described symptoms return, so that he was obliged to go to bed. He then fell into a half-senseless condition, which lasted some hours, and left behind it violent throbbing headache, with sensitiveness to light, giddiness, and trembling in the whole body. At first a feeling of warmth spread over the whole system, and the pulse increased in speed; later, a feeling of cold came over him; besides this, there was a burning sensation in the region of the heart, and nausea, but no vomiting. On the following day every symptom of poisoning had disappeared.

ANTIDOTE FOR STRYCHNIA.—Dr. J. Bartlett strongly recommends common salt for strychnia poisoning. He reports as many as twenty experiments on dogs, in which violent symptoms following large doses of strychnia, ceased after the use of emetics, the animal being first drenched with water holding in solution several handfuls of salt.

Chicago Medical Times.

SETTING TYPE BY ELECTRICITY.—A Washington correspondent of the *American Artisan* thus writes: I have before me a book containing 24,993 oms of solid matter, the whole of which was both "set" and "distributed" in six hours and thirty-nine minutes by machinery. But the wonder need not stop here. By means of one of these machines connected by telegraph with the Capitol, the reporter can set the type himself, the machine being in New York and he in the Capitol! It is simply a question of time and money—that's all.

TOTAL MILES OF TELEGRAPH.—The total length of telegraph lines throughout the world is upwards of 178,056 English miles, consisting, on the average, of a triple line of wires. The following is the length of lines in the various countries, according to the latest returns:

English Miles.	English Miles.
1866—Germany.....24,347	1865—Sweden.....3,207
1865—Russia.....22,992	1864—Belgium.....1,889
1864—France.....18,691	1863—Switzerland.....2,100
1864—Great Britain and Ireland.....16,297	1864—U. S. of America.....52,937
1865—Turkey.....8,065	1865—Canada.....3,030
1863—Italy.....8,216	Total.....167,974

To this must be added the two Atlantic cables, the total lengths of which are about 4,317 English miles (3,754 nautical miles), and the total length of the other submarine cables amounts to near 5,765 miles.

POISON OAK.—Prof. G. Dowell, in the *Galveston Medical Journal*, recommends in cases of poisoning by *Rhus Toxicodendron*, and other poisonous species of the *Rhus*, to bathe the parts with a solution of caustic potash, sufficiently strong to render the skin soapy. This "has never failed to cure it immediately," although he has used it in hundreds of cases, including himself. The potash is used in the proportion of ten grs. to the ounce of water, but may be increased in strength as needed.

ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.

Awarded the First Premium at the Paris Exposition.

ADAPTED
FOR
Smelting,
Foundry,
Mining
and
Steamships.

REQUIRES
Fifty Per Cent.
LESS POWER
Than any Blower
now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver mine; Gridley's Foundry, Gold Hill, Nevada; Atna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

For Circulars and further information, address

THE CELEBRATED Self Generating Portable Gas Lamp.

This extraordinary Lamp produces its own gas by the vaporization of Petroleum, Naphtha, or Benzine. It emits neither smoke nor smell, and burns with a pure white flame, equal in intensity to an ordinary gas burner, and at an expense of from one to three cents per hour only, according to the quantity of light required. It is peculiarly adapted for mining purposes, also for stores, factories, billiard rooms, and, in fact, for all purposes where regular gas is not available, and for which it is an admirable substitute. As an outdoor light it stands unrivaled, burning with undiminished brilliancy in a strong wind.

Directions for Use.

Charge the reservoir with the prepared fluid, or with Benzine, from half to three-fourths full; allow a portion to run through into the cup, then turn off the tap and ignite the fluid, which will heat the burner sufficiently to generate the gas, which will be seen issuing from the top. The tap must now be turned on, and a steady light will be maintained till the whole of the contents of the reservoir is consumed.

A small needle, bent at the point and fixed in a holder, may be occasionally required to clear the minute hole through which the gas issues, and the regulating screw at the bottom turned a little back; but care must be taken not to force the screw too high, and it should never be used to extinguish the light—only turning the tap off, it will gradually go out.

When necessary to renew the cotton which is placed in the lower pipe to prevent the too rapid flow of the fluid, the lamp should be placed in a vise and the burner screwed off. The burnt cotton must then be withdrawn, and a fresh piece of stout cotton rag, one inch wide and four or five inches long, should be doubled over a piece of wire, and inserted into the pipe—the ends cut short off, the burner again screwed on with a little white lead, and the lamp is ready for use.

Manufactured solely by **JOHN J. HUCKS**, original proprietor, Factory, North Beach, San Francisco; and for sale by his agents in every city and town throughout the State. 15v14 3m-8

The American Spring Bed.

THIS BED, NOW SO POPULAR IN THE EASTERN
and Western States, was patented August, 1856. For practical utility, comfort and durability, it is unsurpassed. It is easily applied to any bedstead. It is portable, and not liable to get out of order. The price is about one-fourth that of the spring mattress. It combines elegance with cheapness and comfort. Call and see it. Mechanics' Institute Building, No. 29 Post street, San Francisco. 8v16-3m

SUBSCRIBERS who do not receive the *Mining and Scientific Press* in due time, are requested to inform the publishers.

THE LABOR EXCHANGE.—This institution is now under efficient headway, and appears to be full of business. Large numbers of mechanics and laborers are daily finding employment through its aid. Some idea of what it is doing may be learned from the fact that, between 2 o'clock p. m. on Thursday and the same hour on Friday, 115 applications for employment were registered, and 110 men found situations, between twenty and thirty of which were for mechanical employment. Mr. H. C. Bennett, has been elected the permanent secretary of the association, under whose management we have no doubt it will prove a most useful and efficient organization.

REDUCED RATES.—On and after June 3d, telegraphic messages will be sent for fifty cents from this city to Stockton or Sacramento, and for ninety cents to Virginia City. Cheap telegraphing rates are one of the necessities of the day.

MAINE INDUSTRY.—The Maine legislature at its late session, incorporated twenty-four companies to carry on various industrial enterprises, with an aggregate capital of over four and a quarter million of dollars.

DISEASES OF THE EYE.—During a late visit to San Francisco, we fell in with an old acquaintance from this county, Mr. G. W. Purdy, who formerly resided at Forrest City. About two years ago, while under treatment ourselves, we saw Mr. Purdy at the office of an oculist in that city, with eyes badly inflamed and the sight entirely lost. We saw him a few months later at another physician's, but his case was scarcely improved, and seemingly hopeless. His eyes have now entirely recovered, so that he goes about his ordinary business. From his own lips we learned that the restoration of his sight was entirely due to Dr. D. R. Morgan, whose office is at No. 627 Sacramento street, between Montgomery and Kearny, who cured him in the short space of eighteen weeks. Mr. Purdy mentioned several remarkable cures which occurred in the practice of Dr. Morgan during the time he was under treatment, among which was that of Mrs. Jane Albert, of Brownsville, Yuba County, and several others. Mrs. Albert had been afflicted with sore eyes from early childhood, and for eleven months previous to treatment she had not been able to discern light, nor had she seen the features of her youngest child, twelve months old. She had heard of the remarkable cure of Leonard P. Eder, of Marysville, and Joseph E. Haskell, of Sacramento, and determined to try Dr. Morgan. The result was that she was able, after ten days, to read ordinary newspaper print. Mr. Purdy was of course greatly rejoiced at the recovery of his sight, after so many trials and failures with different physicians.

The above is clipped from the *Mountain Messenger*, of February, 1888. 10v16 Sm

SAVE YOUR TEETH.—Mrs. Jessup & Beers, over Tucker's jewelry store, are now making a specialty of filling the fangs of dead teeth, and building up broken crowns with pure gold—thus restoring them to their original usefulness and beauty. They are also using Nitrous Oxide for the painless extraction of teeth, when so desired—the only absolutely safe anesthetic ever discovered. In breathing it, it acts as a gentle stimulant, without undue excitement, the sensation produced being truly delightful, the effect upon the lungs healthful, and in its results positively free from all danger. Prepared and administered daily at the Dental Rooms of Messrs. JESSUP & BEERS, corner Montgomery and Sutter streets, San Francisco. 10v16f

HEADQUARTERS FOR HOMESTEAD LOTS.—At Messrs. Dun can & Co's salerooms you will find maps and plans of the Folsom and Howard street lots, at \$930, in payments of \$30 per month. Lots on Eighteenth and Nineteenth streets, at \$500, in payments of \$20 per month; and lots of the City Land Association, at \$90, in payments of \$4 per month.

SAN FRANCISCO.

Patent Cases of every kind conducted. Attention given to Re-issues, Extensions, Interferences, Rejections, Appeals, etc., etc.

ASSIGNMENTS, POWERS OF ATTORNEY, AND LETTERS OF ADVICE CAREFULLY PREPARED.

ENGRAVINGS FINELY EXECUTED.

COPIES OF PATENT PAPERS,
Issued by the United States or Foreign Countries, procured in the shortest time possible.

Generous Compliments.

The following is a sample of the generous acknowledgments which we frequently receive. We can only return thank for such gentlemanly obligations, and assure our friends of our best endeavors to merit their respect and kindness:

GEORGETOWN, January 22, '87.
Messrs. Dewey & Co.—Sirs: I have the honor to acknowledge receipt of your letter of the 21st instant, transmitting to me "Letters Patent" on my application through you for an "Improved Machine for Washing Ores." It came to hand safely, and I am pleased to tender you my grateful acknowledgments for your success on my behalf. Very truly yours,
M. A. WOODSIDE.

By MAIL.—The Mining and Scientific Press will be sent by mail to any part of the civilized world. In case of removal subscribers have only to inform us of the post office address of their old and new location, and the paper will be sent accordingly.

A. T. DEWEY. O. W. M. SMITH. W. B. EWER.

THE BEST IN AMERICA.

The Mining and Scientific Press,

Is the Largest and Best MINING AND MECHANICAL Newspaper Issued in the United States.

DEWEY & CO.,

Patent Agents, Publishers, Book and Job Printers, 505 Clay Street, San Francisco.

THE MINING AND SCIENTIFIC PRESS is published every Saturday. Each issue comprises sixteen pages (64 columns), and furnishes more valuable reading matter than any other weekly journal in California.

To the practical mechanic, metallurgist, prospector, millman, mine holder or worker, it is worth many times its subscription price. Its files contain a record of the improvements in mining machinery, the progress and development of the mines, and all new methods and processes for working and

SAVING PRECIOUS METALS.

All progressive information, in fact, transpiring with the times—which cannot be obtained from books.

The MINING AND SCIENTIFIC PRESS is now in its SIXTEENTH VOLUME, and enjoys a large circulation. It received the following hearty endorsement of the California Miners' State Convention, held at Sacramento, January 17th, 1886:

RESOLVED, That we regard a mining paper or journal of great importance to the mining interests of California, and recommend the MINING AND SCIENTIFIC PRESS, of San Francisco, to the consideration and support of the miners of the Pacific coast.

Terms of Subscription.—One year, \$5; six months, \$3—in advance. Send for sample copies. Remittances may be made by mail at our risk, if parties sending will register their letters, or send money order.

As AN ADVERTISING MEDIUM throughout the whole Pacific States and Territories, the Press is unsurpassed. Rates moderate.

SPECIMEN NUMBERS of the Press and Patent Circulars, sent free.

DEWEY & CO.,

San Francisco

Jan. 1st, 1883.

California Labor and Employment Exchange
319 Battery Street, San Francisco.

MINING COMPANIES, MANUFACTURERS, CONTRACTORS, and employers of all descriptions of labor, are requested to send their orders to the Exchange at once.
19v16-3m H. C. BENNETT, Secretary.

POSTMASTERS are requested to punctually inform us of the removal of subscribers of the Press from their locality, or of neglect to take the paper out of the office from any cause—when the subscriber omits that duty himself. It is not our intention to send this journal to any party longer than it is desired. If we inadvertently do so, subscribers and others will please inform us.

W. T. GARRATT,
City
BRASS AND BELL FOUNDER.

Cor. Mission and Fremont sts.,
SAN FRANCISCO.

Manufacturer of Brass, Zinc, and Anti-Friction or Babbet Metal Castings:
CHURCH AND STEAMBOAT

BELLS,

TAVERN AND HAND BELLS AND GONGS,

FIRE ENGINES, FORCE AND LIFT PUMPS,

Steam, Liqueur, Soda Oil, Water and Flange Cocks, and Valves of all descriptions, made and repaired. Hose and all other Joints, Speller, Solder, and Copper Rivets, ac. Gauge Cocks, Cylinder Cocks, Oil Globes, Steam Whistles.

HYDRAULIC PIPES AND NOZZELS

For Mining purposes, Iron Steam Pipe furnished with Flanges, &c. Coupling Joints of all sizes. Particular attention paid to Distillery Work. Manufacturer of "Garratt's Patent Improved Journal Metal."

Best Highest Market price paid for OLD BELLS, COPPER AND BRASS. 6f

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1865, furnishes advanced instruction in the various branches of Mathematics, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING. 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, \$125 per year of forty weeks. The Libraries, Museums, Laboratories and Apparatus, accessible to students, are various and expensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-ly16p

San Francisco Market Rates.
San Francisco Mining Share-
holders' Directory.

A WHEEL WITHIN A WHEEL.—Our "occasional jokist" sends us the following. We wish it to be understood, however, that we do not, as a general thing, approve of this flippant style of treating serious subjects; but as our correspondent is a valued one, we give his note "just this once."

"EDS. PRESS:—The *Scientific American*, with an eye to the "main chance,"—which is of course very proper,—generously proposes to publish, for the benefit of those who wish to farther discuss the wheel question, a monthly periodical, entitled "THE WHEEL." All correspondents are to remit, with their communications, a sufficient amount of cash to pay for "setting up" their articles—say \$2.50,—or at that rate per page;—diagrams being at a separate charge,—say from one to three dollars. The aforesaid journal is of course, to make all it can, by the sale of the publication at twenty-five cents per copy;—which, considering that it costs nothing, being paid for by the contributors,—is likely to prove a very neat little speculation. The *Sci. Am.*'s "head is level," after all. Yours, JONES.

THE LABOR EXCHANGE continues to work most satisfactorily. The Secretary, Mr. H. C. Bennett, is constantly employed, and finds himself called upon to keep up a most voluminous correspondence with every part of the State. None but one of untiring energy and rapid, off-hand way of doing business and conducting correspondence, could get along with the arduous duties of such an office; especially in its incipency, when the routine of business has to be gradually wrought out, and the public schooled into its manner of working. Mr. Bennett is just the man for such a position—the right man in the right place.

During the week ending at 2 o'clock yesterday, 400 men have obtained employment through the aid of this association—of whom 172 were laborers; 44 farm hands; 16 teamsters; 25 lumbermen, and 143 other trades. The wages generally offered for country laborers is about \$30 per month and board; for harvest work, \$40 to \$50 and found; artisans from \$3 to \$4 per day—all in gold. Farming help for the interior is much sought for, and the supply of able-bodied men for such work is deficient.

The Hick's Engine.

This engine, which was invented by Mr. William Hicks, was first patented in the United States, February 21st, 1865, and a subsequent patent taken out May 22d, 1866. It has also been patented in nearly all the important countries of Europe and their dependencies. It was first exhibited on this coast by the proprietors of the Miners' Foundry, at the last State Fair in Sacra-

but not lettered, in the longitudinal opening between A and B. The cylinder on the right hand receives its steam from A; and the one on the left from B—each receiving its steam through its companion cylinder. Fig. 5 represents the pistons, connecting rods, crank shaft and connections; which, when put together, rest in the box shown in the center of fig. 2.

An important improvement has been

Fig. 2.

Fig. 3.

Fig. 4.

Fig. 5.

mento. We have several times spoken of the engine, but have not been able, until the present time, to give an illustrated description of its construction.

Referring to the figures annexed, fig. 2 represents a view of the main casting of the engine, with the box in the center and the bearings for the main shaft. Fig. 3 represents the same casting viewed at right angles with its position in fig. 2. Fig. 4 is a transverse section of the same through the centers of the cylinders; A and B are the supply pipes, the exhaust being seen,

introduced at the Miners' Foundry, in the construction of the crank shaft. Instead of making it with disks, as shown in fig. 5, they now forge it out from a single bar of iron, thereby producing a much stronger shaft than can possibly be made with disks, by the employment of the same weight of metal.

The Hick's engine thus consists of four cylinders, disposed in pairs, two at each end of the casting, their axis being parallel. The crank shaft lies across the casting in the center between the pairs of cylinders, and

at right angles to them, as shown in detail, in fig. 5. The pistons, fig. 5, which receive steam on one end only, are formed of two annular rings or cylinders in one casting, with divisions, so as to divide the space between the rings into steam passages. Each piston has three steam passages, two of which form part of the steam and exhaust pipe, as well as acting as slide valve for the cylinder alongside; the third steam passage receives the steam at the commencement of the stroke and up to the point at which it is cut off, through ports in the division between the two cylinders, from the piston alongside, and passes it out again at the end of the stroke. Around each cylinder, midway of the stroke, are a number of openings, A, A, fig. 3, two of which, in each cylinder, communicate externally with the steam and exhaust pipe; and the other openings, not shown, four in number, pass directly through from one cylinder to the other. These openings are so arranged that the openings into the steam passages in the pistons A, A, fig. 5, pass over them, while the engine is in motion, and the openings in the pistons so disposed, that communication is open to allow the steam to pass to and from the cylinders at the right time. The wrist pins for the connecting rods pass through the center of the pistons, at right angles to the axes of the same, and the connecting rods of opposite cylinders are secured together on the wrist pin of the crank shaft, the details of which are shown at N, fig. 5, so as to form but one bearing for both rods. The entire part of the main casting forms a box on which is secured a cover, inclosing the whole of the working parts.

BLAKE'S STONE BREAKER.—In our issue of March 28th, we gave a clipping from a New Haven paper, announcing the decision in the U. S. Circuit Court at Hartford, Conn., in the case of Eli W. Blake vs. Charles W. Stafford for infringement of patent on the above named machine. The New York *Wall Street Journal* gives the decision in full, as rendered by Judge Shipman; and also the decision in the case of Blake and Marsden vs. Archer, for a similar infringement, as rendered in London by Vice Chancellor Sir W. Page Wood, in November last. Both decisions are elaborate and conclusive; fully sustaining the validity of the Blake patent, and settling the question in reference to all cases where "upright convergent jaws actuated by a revolving shaft" are used for stone breaking or crushing. Blake Brothers announce their full determination to protect their patents in future, whatever the expense may be. Both decisions are on file at our Patent Agency.

ACTION OF NAPHTHALINE ON INSECTS.—M. Eugene Pelouze has found that naphthaline prevents plants from being attacked by insects. Its effect is not to kill either one or the other, but a very small quantity is sufficient to effectually drive the insects from the plant, and he believes that in this substance, florists and agriculturists will find a very serviceable friend.

Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

Formation, Distribution and Age of Igneous Rocks.

[Continued from page 300.]

The formation of the Quail Hill mine, lately described by W. A. Goodyear in the columns of the MINING AND SCIENTIFIC PRESS, seems to be possessed of considerable scientific interest, as it has a bearing upon the age of the more ancient auriferous deposits of the Sierra Nevada. I am informed by Mr. C. E. Treadwell, that some of the gold found in the Quail Hill mine is quite coarse, some pieces weighing \$10 and \$12. The gold from this mine has every appearance of being placer gold, such as is usually found in ravines, partially rounded by attrition. Mr. Treadwell also thinks the mass of rock composing the mine is unquestionably a stratified deposit. If this repository of the precious metal is, as it appears, really an ancient stratified placer, it dates the beginning of the eruptive era of the precious metals back to the period of the folding of the slates, while the floor of granite, upon which the system of stratified rocks rests, was yet plastic. When we consider the high dip which prevails among the schistose rocks of the Sierra, it must appear evident that the solid crust could have been, at most, but a few miles in thickness, during the folding of the slates. I had supposed, until recently, that all auriferous deposits rested unconformably upon the slates, and, consequently, was led to believe that some miles in thickness of the underlying granite had become solid at the opening of the eruptive era of the precious metals. The Quail Hill deposit conforms with the slates which dip at an angle of about 80°, and it must have been formed near the close of the extended period, during which the slates were tilted up edgewise.

Mr. Goodyear says, "the great mass of auriferous slates which forms the western flank of the Sierra Nevada, dip towards the granite axis of the chain, instead of from it, as would seem more natural. This condition of things is similar to that so often observed in the Alps, which is known as the 'fan structure,' and has so much perplexed geologists." When geologists recognize that the granite which shows upon the surface is *vein rock*, and that it was intruded, along anticlinal lines, in a plastic state, during the folding of the early-formed slates, they will be no longer perplexed to find the slates dipping towards the granite. I have observed many veins of granite among the slates; one in particular, situated in Butte County, which is miles in length, and varies from a few feet to two or three hundred yards in width. Where it crosses the North Honcut, it is not over twenty feet in width, and contains a "horse" of the country rock, which is of a slaty structure, and stands nearly vertical.

I am informed that Mr. Goodyear is a young man of good education and fair ability, as his papers show; and although he seems strongly inclined to follow his teachers, his head is not so filled with their false theories as to materially affect his eyesight. Keep on using your eyes, Mr. Goodyear; throw aside theories; take into the field with you only such facts as you know to be well ascertained, and continue your investigations,—for physical and chemical geology hardly take rank as science.

Inasmuch as the position which the advocates of the sedimentary origin of metal-bearing quartz veins find it necessary to assume, implies just what I contend for, viz., an eruptive era of the metals, we have only to consider if it is the more probable that the precious metals were erupted and intruded in the gangue in which they are found. There is but one compound of silicon with oxygen known to

chemists, viz., silica; and this is formed only by the ignition of silicon with oxygen. Quartz is soluble in water, it is true; but only after first being, or having been, fused with the alkalis. Sulphurets may be artificially produced by the ignition of the metals with sulphur, and the alloys of the precious metals which are also found in quartz, may be formed by fusion. These operations are neither delicate or intricate; but might have been performed in nature on the grandest scale, when the elements combined at an elevated temperature, and aggregated to form the solid earth. And we find in the intrusive veins, native metals, alloys, sulphurets, etc., which are the product of igneous fusion, mechanically mixed with and inclosed in solid quartz, which is itself the product of the ignition of its elements, in every conceivable proportion.

In regard to the rock matter forming the more ancient stratified auriferous deposits, we may apply the same mode of reasoning as that adopted by geologists for determining the origin of the stratified rocks. David Page, in his "Elements of Geology," says: "Gneiss, or the oldest system of the stratified rocks, differs little from true granite in its mineral composition, except in as far as the aggregation of simple minerals. In granite, the crystals of feldspar, quartz, mica, and hornblende, are entire and distinct; in gneiss, their angles and faces are broken and water-worn. In granite, there are no traces of laminated or stratified structure; in gneiss, this structure is evident, even where the strata are most indurated and contorted. All this attests the aqueous origin of gneiss—that it must have been deposited in water, and that it is composed of the disintegrated minerals of unstratified granite."

So we may say some of the ancient auriferous deposits differ little from true metal-bearing quartz, except in as far as regards the aggregation of the metals in strata. In quartz, the crystal of quartz, native metals, sulphurets, etc., are entire and distinct; in the ancient deposit their angles and faces are rounded and water-worn. In quartz there are no traces of laminated or stratified structure; in the old deposit this structure is evident. The miners sometimes find in the most ancient deposits, huge unaltered quartz boulders 20 feet or more across, and sometimes quartz boulders, tons in weight, and rich in gold. And moreover some of these deposits, though evidently formed by running water, are composed entirely of quartz gravel. All this attests the origin of the mineral and metallic matter composing the more ancient auriferous deposits, and that it is composed of the disintegrated mineral and metals of the unstratified quartz. And we may further conclude that the more ancient auriferous deposits of the Sierra Nevada, belong to and are a part of the old red sandstone system. It is no objection that they are mostly composed of loose gravel. They are unquestionably, fresh water deposits, and those flanking the summit have not been submerged since their deposition. The drainage of most of them is quite perfect, so that all the soluble mineral matter has been carried down to the sea. In some localities, however, where the drainage was not complete, there is an indurated conglomerate, termed "cement" by the miners, which is quite as solid as the original quartz. After once comprehending the plan of the distribution of igneous rocks, one cannot contemplate the more ancient auriferous deposits in place, and doubt an eruptive era of metalliferous quartz, or that it occurred during the old red sandstone era. F. A. HERRING.

ILLINOIS IRON MANUFACTURE.—A company has been organized in Chicago, with a capital of \$250,000, for the manufacture of pig iron from Lake Superior ore. The basis of the enterprise is the coal found at Brazil, Clay county, Indiana, on the line of the Terre Haute and Indianapolis Railroad. Until a recent date, it was not known that this coal would answer the purpose; but the matter has been definitely determined by the erection of three blast furnaces at Brazil, by Chicago parties, which have been in successful operation about three months. It is the intention of the company to erect immediately two blast furnaces, of the capacity of thirty tons each per day. The Chicago Times says: "While Chicago, and through Chicago, the whole northwest, are heavy consumers of iron, not a ton of pig iron has ever been manufactured in the city. It is certain that Lake Superior ore can be delivered in Chicago, via Escanaba, at least \$1 per ton less than either at Detroit or Cleveland. With so many advantages, there is no reason why Chicago should not become one of the first iron manufacturing cities in the country."

[Written for the Mining and Scientific Press.]
Letter from Cerro Gordo.

EDITORS MINING AND SCIENTIFIC PRESS: As much is being said about the mines in this vicinity, it should be understood that what is now needed at Cerro Gordo is not a rush of laboring men, but an influx of capital. It is hardly likely that very extensive operations will be carried on this summer, though matters are progressing favorably. Several men of means have visited these mines this spring, and I know of none who have gone away without either taking hold of something immediately, or expressing an intention to return soon.

Dr. Delavan, who has stuck to business through all the hardships of winter, intensified as they were by our wretched means communication with the world,—facetiously called "mail facilities,"—with exemplary perseverance, is still in the mines. As I once stated that his furnace was a failure, it gives me pleasure now to say that it is a success,—metallurgically at least,—under the management of a French gentleman, who has had much experience in smelting in Mexico, and who is putting up large works on his own account at present.

Several other parties are going to put up smelting works of considerable magnitude this season, so that there will probably be a good deal of activity towards fall. A large proportion of the ores could be amalgamated to great advantage, if carried to some place where water is abundant, as Owen's River for instance. In the mines, water is so scarce as to preclude all possibility of treating ore by its means, unless a much greater supply can be obtained, of which I fear there is little hope, notwithstanding many cite Virginia as an encouraging example; but I think there is great difference in the conditions. According to the estimates at present made, smelting will cost about \$80 per ton for custom work.

Among the interesting minerals of this region I find an aluminite of lead, in beautiful transparent prisms, which strike a fine blue with nitrate of cobalt. The name of the placer gold mines spoken of in your issue of 11th inst., is *Alabama*, not "*Albambra*." I am told the miners are making good wages there now, and a second water ditch will soon be completed, but it is not likely that the mines will prove extensive. About a dozen men are at work.

At Coso, about fifty miles southeast from here, there are seventeen arastras working on gold quartz, which pays, I am told, from \$50 per ton and upward. There are placer diggings also, but not much water to work them. The paying veins are very small. In the Kearsarge district the Silver Sprout Co. is putting up a roasting furnace with which to treat their ores, as I told them a year ago they would have to do.

The Kearsarge Co. works away at the mine. The arastra mill at Bend City is doing well, and on the whole the prospects of the valley are good. C. H. A.
Lone Pine, April 22d, 1868.

TREATMENT OF POOR COPPER ORES.—Mr. Wm. Henderson, of the St. Rolox Chemical Works, Glasgow, has taken out a patent for a process for working poor copper ores. His claim is for separating and mixing his ores that the proportion between the copper to be extracted and the sulphur combined with it, shall bear all times constant. In the preliminary calcination of the pyrites he makes such an admixture as shall leave him, in the burnt ore, from one to one and a half times as much sulphur as the metal to be extracted; thus, if the pyrites have two per cent. copper, it must have three per cent. sulphur, and so on for other percentages. In the further treatment of this prepared ore, from 10 to 20 per cent. of salt is mixed with it, and the mass is then calcined in closed calcining furnaces or muffles, which converts the whole of the copper into soluble and volatile chlorides. The former are washed out of the ore, and the latter caught in a condenser filled with coke. Mr. Henderson states that the main feature of his process, and the one which has established its practical success, is the regulation of the proportion of sulphur to that of the copper in the ore as 1½ to 1 as a maximum. In this proportion the mutual decomposition of the salt and sulphuretted copper takes place so rapidly and so completely that the calcination is effected in six hours, and can be conducted at a dull red heat.—*London Mining Journal*.

The Utilization of Air.

We give below a brief synopsis of the paper read by Mr. R. d'Heureuse, at the last meeting of the Academy of Sciences of this city, and to which brief reference was made in our issue of last week:

It is a matter of surprise that the action of air in industrial pursuits is so frequently lost sight of, and so imperfectly recognized even in cases where its beneficial action is fully recognized. It is only quite recently that the action of air, in extensive application to industrial pursuits, has been brought prominently before the world, and even now improvements in this direction are progressing very slowly.

We all remember the first application of the Bessemer process to manufacture of steel, and the objections and condemnations which followed its announcement. It is now universally acknowledged as the only rational mode of expelling the excess of carbon and other impurities from iron. This process expresses a principle which may be expressed as follows:

"Where, from certain substances such parts are to be eliminated, which more readily combine with the oxygen of the air than does the substance whose purification is required, it is only necessary to bring every particle of the whole substance into as intimate contact as possible with the oxygen of the air—other favorable conditions being insured."

The most ready and intimate contact to be obtained to this end, is by impelling the gas into the substance, which, if a solid, must of course be properly prepared for such operation by pulverization or fusion. Mr. d'H. would apply this principle to the roasting of ores. The horizontal revolving cylinder roaster, is one mode of this application.

The application of air to the preservation of organic substances was briefly alluded to. The principle is deserving of still more consideration, especially by scientific men. It is capable of large application to fluids, in cellular structure. Water soon becomes foul, unless it is freely subjected to oxygen by agitation in open air or otherwise, so that the organic substance which it contains may be readily oxidized. The principle herein involved is vitiated in the treatment of fluids subject to and under fermentation, when such fluids are deprived of free access of air. The admission of a limited quantity of air during fermentation, and that only to the surface, is all wrong, and gives but imperfect results; and leaves the fluids in a condition injurious to their stability. It is working against nature. We should either totally expel and exclude air, or we should give them an unlimited quantity.

Leibiz perfectly understood the action of air on fluids; but it never occurred to him that a better action could be had than a mere surface contact. Air in such cases should be impelled. The principle admits of a vast multitude of improvements through almost all our industrial pursuits. The march of progress in this direction is onward. Its use with our food and drink is but partially recognized as yet. Experiments by medical men in the direct introduction of air into the stomach or intestines, in certain diseases,—especially those of a putrifying nature,—will, no doubt, eventually develop eminently useful facts. The introduction of tempered or medicated air into the lungs has already been proven of high value in saving life. Other parts of the human system may be subjected to a similar treatment in modified forms.

The paper was referred to the publication committee.

UNDERGROUND TELEGRAPH.—The system of underground telegraph lines insulated with an asphalt compound, noticed so favorably in the Paris Exposition, has lately been tried with highly satisfactory results by the Royal Engineers in the yard of the Brompton Barracks at Chatham, England. This system, the invention of Mr. Donald Nicol, consists in laying down a series of rigid sections, or rods of asphalt containing the wires, in trenches in the earth, as lengths of iron gas pipe are laid. These sections are in about twelve feet lengths, the conducting wires protruding at the ends, and being alternately left straight and twisted into "cork-screws." In planting the lines, the straight ends of one section are pushed into the "cork-screw" of the next, and so on. The blow of a hammer upon the "cork-screws" ensures perfect contact, and when the junction is filled in with melted asphalt perfect insulation is also effected. In this way a dozen joints may be insulated at once. The cost of laying is \$100 per mile.—*N. Y. Stockholder*.

Mechanical.

AMERICAN IMPROVEMENT UPON THE BESSEMER PROCESS.—John F. Bennett, of Pittsburgh, Pa., has patented an improvement upon the pneumatic process, by which the sulphur and phosphorus are eliminated from the iron while it is yet in the converter; whereas their removal ordinarily requires a subsequent and distinct operation. The peculiarity of the process consists in the employment of carbonic acid gas. After the decarbonization is nearly completed by the blast of atmospheric air in the usual manner, a blast of carbonic acid gas is substituted for it, for a moment, and this is followed by the air blast again for a few seconds. He thus explains the operation:

"The blast of atmospheric air being continued through the molten iron until nearly all trace of carbon has disappeared, on the introduction of the carbonic acid gas a chemical union is formed between the two equivalents of oxygen and the sulphur present in the iron, forming sulphurous acid, which passes off as gas, depositing the carbon thus set free, which may be expressed thus: $C O_2 + S = S O_2 + C$. A similar result takes place in respect to phosphorus present as an impurity in the iron; the oxygen of the carbonic acid combines with the phosphorus, evolving acid gases of phosphorus, and depositing carbon, thus, $2 C O_2 + P = P O_4 + 2 C$, and carbon is deposited. This deposit of free carbon may be left in the iron, if preferred, in the manufacture of steel, or it may be burned out after the sulphur and phosphorus are removed, by a repetition of the atmospheric blast for a few seconds, as before stated. The oxygen of the carbonic acid gas will also combine with the iron, forming ferrous acid, thus, $C O_2 + F = 2 F O + C$, the formation of the protoxide of iron setting free and depositing the carbon."

The plan is described in full in the *Scientific American*.

STEAM HAMMERS.—The following points are from *The Engineer*: Steam hammers usually fail by the breaking of the hammer-head, the piston-rod, or the piston itself. So long as the blow is delivered directly, the hammer-head seldom breaks; but in those hammers with large faces, forging masses of considerable superficial area, the blow is often delivered to the right or left of the center of the anvil, and a twisting strain is caused which results in the fracture of the hammer face or slide-block. It is not easy to suggest a remedy. The best plan seems to be the use of ribbing, the ribs being disposed on the slide block in such a way that the cross strains may be resisted, as by a cantilever girder; and we need hardly point out the importance of distributing the weight of the head as much as possible.

The piston-rod appears to give way solely as the result of molecular deterioration. The fracture is invariably crystalline, and the metal brittle. It is certain that a perfectly fibrous tough bar of iron may be converted into a crystalline brittle bar by a few months' or even weeks' use, as the piston-rod of a steam hammer. In fact, it is impossible to get any rod to stand when the connections of the piston and the hammer head to it are rigid and direct. A cushion of hard wood between the slide-block and the piston-rod, or between the latter and the piston, is therefore used.

Pistons give way because their own momentum tends to carry them down after the rod has been brought to rest; the rod, in fact, is driven through them. The remedy consists not in increasing their weight, but in reducing it as far as possible, and thus imparting a certain amount of elasticity.

OIL-TESTER.—The new oil-tester of Ingram and Stappers is said to be rapidly superseding all others, being based, not on specific gravity, like most of them, but upon what is plainly the true principle, viz., friction. According to this test that oil is best, which will allow the greatest number of revolutions in a shaft, with the least increase of temperature in the bearings.

NEW ZEALAND IRON-SAND.—Messrs. Greener and Ellis, of Darlington,—says the *London Mining Journal*,—have patented the application of this sand to the manufacture of a good fettling, which has the further advantage of improving the quality of the iron made in the furnace in which it is used. The mode of using it is as follows: "It is thrown on the bottom of the heating or mill furnace to the depth of two or three inches; a dry bottom is thus formed of material that does not act injuriously upon the iron, and is used in lieu of the sand or cinder ordinarily employed. The furnace is charged and the heat applied in the manner usual in working reverberatory furnaces. A hollow or well may be made in the throat or flue of the furnace, commencing as far in the throat as possible, and extending into the neck. The well should be capable of holding the quantity of melted ore from the material thrown on the bottom of the furnace, as well as the cinder from the heated iron for one or two heats, for it is found that in some cases the longer the substance employed is exposed to heat the better it will suit the purpose which it is intended to effect. The molten mass may be kept in the well for one or two hours, then tapped, or it may be allowed to run continuously in the same manner as it is now run from sand bottoms; it may run into a small iron wagon or other suitable receptacle, and be allowed to cool previous to being used. By this method all the rich cinder from the iron, which is now mixed with melted silica or other impurities in the heating furnace, will be preserved and mixed with the melted ore which runs from the bottom; the mixture forming a pure and valuable "fettling."

MILL PICKS.—Isaac B. Hymor gives the following directions for the making of mill picks, as the result of long experience: In the first place, get double refined cast steel made expressly for mill picks. Be careful in drawing out the pick not to heat the steel higher than a cherry red. Use an anvil and hammer with smooth faces. When finishing the pick do not strike it on the edge, but hammer the pick on the flat side, striking light and often, until the steel is quite dark, letting the blows fall so as to close the pores of the steel. If the last blows strike the edge of the steel, the pick will fly and "spall" off. When a dozen picks are ready to temper, get two gallons of rain water, from which the chill should be taken if in winter, by dipping a hot iron in it; add two pounds of salt, which dissolve, and your bath is complete. Heat your picks gradually from the center, and let the heat run to the point, and when it is a dark cherry red, dip the point of the pick vertically into the bath and hold it still, not moving it about to find a cool place. When the heat has left the part immersed, take it out and cool the balance of the pick in ordinary water used in the shop. This process should be repeated on the other end of the pick. When taken out of the tempering bath the pick will look silvery white. The use of the salt is to clean the scale from the steel and make it tough. With the edge made by this process the pick will cut clean, clear, and fine, such a cut as millers need for "cracking."

The whole secret is in the beating and hammering. If not hammered enough the steel will spall off, and if heated too hot it will crumble.—*Scientific American*.

PENDULUM ENGINE.—A Milward's patent oscillator engine was exhibited at a recent meeting of the Polytechnic Association. This engine was of two-horse power and weighed 195 pounds. The cylinder was four inches in diameter and with four-inch stroke. Instead of being suspended on trunnions, as is usual in oscillator engines, it was hung by an extension at the top of the cylinder and moved like a pendulum at each revolution of the fly-wheel. The cylinder being supported on knife edges of tempered steel it is exempt from any great amount of friction or wear at that point. The steam chest is placed on the upper end of the cylinder, and a long port conducts the steam to the under side of the piston. By means of an eccentric attached to the end of the crank of the fly-wheel shaft, motion is so given to the slide-valve that a lap and lead is obtained. Much discussion followed the exhibition of this engine. Some persons declared the term oscillator to be a misnomer, as it was properly a pendulum engine. The valve motion embracing lap and lead was declared new in this form of engine, and the absence of trunnions, which are generally heated by the steam in a manner detrimental, was an improvement. The pivot or knife edges on which the cylinder was suspended were declared good by some, while others doubted their real utility.

Scientific Miscellany.

Electric Piles in Sea Water.

We alluded last week to the researches of M. Emile Duchemin, who has been for some years experimenting in this direction. This gentleman substituted a charcoal cylinder for the copper, in the pile, with a plate of zinc suspended within; the whole being connected by a wooden cross-piece, and buoyed in a sea-basin by cork floats. Sparks could be produced, and an electrical bell was rung for two months without cessation, until the arrangement was accidentally destroyed. M. Duchemin was a few months ago summoned by the French Government to Cherbourg, to assist the Commission now occupied in experimentation upon the subject. The *Engineer* says:

"M. Duchemin has succeeded in convincing the French Government that the destructive action of sea water on metals may be made to produce electrical currents for useful purposes, and experiments are now being carried on to test the subject at the cost of the Marine Department. An experiment has been made before the President of the Marine Council of Works, with three elements—each about the size of a man's hat,—plunged in sea water, at Paris, and sufficient electricity was produced to keep a Ruhmkorff coil of 16 in. in action, and produce sparks of two-fifths of an inch in length. At Cherbourg, the currents of seven elements plunged in the sea, after having traversed more than a hundred miles of copper wire, made a needle deviate eight degrees.

The Cherbourg commission entered upon another kind of experiment to ascertain whether these marine piles would not protect iron from oxidation. When an iron plate, of which the surface has been cleaned, was placed in connection with the positive pole, it soon became completely oxidized; but it remained unaffected when attached to the negative pole. Seven elements of 16 in. in circumference sufficed to protect an iron plate having a superficies of several square yards, for an entire year; and at the end of that period the elements themselves were in good working order. The experiments made, tend to show that the zinc employed in his marine piles is capable of preserving from oxidation a surface of iron equal to eighteen times its own; but as the chemical effect depends on the number of pairs, M. Duchemin believes that a much higher result still is to be obtained,—the commission having at present employed but a very small number of elements.

How (asks M. Duchemin) is the different action of the two poles on iron to be explained? The oxygen obtained by electrical action on water, possesses energetic principles for oxidizing metals; the hydrogen produced in like manner possesses the contrary power, which, however, is not evinced by hydrogen prepared in the usual manner. A current of ordinary hydrogen passes through a weak solution of perchloride of iron containing a small quantity of ferrocyanide of potassium, without producing any effect; while a current of hydrogen produced from sea water, produces a deposit of Prussian blue."

M. Duchemin says that to protect the plates of iron-clads in harbor from rust, it is only necessary to insure communication between every part of the armor and the negative pole of a powerful pile placed in the basin. He proposes also to effect the cleaning of ships' bottoms, by connecting one pole of a Ruhmkorff coil with the iron plating, and the other with the sea,—which causes the mollusks to quit their hold.

GALLIC AND TANNIC ACID.—Löwe has found that gallic acid in solution is converted into tannic acid under the oxidizing influence of nitrate of silver. The oxidation is more complete if a salt of gallic acid is employed. The transformation of tannin into gallic acid has never been satisfactorily accounted for. Some have attributed it to the action of the atmosphere, others to the preëxistence of a soluble ferment. M. Van Tieghem's memoir to the French Academy of Sciences describes experiments which prove both views untenable. He takes the ground that tannin undergoes metamorphosis by the development of a species of fungus in the solution. The atmospheric gases alone effect no change, but the atmosphere carries to the solution spores which require oxygen for their germination.

GALVANIC DEPOSITION OF IRON.—Dr Varrentrapp, a German chemist, has come to the conclusion that there are no reasons why deposits of almost any thickness of metal in cohesive coats may not be obtained from solutions of iron by means of the galvanic current with as great facility as from those of copper, with proper care in regard to certain points. "From a watery solution of iron in which a plate of metallic iron—serving as, and connected with the copper cylinder of a simple Daniell element,—and the plate to receive the deposit, connected with the zinc cylinder,—are immersed, a coating, though thin, will be obtained; but it will remain so, and usually there will very soon set in a strong evolution of gas. In order to avoid this, it is sufficient to insert in the current close to the iron plate a spiral of iron wire, thus enlarging the surface of this metal as compared to that of the one which is to receive the coating; and upon this change the process will go on for days in perfect regularity. The iron coating has the tendency of forming warty aggregations near the edges; it is exceedingly brittle, and of a hardness resembling non-hardened steel under the file. After passing the fire, however, it becomes soft and flexible, and may be rolled into a narrow cylinder.

Metallic types and blocks are readily coated in this manner,—as much so as with deposits of copper; they may be easily separated by having a previous coating of silver, which has been allowed to become yellow in an atmosphere of sulphureted hydrogen,—but which must not be too heavy, since in that case it would cause the iron coating to become loose and reflexed—as soon as it acquires about the thickness of paper."

The above is condensed from *Dingler's Journal*.

CHEMICAL ACTION OF LIGHT.—Professor Roscoe, of Manchester, exhibits the different degrees in which red and blue media transmit the chemical rays, in the following manner: He fills a thin glass bulb with a mixture of hydrogen and chlorine gases, produced by the decomposition of hydrochloric acid by means of the voltaic current; and the room being darkened, places this bulb in a lantern having one side of red, and another of blue glass. A flash of light rich in chemical rays, is produced in front of the lantern by igniting a mixture of nitric oxide and bisulphide of carbon. If this light is received only upon the red glass,—the blue being covered,—no effect is produced upon the bulb within,—the glass absorbing the chemical rays; but if the red side is covered, allowing the blue glass to transmit the rays, there is a sudden union of the gases in the bulb, and an explosion is the result.

POTASSIUM AND SODIUM.—M. Eugene Peligot has found that, contrary to the general belief, sodium is rare in the vegetable kingdom. He found no trace of the salts of this metal, except in a few plants of the class *Chenopodiaceæ*. He considers this fact due to an indifference on the part of plants to chloride of sodium, on account of the difficulty with which that compound enters into new combinations. Even marine plants, although living in a medium in which the soda salts predominate largely over those of potash, contain more of the latter than of the former. To those who ask how it is possible that so many chemists could have been wrong in mentioning soda in their analyses of vegetable ashes, M. Peligot replies, that it is probable that finding evidence of the presence of another base besides potash, they have assumed it to be soda, without sufficient examination. According to him, it is generally magnesia.

PHOTOGRAPHIC BATH.—The permanganate of potash seems to have the property of so modifying old photographic baths,—that they are completely cured of "fogging." Mr. J. R. Johnson says that a few drops of a 20-grain solution of the pure article is to be added to the bath. It is thereby changed in color to purple, and then turbid brown; but on filtration becomes perfectly clear.

New Patents and Inventions.

Under this heading we shall mention, from week to week as occasion may demand, New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

PATENTS RECENTLY ISSUED.

76,461.—IMPROVED ORE CRUSHER AND GRINDER.—Seymour Hughes, San Francisco, Cal.:

I claim an ore crusher, having the spiral inclined planes B, B, together with the stamps U, and dies E, the whole constructed and operating substantially as and for the purpose described.

2. In a circular crusher and grinder, I claim the inclined planes, consisting of the reversible grinding plate *b*, and the adjusting plates *a, a*, substantially as and for the purposes described.

This invention relates to a new mode of constructing quartz mills. Mr. Hughes constructs his mill so that the stamps themselves are carried around on a circular base, the floor of which consists of a series of inclined planes, each having a die at its base. The stamps are raised by being moved up the planes, the blow being produced by the fall of the stamp from the top of one plane to the foot of the next succeeding one, where it is received upon a die, as in the ordinary battery. Screens are placed around the outer circumference of the apparatus, through which the pulverized ore passes. This invention was fully described, with illustration, in our issue of Feb. 15th, 1868.

76,587.—GUN LOCK.—Salmon Belden and John F. Crabtree, Visalia, Cal.

I claim 1. The lever F, having a short arm connected with the tumbler by a link, and a long arm, to be held by the trigger when at full cock, and released when the trigger is drawn for discharge, substantially as described.

2. The safety-catch, consisting of the lever n, spring p, and lever r, together with the notch o, shoulder u, and the pin v, the whole combined and operating substantially as and for the purpose described.

76,721.—IMPROVEMENT IN SHINGLE MACHINES.—J. P. W. Davis, Point Arena, Cal.:

I claim the combination and arrangement of the clamps H, H, for holding the shingle, the curved pivoted knives I, I, and the wedge b, for graduating the distance between the edges of the same for tapering the shingles substantially as described.

2. The combination and arrangement of the rod K, and lever M, for releasing and delivering the finished shingles, substantially as described.

3. The double delivery-trough L, divided by the vibrating diagram g, in combination with the cam S, arms T and V, and pin d, for operating the same substantially as described.

4. The bar or rod i, in combination with the vibrating-diaphragm g, for reversing every alternate shingle on its way to the packing-box, substantially as described.

5. The sliding packing-box, having movable partitions, in combination with the inclines m, m, levers n and r, latch t, and spring z, for operating the same, substantially as described.

This invention relates to that class of mechanical contrivances known as "Shingle machines," and has for its object the construction of a machine which shall be portable, and which may be operated either by hand or by other motive power. This machine rives the blocks which are fed to it, joints and shaves the shingles, and finally piles them ready for binding or tying. To accomplish this, the blocks of proper length being placed on the carriage, on one end, it is moved forward by a cam on the shaft, operating in a rack on the carriage. This cam moves the carriage and blocks forward, just the thickness of one shingle, when the riving and jointing knife splits it off and rives the edge at the same time, so that the shingles in one bunch will all be of the same width. After being split off, the shingle is seized by two clamps, which draw it up between the shaving knives, these knives being drawn closer together as the shingle passes up, so as to taper and give it the desired shape. After leaving the knives, the shingle is released from the clamps, and at the same moment pushed by a lever into a trough. The first shingle will pass down the incline point first, and be deposited in

the receiving-box, with the thick end at one side, and the thin end in the center. By means of a cam, a diaphragm or partition in the trough is then lowered so that the next shingle will pass down another incline above the first, and be turned over during its passage, so that its thick end will be laid against the opposite side of the box from the first one, and its thin end toward the center, and so on, alternately, till the box is full, when it will be moved along for binding, and another box brought into its place, to receive shingles. By appropriate mechanism, the shavings are all carried away from the machine as fast as made.

RECENT INVENTIONS.

A NOVEL LIFE-BOAT, built on an entirely new and ingenious plan, is now on exhibition on Brannan, between Fifth and Sixth streets. In the construction of this boat, an iron keel is first laid, rising from which, on either side, is a double wall of basket or wick work, made of Manila rope wound around galvanized iron wire. This net-work is made to conform to the proper shape of a boat, with a space of eighteen inches between the two walls. This space is filled up with any light material, mixed with *papier-mache*, rendered water-proof; the material employed in this case is stalks of the banana plant. Firm water-proof sides or walls are thus built up, held in place by the inner and outer nettings, both of which are thoroughly saturated or pitched with coal tar, with a final covering of *papier-mache*, laid on smooth, over the whole. The sides of the boat are properly strengthened with iron bands, and an ordinary wooden deck. Permanent ballast is secured in the bottom. It is claimed that a boat so built will be as light as a cork, impervious to injury from collisions with rocks or any other substance; while she can neither be sunk or burned. It is thought she will ride in safety the roughest sea. This boat, which has been built as an experiment, and will be launched on the 3d of June, is 42 feet long by 14 feet beam, and will carry from 30 to 40 tons. The inventor, a Frenchman, has filed a caveat for this principle of boat construction, and in due time will apply for a patent.

CROFT'S FIRE LADDER ESCAPE.—The neat and elegant model of a Fire Ladder Escape, invented by Mr. Thomas T. Croft, of this city, and which has already been described in these columns, has been placed on exhibition at Chief Danrell's office, in New York, where it has attracted considerable attention and elicited much commendation. The invention was patented through the Agency connected with this office.

CLANY'S SAFETY LAMP, for the prevention of explosions in mining shafts or other places liable to fire-damp or foul air, may be obtained at the California Wire Works, of Mr. H. T. Graves, No. 412 Clay street. This new safety lamp is considered an important improvement upon Sir Humphrey Davy's patent, and consists in a case or guard of glass, surrounding the burner, through which the rays of light are readily transmitted, instead of through wire gauze, as in the original,—the gauze being retained only on the upper part of the lamp, for the transmission of the gases. It is really "a light to the feet and a lamp for the path" of the miner in his underground wanderings. To prevent the inveterate smoker from lighting his pipe,—the too frequent and almost the only source of danger,—the inventor has wisely provided his lamp with lock and key, so that accidents are scarcely possible.

NEW INCORPORATIONS.—Articles of incorporation have been recently filed in the County Clerk's office in this city as follows:

GARDEN CITY GOLD M. Co.—May 13th. Capital stock, \$200,000; 4,000 shares, \$50 each. Trustees: Albert Cramer, Albert S. Evans and O. D. Squire.

PACIFIC UNASSASSABLE MINING STOCK Co.—May 13th. Capital stock, \$1,000,000; 100,000 shares, \$10 each. Trustees: J. W. McKenzie, W. Monahan and J. H. Hammond.

THE TALLEST CHIMNEY IN THE WORLD.

At the Port Dundas Works, Glasgow, is a chimney which is 468 feet in height from the foundation. Fourteen feet of this is below the surface, leaving 454 feet for the height above the ground. *Engineering* says this is the tallest chimney in existence. Its outside diameter at the level of the ground is 32 feet; at the top, 12 feet 8 inches. It is seven bricks thick at the bottom, and one and a half at the top. Its section is circular throughout.

During the progress of the work of building this chimney, and while the mortar was still somewhat soft, a violent wind-storm caused a deflection from the vertical position, which at the top amounted to 7 feet 9 inches. As this would of course endanger the structure, it was determined to resort to the expedient of sawing the mortar joints on the windward side, in order to bring the column back to the perpendicular. This was done from the inside, by removing part of the brick work, half way round, making a groove about 14 inches wide. A narrow hole for the entrance of the saw was then chiselled through at a horizontal mortar joint. This was done at each end of the groove, and the two saws worked in opposite directions towards each other. Ordinary carpenter's hand-saws were used. The brick work which had been removed was replaced as the sawing proceeded. Twelve such cuts were made, at different distances, the highest 128 feet from the top, and the lowest 41 feet from the ground. By that time, the chimney was in a perfectly perpendicular position; and from that time to the present moment,—nine years,—has remained in perfect condition.

PHENIC ACID.—Phenic, or carbolic acid, noticed of late as a powerful disinfectant, has been found a most valuable remedy in certain diseases in sheep. Dr. Calvert, in a recent lecture, says the cure of scab is effected by a single dip in water containing a small quantity of the acid. For foot-rot, a mixture is made of the acid and a plaster, which is made to adhere to the animal's foot for two or three days, preventing the contact of the air. But if the flock be numerous, a shallow tray made of stone, is filled with the medicated mixture, and the sheep made to pass through it. Cattle cease to be annoyed with flies if washed with a very weak solution of this acid.

THE NINTH WONDER OF THE WORLD.—

The Stockton *Independent* has the following: "A Mr. Crandall, residing in Washington, writes to Mr. Gall, of this city, under date of April 12th, 1868, stating that he is interested in a machine, invented by a Mr. Duvall, of Washington, and designed for mining in the beds of rivers. It is so constructed that it makes no difference about the depth of the water. It will take up and wash dirt or gravel from the bottom of a stream, at the rate of from eight to twelve cubic inches per minute."

The writer enters into a calculation to show what this wonderful machine will do,—and winds up by concluding that it will wash out in ten hours, \$972,000! He adds: "We have already been offered and refused \$150,000 for the right for the State of California." The *Independent* says "Whew!" We "concur." That hundred-and-fifty-thousand-dollar man was probably not a Californian.

WOMEN'S COÖPERATIVE UNION, organized for the benefit of the sewing women of this city, is in a flourishing condition. They are now making to order about 300 shirts, and upwards of 500 garments for ladies' and childrens' wear per month. The store is at No. 39 Second street, Wehl's Block.

TEA CULTURE.—Efforts are being made, under the auspices of the English Government, to establish the tea culture in the island of Jamaica.

AN INSTRUCTIVE BOOK!

Prof. LAYRES'

ELEMENTS OF COMPOSITION,

BELLES-LETTRES AND ORATORY

For Scholars, Teachers, Lawyers all Professional Persons, and those of Common Education, who would improve the

Eloquence and Effectiveness of their Composition and Manners of Address.

Price, postage paid, . . . \$1.10

This is a new publication, and in style and treatment of this important subject, is original, simple, plain and comprehensive. The author, Prof. LAYRES (a meritorious Teacher of good standing in California, and a sound thinker and reasoner.) In his preface says: "The method pursued by the Author in developing the subject of Composition, is both the synthetical and analytical. The former is necessary to teach the theory, the latter the practice of the art; and as these are both indispensable to the scholar, so are also the two methods, as the sequel will show."

The Work has lately been approved and authorized by the State Board of Education for use in the Public Schools. To further illustrate the varied and popular endorsement the book has so rapidly received, we quote the following

RECOMMENDATIONS:

It is simple, concise, and well arranged. It seems to be a work of great value.—*John Smith.*

I am prepared to concur in the recommendation of the Honorable Superintendent of Public Instruction.—*J. G. Pelton.*

After as careful and thorough perusal of the same as it was in my power to give, I come to the conclusion that, for conciseness, correctness, and precision of definition, as well as for completeness and simplicity of style, it was, and would be, without a rival. I regard your work as the best of its kind. I know of but few men in any profession who would not be benefited by its careful study.—*Wm. H. Hall.*

I regard it as one of the best treatises upon these important branches—perhaps the only one obtainable possessing equal advantages—conciseness, and simplicity of style, as well as of its kind. I know of but few men in any profession who would not be benefited by its careful study.—*Wm. H. Hall.*

It is admirably arranged to develop the correct idea of the analysis and synthesis of language, and the amplification of ideas into sentences and periods. The style is clear, terse and pleasing. I do not hesitate to recommend it as a great acquisition to our text books.—*James Dennon.*

I am happy to express my conviction of the value of the whole treatise. It would give me much gratification to see so thorough and excellent a treatise emanate from young California.—*Martin Kellogg.*

I recommend it to all those who wish to obtain a book that will give them definite ideas on the correct idea of the analysis and synthesis of language, and the amplification of ideas into sentences and periods. The style is clear, simple, and forcible manner.—*Caroline L. Atwood.*

I regard the book about to be published as far superior to any work extant upon that subject.—*Wm. S. Hunt, A. M.*

I believe the work will be a valuable and much needed addition to our school text-books.—*Herman Perry.*

You have brought the results of a profound analysis, and made them available, in a practical form.—*J. H. Brayton.*

I can recommend it particularly to my young friends of the legal profession, as a source from which they may be able to learn much of value as special pleaders and advocates at the forum.—*John Curry.*

The subjects upon which you treat have heretofore been too much neglected in the education of young men in America. . . . Exactly calculated to interest. . . . It will soon become a necessity in every lawyer's library.—*Charles A. Tuttle.*

Its clearness and comprehensiveness make it easy.—*G. W. Boies.*

A gentleman of varied learning and ripe culture, who has half a dozen languages at his tongue's end. He seeks to teach the student not only how to take sentences apart, but how to put them together. His system is not merely of reality. We know of no work in which can be obtained so lucid an exposition of the elements of composition, and such valuable assistance in learning how to put his ideas into language. Prof. Layres has done the cause of popular education good service.—*S. F. Bulletin.*

This is a San Francisco book by a San Francisco author. It contains 166 pages, and is altogether creditable to San Francisco. It meets a public want, and meets it in a form and size cheap and convenient, and in reach of the humblest.—*Alta California.*

The writer, the lawyer, the minister, or the statesman, may study its rules and definitions with profit. Nothing conduces more to the purity of a national literary taste than a general and thorough knowledge of the rules by which the construction of language is governed.—*S. F. Times.*

Prof. Layres plunges at once "in medias res." He seizes a sentence (which is the unit in composition, whether written or spoken) holds it up before you; tears it to pieces before your eyes—or rather, we should say, neatly and skillfully dissects it—displays one by one its several parts; makes you thoroughly acquainted with each, in its entirety; and then shows you how to put them together again. A series of such experiments, increasing in complexity gradually, till you do not feel the difficulty, and the thing is done; you are master of the subject.—*Mining and Scientific Press.*

Its design is to show that ideas can be so arranged as to increase their power; in short, to teach the mechanism of composition, eloquence and oratory. A desideratum long felt is supplied.—*S. F. Examiner.*

This is an age in which the occasions are rapidly multiplying, when educated men, and women, too, are called upon to express their views in writing, either for public or private inspection and criticism.—*Stockton Independent.*

The most eminent educators in California give it their hearty approval, and we concur.—*Marysville Appeal.*

Not only one of the best of its kind, but what is still better, one of the briefest. It contains 166 pages.—*Virginia Enterprise.*

PRICE, \$1.10. Sent by mail, postage paid, without extra charge. Liberal reductions made to the Trade, Teachers and Schools, ordering by wholesale. Orders received by our Traveling Agents.

Address DEWEY & CO., Mining and Scientific Press, San Francisco.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

Alpine County.

Miner, May 2d: The Morning Star mine looks better than ever before. The ore is easier broken down than in the upper levels, and can be mined to better advantage.

The lateral tunnel of the M. C. M. Co. is now in 223 ft., 63 ft. having been made during the month of April.

The Imperial tunnel is in softer rock and the contractor is making wages again.

L. L. Lewis, Supt. of the American Co. has repaired the flume, and set the pump going to drain the works.

The Pittsburg have cut another lode, and have, we understand, a three-foot vein of ore.

Chronicle, May 2d: The Morning Star mine has a large body of rich black ore similar to that taken out two years ago and shipped to England. We learn that the Trustees will shortly visit the mine with a view to the erection of smelting works.

Mount Bullion is one of the liveliest camps in our county. The Tunnel Co. are pushing ahead. The tunnel is now in a little over 200 ft.

Amador County.

Ledger, May 9th: The Tubbs quartz mill, one mile north of town, got up steam on Monday, and is now crushing rock. This mine will be vigorously worked from this time on.

During the past week, richer quartz than ever has been found in the south lead of the Coney & Bigelow mine. The specimen shown us is full of free gold, while the sulphurets sparkled all over it.

The Maxwell Mining Co. has been organized and incorporated to work the first south extension of the celebrated Eureka mine at Sutter Creek. Some very rich ore was taken from a shaft on the lode years ago.

Calaveras County.

San Andreas Register, May 9th: Messrs. Snyder & Mester paid a visit the other day to the Fair Play quartz mine, for the purpose of starting work thereon. They have commenced the construction of a water-power quartz mill.

Inyo County.

Territorial Enterprise, May 12th: Mr. Delavan writes from the Cerro Gordo mines, under date of May 1st, that all kinds of mining operations were being prosecuted with renewed energy, and ore was being forwarded to San Francisco at a fair profit. The whole cost of delivering ore in San Francisco is set down at \$100 per ton. Such ores as are thus shipped will produce from \$300 to \$800 per ton. A wagon road from the mines to the valley, a distance of seven or eight miles, is spoken of as something very much needed.

Kern County.

Havilah Courier, May 2d: T. J. Williams, foreman of Col. Rand's mine, informs us that the pumping and hoisting works are now on the way from San Francisco.

At Keysville, considerable work is being done in ground sluicing, and a great deal of gold taken out. In Ticknor Basin, and Kelsoe Valley, placer mines are being worked to great advantage, and we are informed by a gentleman from Tehachapi, that more work will be done in the mines there this season than for several years past, there being an abundance of water to last the entire season.

In the Burning Moscow, a run of five days to test the rock, yielded a little over \$25 a ton.

Havilah correspondence of Visalia Delta, May 6th: The Delphi mill is running a portion of the time, but owing to the surface water, the mine is very wet, and rock is not quarried as fast as the mill (10 stamps) can crush it. This mine has the richest rock of any in the county. The New York Clear Creek G. M. Co., will soon begin a tunnel to open their mine to a greater depth. They have a good 10-stamp mill.

The Howe Bros. are not doing anything as yet. The Joe Walker Co. have been continuously at work and doing well. Their lode is from 5 to 12 ft. thick at the depth of 300 ft.

Sagoland district promises to take the lead in this county, in the number of mills and the richness of its mines. Three or four mills will be erected this season.

In Kelso district, work on the Piute lode will be resumed shortly. They are down with a double shaft 225 ft.

Los Angeles County.

The *News* of May 5th has an editorial upon the mines of Southern California, and the neglect which they have suffered for

the want of capital to develop them, although in reality fully equal to those in the more northern portions of the State. We quote: But a short distance to the north of this city is a district rich in placer mines, called San Feliciano and the Casteca mines. Here, in the winter, hundreds of our native Californians labor with success, realizing from \$3 to \$5 per day. It only needs some enterprising capitalist to construct a ditch, with reservoirs, to lead the waters of the San Francisco Cañon into those placers, and employment all the year round could be given to thousands, who would make large wages. East of the San Francisco Cañon, some 15 miles, and about 60 miles from Los Angeles, are the quartz and copper mines of Soledad, which bid fair this summer to prove the richest mines of California. The mines of gold are extensive, and discoveries are made daily of new ones. Arastras are now in operation, and a mill will be erected by Messrs. Searles & Yates, to run by water power, which cannot fail to prove a fortune to the lucky owners. These veins are wide, well defined, and gold can be seen glittering in nearly every piece taken from the lodes. These mines are sure to attract a large population this summer. It has the finest climate in the world. Game is to be found in abundance, and the water is unequalled.

Nevada County.

Transcript, May 7th: Every company in the vicinity of Moore's and Woolsey's Flats is washing, and not an idle man can be found in the streets during the day.

Since March 1st, 26 companies have located 50,920 ft. in the county. This is up to May 1st.

Same of 8th: The Banner Mining Co. is now setting up one of Henry's rock breakers and also in adding 10 stamps to the mill, which will give them 30.

Mr. Mattingly is opening a ledge near the Banner which gives evidence of being rich. He is running a tunnel for the purpose of striking the ledge at the depth of 40 feet. Rock from the ledge near the surface paid \$11 per ton.

A crushing of 15 loads of quartz from the Inkermann mine has just been cleaned up at the Gold Hill mill. The yield was \$51.10 to the ton.

The Constitution Co. have located 3,000 ft., commencing at Mooney Flat ravine and running back into the hill.

The new sulphuret reduction works at Canada Hill are expected to be ready for work in 10 days. It is estimated that their establishment cost at least \$60,000.

Same of 9th: The Kentucky Blue Gravel Mining Co. is engaged in prospecting for the blue lead at Snow Point. They are down 150 ft. and expect to reach the lead by going 125 ft. further. They are sinking through gravel at the rate of four ft. in 24 hours.

10th: The Osceola Mining Co., at Rough & Ready, are about running a prospect tunnel, on contract, for the purpose of opening the mine.

Gilham, McSorley & McAuley have laid water pipes and are about opening a new set of hydraulic claims at Randolph Flat. Barker & Rex, and several other companies, are also engaged in hydraulic mining.

12th: Thos. Allen, who is mining near Rock Creek, is working 12 men, and making from \$12 to \$15 per day to the hand.

W. C. Ralston has sold 1-40th interest in the Eureka mine, Grass Valley, to Andrew J. Pope, for \$20,000. At this rate the value of the mine would be \$800,000. It was purchased several years ago from Fricot for \$450,000.

Gazette, May 5th: The Whartenby and Leavitt claims at the head of Broad street, on Kelsey Ravine, are being worked by hydraulic power.

Same, 6th: The Chalk Mountain Co. are taking out considerable gold at their claims near the Cascades. Last Thursday one of the workmen found a chipa weighing four ozs., and one pan of the gravel yielded \$44. The gravel is washed daily, and on Saturday the yield was 8½ ozs. The company purpose erecting a cement mill. The Red Diamond Co. near by, are obtaining prospects of \$1 to \$2 a pan on the bedrock, but their tunnel has not yet reached their best ground.

Grass Valley *National*, May 4th: On the Diamond ledge, Osborne Hill, the Fowler Bros. have succeeded in striking a ledge, a foot in thickness, from which some rock has been taken, that shows well in sulphurets and gold.

5th: We were shown some rich specimen rock from the fourth level in the New York Hill mine, this morning. The ledge will average in thickness from eight to twelve inches.

Yesterday the clean up of a crushing from the Union Hill mine was brought into town. There were 106 tons of rock crushed

which yielded 35¼ ozs. of gold which at \$17 per oz., gives \$6,018 to four young men, who have been about 30 days in taking it out.

7th: We are informed that the Hope Gravel Co. have about completed their hoisting works, which they purchased of the old Alta Co. and removed to their ground. By the middle of next week a 12-inch pump will be started, with sufficient power to raise water from the mine in immense volumes. It will take but a very short time to relieve the mine of water.

Placer County.

Dutch Flat Enquirer, May 9th: Since the blue lead discovery in this place was made public, the miners have been busy in relocating their claims, and considerable activity prevails. Nearly every one who has a claim, or can procure an interest in one near the line of the supposed gravel deposit, is making preparation to prospect. Our town and surroundings have an air of business life similar to that experienced years ago.

Plumas County.

Quincy National, May 2d: The Crescent mills, under the new administration, are to commence crushing on Monday next. Peard had a lease of the Crescent—which expired when Mr. Marcuse took possession—and from his last run of seventeen days, cleaned up 400 ounces. The mill will also crush rock from the Imperial ledge.

Messrs. Miller & Ellis, on Taylor Creek, near this Valley, discovered a quartz lode last week, which promises to be valuable. The ledge is large, and prospects at the rate of "75 colors" to the pan. Mr. Miller's placer claim on this creek is paying an average of \$7.50 a day to the hand.

Messrs. Bachellor & Viets, of Cherokee, are running a new tunnel to their ledge. Their rock pays more to the ton than any ledge in the county. Their little mill in Dixie Cañon has been idle for some time, on account of bad roads between mine and mill, but they are already to start up again.

At Round Valley, Judkin & Kellogg's mill, which has been idle for some time, commenced crushing on Thursday of last week.

Letter from North Fork: The miners will be backward this year in getting into their river claims. The Brewsters are having a fine run of water on Red Rock. They have 10 hands ground sluicing, and expect to take out "slathers" of gold. None of the miners on Dutch Hill or Barker Hill have commenced hauling dirt this spring, but most of them expect to begin in two or three weeks.

The *Union* of same date says: On Rich Gulch, Gambin is piping at the head of the gulch with plenty of water. Capt. Corser is also uncovering considerable bed rock. Mardon & Co. on Missouri Flat, in the old Pike claims, are now running a cut. Schieser & Co. are piping on Dingbat. The Hallsted Co. on Rush Creek Flat, have plenty of water and are working their claims to advantage. Hyde & Ward are at work on 12-Mile Bar; they are making wages.

The Wescott quartz mill in Indian Valley, will commence crushing quartz again in a few days.

San Bernardino County.

Guardian, May 2d: From a gentleman just down from the mines, we learn that there are 40 miners at work in the placer diggings in Holcomb Valley, and that they are realizing from \$2 to \$6 a day. Water is in abundance for all mining purposes.

Sierra County.

Messenger, May 9th: While Charley Gager, John Cunningham, and Dick Christopher were ground sluicing in their claims in Slug Cañon, a few days since, they struck a seam of rich quartz in the bed rock, gold being visible in considerable quantities. The bed rock is very soft and prospects well when panned out.

The Union claim at Gibsonville is said to be paying splendidly. For one week's work it divided \$150 to the share in profits. The Gold Bluff Co. are now using the Giant Powder altogether. Other companies will soon abandon the old powder and work altogether with the new.

Camptoville letter: The road has been moved from the mining ground; two companies have been piping away at the hill for some time past. There has been no cleaning up yet, but the hill is known to be rich.

Tulare County.

Visalia Delta, May 6th: At White River, Mr. Carter will start his mill in a few days, on first rate ore. This company have developed their mines sufficiently to discover an inexhaustible supply of \$25 rock. A. J. Maltby has made a clean up of 246 ozs. of bullion, from a run of 50 tons of ore from the Eclipse mine, being about \$70 per ton.

Tuolumne County.

Sonora Democrat, May 9th: In the Garner mine, at Oak Flat, a well defined vein from three to four feet thick, and of very rich rock, had been struck on the north side of the river. The ledge on both sides looks well. The mill-site is well chosen. The mill will be finished in a few weeks.

ARIZONA.

Miner, April 25th: Messrs. Frink and Barton arrived in Prescott from Wickenburg at five o'clock yesterday morning. Mr. Phelps had arrived at Wickenburg with 40 tons of machinery. A brother of the inventor of Hendy's concentrator, accompanied him. A rich silver ledge has been discovered about 20 miles east of Wickenburg, also a good ledge.

The Chase lode is looking well. The mill will be ready to run by May 1st. A tunnel has been started. Shaft 102 ft. in depth.

Letter to same from Williams' Fork: "As for the mines, the Springfield Co. has suspended work. Mr. Flower, the Supt., says he would not go up and down the creek for all the mines on it. Capt. Ashley, of the Planet, and the Great Central Co., under your humble servant, are shipping good ore. We both got a steamboat load off last month, and expect another boat on every day to take off another load. I intend to work all summer if the Indians don't steal my teams and animals."

COLORADO.

Denver News, April 22d: A private letter from Lake county says the boys in Granite District are finding lodes nearly every week. Morgan's men, on the Yankee Blade, are getting out nice quartz. Things look promising. The Moyer boys have found a lode on the patch diggings, which beats all heretofore. At Idaho, and on the bars above and below, every man is at work.

Letter from Lincoln City: The Grant Mining and Fluming Co. has already placed upon their ground a large amount of lumber and other materials, preparatory to an early campaign. The Badger has a flume over 1,000 ft. in length. The Flushing Co. has been running five years in succession. The Lincoln City Co. placed their flume three years ago, and have more than realized their expectations. Notwithstanding the severity of the winter, they have worked incessantly. The Upper Fluming Co. expects to begin early this spring. They have a large amount of timber on the ground.

Georgetown Miner, April 23d: The Brown shaft last week was completed to the tunnel. Work on the New Boston shaft has been suspended until the tunnel reaches the vein, which will probably be in a week or 10 days.

Garrott, Martine & Co's reduction works, between the 7th of August last, and 1st of the present month, have run about 70 days, and treated 166 tons and 1,300 lbs. of ore, from 35 different lodes. The amount produced was \$18,124.90, an average yield of \$108.79 coin value per ton in silver.

Herald, April 22d: The Montana mill has been started up on custom ore. We have heard that a 40-stamp mill is to be put up on North Clear Creek. The parties are on the way from the East with the machinery. Mr. L. C. Miley is fitting up the Holbrook 8-stamp water mill, and will soon start it up on custom ore. The little 8 stamp mill of Uncle John Beverly, Nevada Gulch, has been put in order for running. Five tons of galena ore from the Washington lode, gave two bricks worth \$451. The Ophir Co's mill, Nevada Gulch, has been shut down for repairs. John Boylan yesterday started up the Enterprise mill. This mill, since having been shut down, has been put in A No. 1 order. It is being run on custom ore. Last week, Messrs. Moores & Myers run two cords of Bates ore through the Wilson mill, from which they retorted 20 ozs. gold.

Three miners who are working near the mouth of Chicago Creek took out 13 ozs. 6 pwt. 4 grs., working 5½ days last week. They are now working in the old bed of the creek, and have to pack their pay dirt to the water.

DACOTAH.

The *Idaho World* gives part of a letter dated South Pass City, April 10th, as follows: I think the mines here are very limited in extent, and not very good pay at that. Pease and Charley have got in; they found nothing while prospecting. Charley was gone two months, and returned yesterday. We will begin work on our ground next week, and will soon know what it will pay. We got pretty fair prospects. I thought there would be diggings struck outside, but the chances are slim now; nor do I think so much of the quartz here as I did a while back. You had better not advise any one to come to this country—it is

a hilk, or nearly that. We hope to make a little money this spring, so as to get away.

IDAHO.

The *World* April 29th, says this is the dull season ever known. The snow fall, on which the supply of water depends, has been very small. Only a few of the miners are likely to be able to work their claims through the ordinary mining season. Towards Centerville, in Baboon Gulch, just below the Summit, a dozen hydraulics are in active play, and up the gulches ground sluicing is industriously prosecuted. From the Summit on to near Grimes' Creek there is little doing, but thence on into Centerville, and all about there the glad sight of busy mining is presented. From Centerville to Wolf Creek there is very little mining going on. The creek operations of the Smith Bros. are suspended until the water is lower. On the hills in front of Placer-ville, where over 10 ft. of ground will yield a hundred dollars, mining has ceased, save in one or two claims. But in the run of from eight to twelve days, which was given to the claim owners, they derived very rich products; in one instance, a clear profit of \$2,300. At Granite Creek, the hydraulics of Ellis, Devine, Leary & Co., are in constant play, and Granite is, in proportion to its size, the liveliest camp in the Basin. Mr. J. M. Claxson, at the large 25-stamp mill at Pioneer ledge, has lately struck a new vein in that mine, the ore from which the mill is now crushing day and night.

A few days ago the largest lump of gold ever found in Moro's Creek, was taken out by John Noonan, from his claim at More-town. It weighed just \$7.

Deadwood correspondence of same: There are now about 100 miners here, and I think it is going to be a pretty good camp this season. Out of about 200 claims, 150 have been prospected and show well—that is, they will pay \$10 to the hand. Judge Gray, Romer and Whiting have good ground; Bill Newton has one of the best claims here—a hill claim, in which the dirt pays from five to ten cents to the pan from the surface to the bedrock, about four ft. This claim is the only hill diggings yet struck and prospected, but I believe claims on other hills will be found which will pay equally well. We want about 50 or 60 practical miners here yet, and their labor will be well rewarded, for I think that in six months this will be another Idaho City. J. Madden, Jackson, McIntosh, Duffy and myself have opened two of our gulch claims. We shall have plenty of water in three or four days.

MONTANA.

Virginia Post, April 25th: Bates & Trevitt's mill is now running on full time, the owners apparently well satisfied with the returns. Several parties have commenced mining in Alder Gulch, but the cold weather interferes somewhat with their operations. All are complaining of the scarcity of water. Hundreds of miners were busy at work yesterday, for the first time this season, in consequence of the water being let in the big ditch, and great was the rejoicing thereat. Some claims in Boomerang Gulch are reported to be paying from \$10 to \$12 per day to the hand, though the majority much less. Taylor & Thompson are putting an engine on their claim for hoisting purposes. A third hydraulic has been started on McLellan Gulch. The owners state they have sufficient ground they have prospected and know to be good, to keep these three hydraulics running for 25 years, at an average pay of \$8 a day to the hand. Mining in Tucker Gulch and vicinity is progressing as well as could be expected, with the amount of water obtainable. We learn that as high as \$10 to \$15 to the hand has been got out by the slow process of "rocking." S. F. Molitor & Bro. cast yesterday a gold bar of the coin value of \$3,587 64, from a six days' run of J. C. Ricker's mill, on second class rock from the I. X. L. Co's claim, on the Union lode. Mr. Kicker is down on the incline 300 feet, with a fine, wide vein. At French Bar, mining operations are reported as at a standstill for want of water. Dry Gulch opened up very promisingly early in the season, and some large runs were made on the left hand fork, but water has recently failed and little can be done at present. Two new discoveries of quartz have been made in Brown Gulch district. One ledge has been named the Gould & Curry; the other the Shepherd & Christenot, after the discoverers. The specimens of the rock shown to us are very fine, and the crevice of the former is seventeen feet. The owners are getting out rock, which will be crushed at Christenot's arrastra. An arrastra is being put up on the Brannon lode at Mill Creek. The ledge has a shaft 80 ft deep upon it, and a crevice of four ft. The owners have out 100 tons of fine rock.

Diamond City correspondence of same: During a 10 hours' run last night, McGregor, Thomas & Co. cleaned up from their claim in Confederate Gulch, over \$1,800 in clean, coarse gold. This amount was taken out by five drifters, from a space 20 ft. long and 3 1/4 ft. wide. The entire amount of dirt from which this gold was washed, did not exceed 70 cubic ft.

Phillipsburg do. April 15th: The Stuart mill started on the 26th of March, crushing Dashaway rock, and cleaned up with good results. It is now crushing rock from the Van Timmoos lode, which is expected to far exceed anything ever worked in the mill. After that they will crush 16 tons of ore from the Ophir lode, prospecting equally good. Work is progressing on several leads—the Camanche in five different places. The Pride of Montana has a tunnel in 80 ft., with good indications. Shafts are being sunk on nearly all the ledges in the camp.

Radersburg, do. April 3th: I understand that from \$20 to \$25 per day to the hand is the average in Hope and Charity Gulches, and Bay Horse Bar, while still greater clean-ups are obtained from various sags and hills where ground-sluicing is practicable. A majority of the miners are holding over until the upper ditch is finished.

Bannack, do. April 16th: There are now ten men mining in this camp to one any previous year since 1863. There are in all eight ditches bringing water into this camp, and they will be used this season to their utmost capacity. N. E. Wood, Snp. of the New Jersey G. & S. M. Co., is still running his Bullock's Crusher, working only one pan. He is crushing quartz from the Cherokee, and is cleaning up weekly from \$1,000 to \$2,000. Messrs. Derier and Falls are putting up a furnace on the plan of Mr. Esler's, to smelt the silver ores of the Blue Wing district. Messrs. Robinson and Wright are taking out tons upon tons of rich ore from the Silver Rose. Mr. Falls has also out a large amount of rich ore from one of the Blue Wing Leads.

The Montana Mineral Land & Mining Co's 24-stamp mill is running on quartz from the discovery of the Dakota lead.

NEVADA.

Esmeralda.

Territorial Enterprise, May 5th: We yesterday saw a gold brick from the Wilson mine, Pine Grove, which weighed 1,099.15 ounces, and is worth \$20,346.02, being the most valuable bar ever molded in this State.

An Aurora telegram dated May 9th, is as follows: "A rich discovery has been made at Brodie, within a few days. Dan. Olstein has discovered a quartz ledge on High Peak, near the Empire Co's works. Joe. Hutchinson, one of the owners, brought some of the rock in town to-day, and it is certainly rich—principally gold. It has created a great quartz excitement amongst the mining community. The owners think it will average \$1,000 per ton."

Humboldt.

Register, May 9th: The Essex mill, at Dnn Glen, is in complete order and doing fine work. One hundred tons of ore from the Monroe mine has just been put through the battery and is now being worked in the pans. About 100 tons more of this ore is ready for the mill, and will be converted into silver bricks immediately.

Palmer.

The Silver Bend Reporter's Hiko, correspondent says, April 20th: The first silver brick of the Palmeragat Valley S. M. Co., located at this place, has just been retorted, weighing about 1,100 ounces, and 867. fine. You should see this mill to know what perfection of machinery is. From that part where the ore is dumped to the dryer, the battery, the furnace, the pans, and the retorting room, everything gravitates.

Some gentlemen representing a Chicago company are prospecting the Webster lode, and intend commencing the erection of a "20-stamper" as soon as they strike the vein. Another party are experimenting on our ores with a view of smelting; so far, they have met with encouraging success. Great energy is being displayed by the Alameda Co. They are taking out more ore now, daily—averaging about \$140—than a 10-stamper will require. The mine they are developing is on the List lode.

Reese River.

Silver Bend Reporter, May 2d: The Enterprise Co. Gold Mountain district, about 45 miles south of Silver Peak, have made arrangements with J. E. Clayton, an experienced mining engineer, to erect a small mill in the district for the purpose of testing the value of the "Stato Line" ledge. The ledge is possibly south of the State line, and consequently in California. It is from 10 to 12 ft. wide and rich in gold. Six hundred sixty-six pounds were worked

in this place (Belmont) and yielded \$131 per ton. The mill will have a battery of two newly invented steam stamps. The Enterprise Co. thus far are the sole occupants of the district, having located everything yet discovered, though doubtless there are many other ledges there. There is plenty of timber for fuel close at hand, and timber suitable for lumber at a distance of 15 or 20 miles. Water abounds in numerous springs a few miles from the mines, but wells will have to be dug to ensure a convenient supply.

A lot of chloride ore taken from near the surface of the El Dorado South ledge was taken to Austin and reduced and yielded \$557 to the ton. The ore was taken from an immense chimney. A number of tons are already extracted and ready for reduction.

The Belmont Co's mill has shut down a few days for repairs.

Mr. White, Superintendent of the Northumberland Co., will enter into arrangements immediately for machinery for a 10-stamp mill, and will erect it before winter sets in; he will also put an additional force of men upon the ledge. The tunnel running for the ledge, which it will strike a considerable distance from the surface, is now quite near to it.

Messrs. Gillett and Clark of the Wyoming ledge have disposed of 300 ft. of their location for \$10,000. Work will go on with vigor by these same gentlemen, who are negotiating a lease of the 10-stamp mill in Hot Creek Cañon. Several other veins in that region are to be worked.

At the Combination mill, Mr. J. M. Dawley, General Superintendent, has made some salutary changes about the establishment, and the reverberatory furnaces are now unsurpassed by any in the country, and work splendidly, as does everything in connection with the mill. The bullion now coming from the mill is much finer than at first—exceeding .800. About 70 men are at present employed at the mill in the several departments, and everything moves like clockwork.

Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

Territorial Enterprise, May 5th: The Occidental Co. are about to sink a shaft in air mine to the water level. They already have an incline down upon their lowest level to the depth of 100 ft., and this will be carried down until water is struck.

Same of 6th: The Sutro mine, so long neglected, is about to be awakened from sleep. A party interested will soon leave for San Francisco to raise money and procure machinery to work the vein. We were yesterday shown an assay from the croppings of \$49.30 per ton in silver.

7th: We were yesterday shown some exceedingly rich specimens of silver ore from a lead just discovered in the vicinity of Pyramid Lake. Parties in this city were yesterday making preparations to go out and examine into the truth of the reported discovery. If the ore shown us actually came from a newly discovered lead, and a lead of fair size for working, it is one of the most important discoveries that has been made in a long time.

8th: The Justice-Independent Co. started up with their new machinery on the 6th inst. Every part of the machinery works to perfection. They now have two good engines, pumps, reels, etc., all in good working order, with power sufficient to sink and drain their mine to a depth of 1,000 ft.

9th: A very rich strike was made evening before last in the claim of the Cole Co., west of the city and back of the Comstock. The strike was made in the second level, 300 feet below the surface, and reached through a tunnel 600 ft. in length. The ore is a black sulphuret, and is astonishingly rich in gold as well as silver. We were yesterday shown assays of two samples as follows: First sample, at the rate of 358.68 ozs. of silver and 56.074 of gold, or \$1,177.65 in gold and \$466.23 in silver, making a total per ton of \$1,643.93. The second sample yielded at the rate of \$1,160 in gold and \$475.80 in silver, or a total per ton of \$1,635.80.

11th: Two new tanks, working the same as cages, for hoisting water are now in operation at the new Imperial-Empire shaft. The two tanks have a hoisting capacity of 316,800 gallons per day. The water which raised above the drills after the breakage a few days ago, yesterday at noon had been reduced to within a couple of feet of the track floors of the drifts.

Trespass, 9th: In the Opbir, the shaft was down 220 ft. last night, with softer ground at the south end. Gould & Curry is being slowly cleared of water. Savage shaft has been sunk the usual depth this week.

...In Hale & Norcross, a drift has been started from the 1,030-ft. level. Chollar-Potosi incline is down 156 ft. Kentnack mine was never looking better. Crown Point looks well. In Belcher, the cross-cut at the 850-ft. level is yet in clay and porphyry. The main east drift—730-ft. level—has exhibited a marked improvement. Overman ore improves at the 1st and 3d levels north.

The following is the statement of the amount of bullion shipped during the past week by Wells, Fargo & Co., in this city: 3,394 lbs. of assayed bullion, valued at \$97,839.22. Gold Hill, 5,502 lbs., valued at \$190,005.53.

NEW MEXICO.

Santa Fe Gazette, April 4th: Col. R. A. Kenzie and others have organized a company, with a capital of one million dollars, for the purpose of carrying on silver mining in the Magdalena Mountain.

OREGON.

Jacksonville Sentinel, May 2d: The work lately done by the Occidental was an experiment. It has proved satisfactory, leaving a good profit, after paying expenses of quarrying and crushing, and the mill will resume work as soon as sufficient rock can be got out to commence on.

Messrs. F. and T. Newland, Fox and Patty, are running a tunnel into the hill facing Allen Gulch, Josephine county. They have prospected the hill and find a deep channel near the summit, and have found also that all the gulches that have cut this channel have been rich, while those which have not cut it have never paid. The tunnel at present is in 190 ft., and they expect to have to run 25 ft. further before striking the channel. Two shifts of hands are being worked, so that the labor ceases not by day or night.

The Dalles Mountaineer says that Stephen H. Meek, the old pioneer guide, has left for the Emigrant diggings region. He expects to raise a company of prospectors at Canyon City.

KEROSENE LAMP EXPLOSIONS.—The following valuable hints are from an article in the Boston Journal of Chemistry: A lamp may be filled with bad kerosene, or with the vapor even, and in no possible way can it detonate, or explode, unless atmospheric air has somehow got mixed with vapor. A lamp, therefore, full, or nearly full, of the liquid, is safe; and also one full of pure warm vapor is safe. Explosions generally occur when the lamp is first lighted, without being filled, and late in the evening, when the fluid is nearly exhausted. The reason of this will readily be seen. In using imperfect or adulterated kerosene, the space above the line of oil is always filled with vapor; and so long as it is warm, and rising freely, no air can reach it, and it is safe. At bedtime when the family retire, the light is extinguished; the lamp cools, a portion of the vapor is condensed; this creates a partial vacuum in the space, which is instantly filled with air. The mixture is now more or less explosive; and when, upon the next evening, the lamp is lighted without replenishing with oil, as is often done, an explosion is liable to take place. Late in the evening, when the oil is nearly consumed, and the space above filled with vapor, the lamp cannot explode so long as it remains at rest upon the table. But take it in hand, agitate it, carry it into a cool room, the vapor is cooled, air passes in, and the vapor becomes explosive. A case of lamp explosion came to the writer's knowledge a few years since, which was occasioned by taking a lamp from the table to answer a ring of the door bell. The cool outside air which impinged upon the lamp in the hands of the lady, rapidly condensed the vapor, air passed in, explosion occurred, which resulted fatally.

USE OF DIFFERENT IRON ORES.—Robert Hunt, F. R. S., keeper of the Mining Records of Great Britain, publishes the following list of the varieties of commercial iron ore produced in that country, showing the proportions in which they are employed in British iron manufactures:

Red Hematite, 15 per cent; Brown Hematite, 13; Oolitic brown Hematite, 26; Black Band, and Argillaceous Ores, 42; Spathic Ores, 2; Magnetic Oxide, 2.

THE case of the Nicolson Pavement Company vs. the Stow Pavement Company, action to restrain defendants from manufacturing or laying block pavement, was decided in the U. S. District Court on Tuesday in favor of the defendants.

San Francisco:

Saturday Morning, May 16, 1868.

Notices to Correspondents.

A WELL-WISHER TO SCIENCE is informed that the foreign members or Fellows of the Royal Geological Society of London, usually number from fifty to sixty. The last list which we saw contained the names of six Americans. A foreign member is not called upon to pay any admission fee or annual subscription. Such members are usually elected only at the annual meetings, and at the recommendation of the Council. A foreigner may, however, be proposed at any of the ordinary meetings by any Fellow of the Society, and balloted for in the same manner as is employed in the case of ordinary Fellows. In the required preliminary certificate, in the case of foreign candidates, the proposer, whose name stands first, need not certify to personal acquaintance; but only to his knowledge of the works and the respectability of the candidate; nor need the certificate state that the candidate is desirous of becoming a foreign member. The usual number of ordinary members amounts to 900, which, with fifteen honorary members from the original society, half a dozen royal personages and the foreign members above noticed, make up a total amounting to nearly 1,000.

ANOMALY.—The phenomena you witnessed are due to what is called dimorphism, first noticed by Mitscherlich. Sulphur, the article you was experimenting with, is one of the readiest substances obtainable for exhibiting the phenomena, for when crystallized by fusion, it affords oblique rhombic prisms; but when precipitated from solutions, it is deposited in the form of rhombic octohedrons. Carbon is found in the diamond, crystallized as octohedrons; but in graphite (plumbago) in hexagonal plates. Carbonate of lime in calc spar, possesses the rhombohedral structure; but in arragonite that of the regular octohedron. There are many other analogous cases. It has been found that in cases of dimorphism, each form has its peculiar density; the specific gravity of calc spar for instance, being 2.71; that of arragonite is 2.94. The temperature at which the crystals are formed is found to be an important influencing cause; for when carbonate of lime is precipitated by adding chloride of calcium to carbonate of ammonia, the precipitate is found to consist of rhombohedral crystals, if thrown down at a temperature of 50°; but possessing the octohedral form if the solution is 150°.

GALLIA.—Your opponent was correct in stating that many of the asserted discoveries of Lavoisier have more than been overshadowed by Ray and Mayon; and others are justly due to Black, Scheele and Cavendish, and the discovery of oxygen was undoubtedly due to his friend Priestly. In extension of the memory of Lavoisier, it must however be borne in remembrance that the untimely manner in which his valuable life was cut short, rendered it impossible for Lavoisier to afford many personal explanations, which, had he lived, he would have been enabled to do, and most probably would have done, which would have tended very much to modify the severity of his more virulent critics.

J. ROSS BROWNE'S SUCCESSOR.—It has been reported that Rossiter W. Raymond, of the *American Journal of Mining*, was the man; but the report was probably premature. At any rate, we have not seen any telegram announcing the fact.

Petroleum for Steam Fuel—Economic Considerations.

The experiments recently undertaken in various parts of the Eastern States, for utilizing petroleum as steam fuel, and which excited so much interest on both sides of the continent, seems to have been finally transferred to San Francisco. We have already alluded to several experiments in this direction, undertaken by Col. White, of this city, the inventor of the California system for burning petroleum, and also to those made on Mission street by the California agent of the "Foote Patent." Both these gentlemen have been actively engaged during the greater part of the winter and spring in furthering the interests of their respective patents. Col. White has been lately experimenting with one of the city fire engines, and has also had two large retorts made for the Aetna Foundry, to be used in making steam for driving the machinery of that establishment. Satisfactory success has thus far attended his efforts, although his projected series of experiments has not yet been completed.

The "Foote Patent" process has been placed upon the steamer *Amelia*, and a preliminary trial was made on Saturday last between Broadway wharf and Hunter's Point—about seven miles out and in. We understand that the experiment was quite satisfactory to the parties interested. Further trials will be made in a few days, with the view of testing the comparative cost of coal and petroleum for the production of steam.

The utilization of petroleum for steam fuel is a matter of much importance, particularly on this coast, where the inauguration of steam communication between San Francisco and China, involving voyages of over 6,000 miles, without coaling stations, has demonstrated, in a most striking manner, the necessity of a more condensed form of fuel than any hitherto employed. The question is also one of much scientific interest, and has elicited much study from the chemist, the economist and the expert. We have already alluded, in previous issues of the *Press*, to the fact that the use of petroleum for steam fuel might be proven of no economical value in our Eastern cities, and still become a most important and practical success on the Pacific Coast. This contingency may arise from the great comparative difference between the value of coal and petroleum in New York and San Francisco.

A knowledge of the composition of different kinds of fuel will enable us to arrive at a tolerably definite conclusion as to their various calorific powers. The steam-generating power of any other kind of fuel is usually reckoned by the amount of water which any given weight will evaporate, starting from the boiling point. Numerous, careful experiments have established the following facts:

One pound of the best anthracite or carbon will evaporate 15.5 pounds of water; one pound of hydrogen will evaporate 64.2 pounds of water. This, of course, involves a perfect combustion of every particle of the fuel. One pound of carbon, in burning, unites with only 2½ pounds of oxygen, while one pound of hydrogen, in burning, unites with eight pounds of oxygen. The greater amount of oxygen which in the latter case enters into combustion accounts for the greater amount of heat developed.

If we could obtain hydrogen as cheaply as we can carbon, we could make steam with that substance for less than one-quarter the cost of making it by coal. That, however, in the present state of human knowledge, being an impossibility, the best we can do is to obtain the two substances in their most favorable state of natural combination as we find them in the earth, as crude petroleum. We find this substance abundantly in the proportion of C¹⁰H¹⁶; in other words, twenty atoms of carbon combined with sixteen atoms of hy-

drogen. Now an atom of carbon weighs six times as much as an atom of hydrogen; hence we have our crude petroleum, when reckoned according to the specific gravity of its component parts, as six carbon to one hydrogen. Consequently, when we burn one pound of petroleum, its theoretic comparative work may be expressed thus: 6.7×15.5+1.7×64.2=22.49 pounds of water evaporated by one pound of petroleum, against 15.5 pounds which can be evaporated by the best coal. Metcalf, in his work on Caloric, gives the relative proportion, by weight, of the carbon and hydrogen in crude petroleum, or petroleum, as carbon, 88.5, hydrogen, 11.5. This would slightly vary the above, so as to make the result stand 21.09 pounds of water as the evaporative power of one pound of petroleum.

Our petroleum experimenters claim that they are able to effect a complete combustion; while in the best coal furnaces for making steam, it is well known that there is a loss of twenty per cent. of coal in cinders, ashes and waste gases. Hence there must be deducted from the practical work of coal about one-fifth of 15.5, which will leave but 12.4 as the practical evaporative power of that fuel, against 22.49 as the work of petroleum. Consequently, the practical heating power of petroleum is 1.814 times greater than that of coal.

Having arrived at the relative evaporative power of the two fuels, let us now look at their comparative cost. The crude petroleum, from Santa Barbara, can be delivered in this city, in bulk, just as soon as there is a large and constant demand for the same, at a cost which need not exceed \$20 per ton; while anthracite, delivered here, costs \$23. These figures, considered in connection with 1.814, the heating power of petroleum, as above given, show that, with proper conveniences for the transportation of petroleum, steam can be generated here, by that fuel, fifty per cent. cheaper than it can be done with coal.

Zinc to Improve the Action of Quicksilver.

It seems not to be generally known that zinc with quicksilver—about one ounce or less to ten pounds of quicksilver—increases the retentive efficiency of the quicksilver for gold and silver to a remarkable degree. This may be attributed to the rough and barbed edges peculiar to the fracture of cast or semi-fluid zinc; similar to the state in which it appears in the amalgam.

Some similar action is effected by sodium amalgam, by the use of gritty silver for amalgamation of battery aprons, and finally by the use of amalgam, rich in gold, in astra, batteries and pans. In either case the effect is superior to that of plain quicksilver, the surface of which, by its smoothness, offers less resistance. Zinc, of all metals, exhibits the strongest inclination to this peculiar barb-like crystallization. Even in the melted condition, the passage between the particles is far from smooth; but rather, as it were, bristled with innumerable barbed hooks, which grapple the gold and silver, instantly taking it up from any substance passing through it; and to this peculiarity may be traced the extraordinary retentive faculty of the melted zinc, for gold and silver, far surpassing that of any other substance in existence. Millmen will find it of great advantage to use zinc with their quicksilver. The use of it in this manner is not patented, but has been employed in Mexican mines, and is therefore free to all. It requires only to be known to be appreciated. One dollar's worth of zinc saves pounds of gold and silver.

It should be remarked that it does not injuriously affect the bullion, for in melting this into bars the zinc is volatilized.

R. D'HEUREUSE.

CONTINENTAL Life Insurance Company,
302 Montgomery street, corner of Pine.

Foundry and Machine Work—The Aetna Works.

The improvement in foundry and machine work is more and more perceptible as the season advances. All the various establishments appear to be quite busy at the present time. There will not be so much quartz machinery ordered this summer as in past seasons; although there will be a more general employment of the machinery already at the mines than ever before. Miscellaneous orders, however, for sawmills, flour mills, etc., are somewhat in excess of former years. Many new mills are being erected, and a large number of old mills are putting in new or additional machinery. There is also an important improvement in the demand for architectural castings. Iron is rapidly coming into very general favor for building fronts in this city. Its cheapness, durability and beauty all combine in its favor.

The Dooley Block, now in process of erection, adjoining the Cosmopolitan Hotel, Sansome street, presents some new features in this line of work. The castings for this structure are from the Aetna Foundry, the proprietors of which, we understand, are about to apply for a patent for a new and improved method which they have devised for molding arches. This block will cost very nearly \$100,000. The lower portion will be occupied for stores, while the upper stories will be connected with the Cosmopolitan, and form a portion of that extensive hotel. They have also just completed the iron front for a block at the southwest corner of California and Battery streets; and are about commencing work for another front on the southeast corner of Sansome and Bush streets, where Mr. Charles Land is about to erect a new block. About 100 tons of iron will be required for this work.

While passing through the Aetna Works, a few days since, we noticed among other descriptions of work in process of completion, an engine for a new sawmill, now being erected by McPherson & Wetherbee, lumber dealers of this city, at Noyo River. Also a 10-stamp quartz mill, with engine and boiler, for parties in this city, which will be put up at a mine in Siskiyou county. We are pleased to note that the stamp-stems and shafting for this mill have all been forged at the Pacific Forge Co's Works, on the Potrero. These are the first stamp-stems which have been forged on this coast. The stems heretofore employed have been of rolled iron, brought from the East. Those to which we now refer, have been forged from the bloom. Forged or hammered stems are much stronger, and more durable than those which have been rolled. The extra cost is but a trifle, compared to the advantage gained in durability. It is an important step in the progress of mechanical operations in this State that we have recently become quite independent of the East for nearly everything in the way of forging. The rolling works, also under the same management, are rapidly approaching completion, so that we shall soon be able to add still another heavy and important branch to our rapidly increasing mechanical industries.

This establishment is also engaged in the manufacture of a new and improved steam feed-pump, the invention of W. W. Hanson, one of the proprietors. The design of this invention is to provide a pump which shall be just as effectual as the common feed-pump, but at the same time more simple and less liable to get out of order. The peculiarities of this pump consist in its being direct-acting, without crank or fly-wheel, with no dead center, and capable of being driven at any practicable speed. The steam cylinder, water cylinder, steam chest, valve, piston, piston-rod and plunger, comprise only four pieces.

The iron work for one of Hayes' Patent Fire Escapo ladders has just been turned out at these works. The wood work for the same

has been constructed by Black & Miller. A full description of this invention, with particulars of its practical trial, will probably be given in two or three weeks. It is now in the paint shop, receiving its finishing touches.

White's Patent Petroleum Burner, a California invention, recently patented through the agency connected with this office, will soon be applied to the boiler furnaces of these works.

They are also building three of Varney's new quartz grinders, which have been on trial in this city for several months past, and which appear to give very good satisfaction. The quartz is ground dry—not crushed—to an impalpable powder, so as to thoroughly free all the gold from the rock, and leave it in a most favorable condition for amalgamation. We also noticed a large amount of shafting, pulleys, etc., just completed, for the San Francisco Cordage Co. at the Potrero, which establishment is materially increasing the extent of its manufacturing facilities. We are pleased to notice that the Aetna folks have recently been obliged to increase the area of their foundry building, to accommodate the increasing demands for room at this establishment.

A LITTLE TOO FAST.—We find the following in Thursday's *Commercial Herald*:

"An article descriptive of a considerable quantity of type metal, from the Montezuma mine, Humboldt county, Nevada, was published in the *Commercial Herald* and *Market Review* of Dec. 28th, 1867. It was of much interest, and the details were obtained at the time from Faulkner & Sons, type foundry in this city. This article was appropriated, without credit, by the *Scientific American*, published in New York, and in course of time found its way back to this city, where it was once more republished by the *MINING AND SCIENTIFIC PRESS*, without credit to any one. On the 7th of this month, the *Bulletin* extracts some portions of the article and conscientiously credited the *MINING AND SCIENTIFIC PRESS* for our property, which we had prepared for our readers four months ago.

Some of the Atlantic commercial and financial journals have contracted the habit of appropriating our views and remarks, and reproducing them as their own. We confess to feeling rather flattered by their indorsement, but beg to suggest the propriety of doing to others as they would that others should do unto them, and while conferring upon us the honor of their approval, give us the credit which is our due. Money, time and labor are freely expended in the preparation of this paper, which is got up for the interests of California and the Pacific coast, in so far as the unvarnished truth will permit, and no further, and with which the interests of its proprietors are identified. We have felt more aggrieved on this occasion than usual, as the *Bulletin* is not a journal which quotes without giving to Caesar the things which are Caesar's, when it knows the just owner; but in this instance it should have known, and governed itself accordingly."

As soon as the reader has recovered his breath, he will please lend us his ear for one moment. The fact in the case is simply this. The article on type metal in our issue of May 2d,—the only one which we have published,—was prepared expressly for this paper by Mr. Nason himself, the Superintendent of the mine alluded to,—who chanced to be in town at that time. Upon reading the above, we sent to the *Herald* office for a copy of its December issue aforesaid, and carefully compared its "property, prepared four months ago," with the article in the *PRESS*. In one single paragraph, we notice a similarity in the wording; suggesting the probability that Mr. Nason,—from whom, by the way, some of the points in both cases doubtless originally came,—had the *Herald's* article in his mind at the time.

This is "the head and front of our offending." No paper is more scrupulously careful to give due credit, when using the language of another journal, than the *PRESS*. The *Bulletin* was perfectly right in crediting its extract to the *PRESS*. If the editors of the *Commercial Herald* had taken the pains to compare the two articles before rushing into print upon the subject, they would have seen that they were not the same. We advise our lively young friends to "look"—the next time—before they "leap."

PAINE & STEPHENS' IMPROVED CONCENTRATOR,

For Saving Gold and Silver Sulphurets.

This invention, a perspective view of which is given above, consists in applying machinery to the ordinary buddle, and rendering the same automatic in action. It is calculated to do a large amount of work.

One Machine, costing about \$1,400, is sufficient to work the Sands from 25 to 30 Stamps. But very little power is required.

It can be easily run by one man turning a crank. The principle on which it works is entirely dissimilar from any other machine now used on the Pacific Coast; although it is in almost universal use in Europe; but not so arranged there as to be automatic in action.

The illustration given herewith, was fully described in the *Mining and Scientific Press* of March 21, 1868.

One of these machines may be seen in constant operation at the Eureka (Watt's) mine in Grass Valley, where it is giving the fullest satisfaction, and is working all the tailings from thirty stamps. Another machine may be seen at the Banner mill, in Nevada, and a third below the Gould & Curry Company's mill, near Virginia City.

For further information, apply to THOMAS N. PAINE, Grass Valley, California.

PAINE & STEPHENS.

13v16eow

CRYOLITE.—We would further inform our last week's correspondent "Smelter," in regard to the mineral named above, that a company in Western Pennsylvania has within two years imported 9,000 tons into Philadelphia, for use in the preparation of soda and its salts, and of sulphate of alumina. Another company is about to carry on the manufacture of "hot cast porcelain" from it. By fusing it with silica, a beautiful glass, stronger than ordinary flint glass, is made, which will probably furnish the material of many utensils for chemical and pharmaceutical use.

Foundry and Iron Works.

HINCKLEY & CO.,

MANUFACTURERS OF

STEAM ENGINES,

Quartz, Flour and Saw Mills,

Hayes' Improved Steam Pump, Brodie's Im-
 proved Crusher, Mining Pumps,
 Amalgamators, and all kinds
 of Machinery.

N. E. corner of Tehama and Fremont streets, above How-
 ard street, San Francisco. 3-qy

BAURHYTE, McAFEE & SPIERS,
BOILER MAKERS
 AND GENERAL MACHINISTS,

Howard st. between Fremont and Beale, San Francisco.

Flue or Tubular Boilers, with plain circular or spiral
 conical. Upright Flue or Tubular Boilers, Locomotive and
 Marine Boilers, and Wrought Iron Tanks of every de-
 scription.

Hydraulic Pipe supplied at reasonable rates. In or-
 dering, give the quantity of water to be supplied, height of
 the fall, and total length of pipe, so as to enable the firm to
 determine the diameter of the pipe and thickness of iron to
 be used.

Repairs.—Boilers, Smoke Stacks, Pipes, etc., put in re-
 pair with promptness.

To Boiler Makers and Machinists in the In-
 terior.—The firm is prepared to furnish estimates of
 Boilers, supply new Heads, drilled and punched, and attend
 to the erection and forwarding of iron for Boilers, Pipes,
 and other purposes.

Plans, Drawings and Specifications.—The firm is
 prepared to make out Plans and Specifications, receive
 estimates, and superintend the erection of any Machinery
 that may be entrusted to their care.

To Inventors.—The firm is prepared to assist in de-
 veloping the plans of those who have the ideas, but not the
 practical experience necessary to put the same in form, by
 making Drawings of their Inventions, giving them the ben-
 efit of their practical knowledge in the construction of Ma-
 chinery, and attending to the manufacture and introduc-
 tion of their Inventions. 14v16f

Pacific Iron Works.

First and Fremont Streets,
 SAN FRANCISCO.

Having been established since 1841, we have accumulated
 a very large variety of Gear and other Patterns, which,
 with our superior tools and appliances, give us facilities for
 doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine
 use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

Including High and Low Mortars, for wet or dry crushing;
 Furnace Irons for Roasting Ores; Freiberg Barrels;
 Varney's and Wheeler's Amalgamating Pans
 and Settlers; Stamp Shoes and Dies of
 best White Iron; Russia Iron
 Screens etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety;
 Pumping and Hoisting Machinery; Hansbrow's
 Patent Challenge Pump, for Domestic,
 Ship and Mining use—the most
 approved and successful
 Pump manufactured.

Castings of every description, Iron and Brass.

We would call special attention to "Wright's Patent Va-
 riable Cut-off Engines," of which we are the sole manufac-
 turers on the Pacific Coast, under license from the Wood-
 ruff & Beach Co., Hartford, Ct. As a simple, effective, fuel
 saving, first-class Engine, this is, without doubt, the best
 Engine made in the United States.
 Orders promptly attended to. Prices as low as possible
 for first-class work, and we intend to do no other.

San Francisco, May 1, 1868. **GODDARD & CO.** 13v16f

To the Mining Public.

THE SUBSCRIBER HAVING SERVED FOR THE LAST
 twenty years as Superintendent for various Companies,
 working mines of Gold, Copper, and Argenteous Galena,
 offers his services to examine and report upon mines and
 mineral property. Reports accompanied by Plans, Sections
 and other Drawings. Also would be willing to take
 the management of any legitimate mining enterprise. If
 necessary, satisfactory references can be given.
 14v16f **H. H. SLEDGE, Copperopolis, Cal.**

TRANSFERRING CARBON PRINTS.—Swan's
 process for transferring carbon prints is
 thus described in the Philadelphia Photog-
 rapher: A solution of gelatine one part,
 water eight parts, and glycerine one-fourth
 of a part, is first made, in which the pic-
 tures are completely immersed along with
 a piece of fine tissue paper. They are taken
 together out of the solution, when they will
 adhere quite firmly to each other. They
 are now dried, and with benzine it is easy
 to separate them from the fine paper and
 paste them, or else paste the whole on card-
 board and then separate. Dr. Vogel has
 made some successful attempts to transfer
 carbon prints to glass. For this purpose
 the developed carbon print which still rests
 on the caoutchouc paper, is floated on a so-
 lution consisting of gelatine 12 parts, gly-
 cerine 3 parts, and water 100 parts. Next
 on the warm plate of glass a little of the
 above solution is poured; the picture is
 laid on this, and the surplus of the gelatine
 is removed by pressure with the fingers;
 when nearly dry the picture is brushed
 over in order to tan it, with a solution of
 one part of chromate of iron in 300 parts
 of water; after this it is allowed to dry com-
 pletely, and is then, by means of benzine,
 dissolved off. On opal glass these pictures
 are very pretty, particularly when the tissue
 is of a brownish tone. These positive car-
 bon prints on glass may become import-
 ant in the future, for it is easy to make
 from the positive carbon print on glass a
 negative carbon print on glass also, and
 thus we would have the means of supply-
 ing negatives and giving the latter a per-
 manence equal to the carbon print.

LAKE MICHIGAN—CURIOUS FACTS.—The
 Chicago Times of March 26th says: "The
 water in Lake Michigan is said to be five
 inches lower than has been known before
 for 18 years, and 30 inches lower than it
 was six years ago. This calls to mind some
 curious facts in regard to the rise and fall
 of the lakes. It has been ascertained that,
 with considerable regularity, there is a pe-
 riodical ebb and flow in the lake, the water
 rising gradually from seven to nine years,
 and subsiding in the same manner, while,
 at long intervals, the waters reach an un-
 usually high and low stage, exactly corres-
 ponding with the rise and fall of the waters
 of the sea at the spring tides.

Another noticeable fact is that, in the
 spring, at a period when the discharge into
 the lakes is the greatest, and when they are
 least affected by evaporation, the water is in-
 variably the lowest. In the fall, after the
 subsidence of the spring freshets, and when
 under the full effect of the summer's
 droughts, and after the evaporation has
 been the greatest, it is found that, instead
 of any abatement in the volume of water
 in their basins, there has been a gradual
 rise during the entire summer. These are
 the facts, and, although they have engaged
 the attention of scientific men, no solution
 has yet been reached. It has become ap-
 parent that the lakes are not affected by
 freshets, droughts or evaporation. But
 whether these phenomena are the effect of
 subterranean channels and outlets, a sort
 of mystic connection which brings the lakes
 within the influence of inter-oceanic cur-
 rents, is still an unsolved problem.

WOODEN VISITING CARDS.—Abbot R.
 Davis, of East Cambridge, Mass., has taken
 out a patent for what perhaps will come to
 this. His claim reads as follows:

"I take a log of wood of any suitable
 description, and cut it by machinery into
 thin sheets or laminae, in a well-known man-
 ner, after which they may be bleached or
 not, as desired. I then paste two of these
 sheets together, the direction of the grain
 of the upper sheet crossing that of the
 lower sheet, and submit them to heavy
 pressure by passing them between rolls,
 thus destroying the rigidity and condensing
 the fibers and closely uniting the two sheets
 together so as to avoid any liability of bend-
 ing, twisting or breaking the strip, and
 leaving its upper and lower surface with a
 smooth, hard finish, suitable to print upon.
 The strip may now be cut up into cards of
 the required size. If a highly polished or
 artificial surface is required, it is simply
 necessary to apply an enamel of the desired
 color, in a manner similar to that put on to
 ordinary cardboard. Cards made as above
 described, ready to be printed upon, may
 be furnished at about one-eighth the cost
 of those made from the materials hereto-
 fore used for the same purpose."

Give the Brazilian Pebble Spectacles a
 trial at C. Mullers, 205 Montgomery street.
 They keep the eye cool, and never fail to
 improve the sight. *

ROSTING OF IRON.—Fayen determined that a saturated solution of potassid lye, when diluted with from one thousand to two thousand parts of water, will protect iron from rusting in water. Saturated lime water, when diluted three times, will do the same, but not if diluted four times. Saturated carbonate of soda, diluted with from fifty to fifty-four times its bulk of water, will also protect iron, but not when diluted with fifty-nine times. Fine cast steel requires less potash for its protection.

THERE is not a paper mill in Greece, and the supply of paper is imported from Austria, Italy and France.

THE GOLDEN ERA.

Founded in 1832, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent.

THE GOLDEN ERA

Is the most universally popular of all the Weekly Journals. It presents forty-eight columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected matter. It is a welcome guest in Cottage and Cabin; the favorite at the fireside in city and country; the most useful, agreeable and altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe and elsewhere. Every household in the mountains and valleys, the cities, towns and mining camps of California, and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor. Inquired with the genius of the age, it is progressive, and aims not so much at distinction as a newspaper, as at honorable success in its capacity of a great Moralizing and Improving Influence. Exercising a positive power for good, and wielding a permanent influence, many able and eminent writers choose its columns as a means of communicating with the public. No effort will be spared to make it a thoroughly California newspaper, and worthy of the support of all classes of our citizens.

MOSHEIMER'S

Pioneer Mining School,

ASSAY OFFICE

-AND-

Metallurgical Works,

SAN FRANCISCO.

Having established the first Practical Mining and Metallurgical School in the United States, I would call the attention of gentlemen who may wish to obtain a practical knowledge of Chemistry, Metallurgy, etc., to the fact that I am now prepared to teach the following branches:

- 1.-Assaying of Ores, Metals, and other Mineral Substances.
- 2.-Metallurgy of Gold, Silver, Copper, Lead, etc., by Smelting, Amalgamating, Lixiviation, etc.
- 3.-Gold Extraction, by Chlorine Gas; also, a modified process of the same, which is cheaper and quicker than the processes usually employed.
- 4.-Concentration.-Dressing of Ores.
- 5.-Construction of Furnaces, in which any kind of fuel may be used for Smelting, Roasting, etc., as well as the erection of any Machinery or Apparatus required in Metallurgy and Technology.
- 6.-Technology, or Chemistry as applied to any special branch of Manufacturing.

By my Practical Mode of Teaching, any person of ordinary ability can learn to assay Ores in three lessons, and the working of all the ordinary and refractory ores in a few weeks.

Gentlemen of almost every profession, who, within the last two years have graduated at my establishment, will bear testimony that from my instructions they have learned more in a few weeks than they ever expected to learn.

My charges are from \$50 to \$200.

Ores of every description assayed and worked
JOSEPH MOSHEIMER,
Pr. Chemist, Metallurgist, C. E., etc.

THE BEST IN AMERICA.

The Mining and Scientific Press,

Is the Largest and Best MINING AND MECHANICAL

Newspaper issued in the United States.

DEWEY & CO.,

Patent Agents, Publishers, Book and Job Printers, 505 Clay Street, San Francisco.

THE MINING AND SCIENTIFIC PRESS is published every Saturday. Each issue contains sixteen pages (64 columns), and furnishes more valuable reading matter than any other weekly journal in California.

To the practical mechanic, metallurgist, prospector, millman, mine holder or worker, it is worth many times its subscription price. Its files contain a record of the improvements in mining machinery, the progress and development of the mines, and all new methods and processes for working and

SAVING PRECIOUS METALS.

All progressive information, in fact, transpiring with the times—which cannot be obtained from books.

The Mining and Scientific Press is now in its Sixteenth Volume, and enjoys a large circulation. It received the following hearty endorsement of the California Miners' State Convention, held at Sacramento, January 17th, 1886:

RESOLVED, That we regard a mining paper or journal of great importance to the mining interests of California, and recommend the Mining and Scientific Press, of San Francisco, to the consideration and support of the miners of the Pacific coast.

Terms of Subscription.—One year, \$5; six months, \$3; in advance. Send for sample copies. Remittances may be made by mail at our risk, if parties sending will register their letters, or send money order.

AS AN ADVERTISING MEDIUM throughout the whole Pacific States and Territories, the Press is unsurpassed. Rates moderate.

SPECIFIC NUMBERS OF THE PRESS and Patent Circulars, sent free.

DEWEY & CO.,

Economy in Advertising.—The Mining and Scientific Press is the best and most economical mining advertising medium in this city. Our terms are less than one-half the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The Press contains, proportionally a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

ELECTROTYPING, ENGRAVINGS, Etc.—Our Job Printing Office is abundantly supplied with elegant engravings, ornaments, and other embellishments to suit the various branches of industry in this State.

New Mining Advertisements.

Adella Gold Mining Company, Rock Creek,
Sierra County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the thirteenth day of May, 1898, an assessment of one dollar (\$1) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, 318 California street, up stairs, San Francisco.

Any stock upon which said assessment shall remain unpaid on the nineteenth day of June, 1898, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the sixth (6th) day of July, 1898, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. M. BUFFINGTON, Secretary.
Office, 318 California street, up stairs, San Francisco. my16

Chilpaneca Mining Company—District of Ures,
Sonora, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the eleventh day of May, 1898, an assessment of five dollars (\$5) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, 318 California street, up stairs, San Francisco.

Any stock upon which said assessment shall remain unpaid on the nineteenth day of June, 1898, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the sixth (6th) day of July, 1898, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOHN F. LOHSE, Secretary.
Office, 318 California street, up stairs, San Francisco. my16

Great Central Mining Company—Location of
Works: Yuma County, Arizona Territory.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fourteenth day of May, 1898, an assessment of one dollar per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company.

Any stock upon which said assessment shall remain unpaid on the nineteenth day of June, 1898, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the sixth (6th) day of July, 1898, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

And in accordance with law, and an order of the Board of Trustees, made on the twenty-fifth day of March, 1898, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the Company, by Jones & Bendixen, auctioneers, on the eighteenth day of May, 1898, at the hour of 2 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

D. H. CROWE, Secretary.
Office, No. 223 Clay street, San Francisco. m2

I. X. L. Gold and Silver Mining Company—Location
of Mine: Silver Mountain District, Alpine County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fourth (4th) day of May, 1898, an assessment of one dollar and fifty cents (\$1.50) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, Pioneer Hall, (up stairs) Montgomery street, near Jackson, San Francisco.

Any stock upon which said assessment shall remain unpaid on the thirteenth (13th) day of June, 1898, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the first day of July, 1898, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. CROWNINSHIELD, Secretary.
Office, Pioneer Hall, Montgomery street, up stairs, San Francisco. my9

Joe Lane Gold and Silver Mining Company,
Lander County, Nevada.

Notice.—There are delinquent, upon the following described stock, on account of assessment levied on the twenty-fifth day of March, 1898, the several amounts set opposite the names of the respective shareholders, as follows:

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the
PACIFIC FOUNDRY,
1st
San Francisco.

SUPERIOR CUT-OFF ENGINES.

We desire to call the attention of Engineers, Manufacturers, and Millmen, to the celebrated

Hartford Engine,

With Wright's Patent Variable Cut-off, which we are now manufacturing under a license from the Woodruff & Beach Iron Work Co., Hartford, Ct. To parties wishing a First-class

Fuel-Saving Engine,

Simple and durable in construction, this Engine is offered in the belief that it is superior to any other manufactured. It enjoys the very highest reputation in the Atlantic States, where it is well known; over 300 of them having been built by the Woodruff & Beach Company, and being now in successful operation.

—BY—

WM. P. BLAKE,

Corner First and Mission streets, or Box 2,077
3v13f SAN FRANCISCO.

NOTICE TO MERCHANTS

—AND—

MANUFACTURERS.

Moore's Patent Friction Hoist.

Now in successful operation in the principal stores in San Francisco, possesses many advantages over the common Hoist—viz: Greater strength, less danger, to working, as goods require no slinging or landing, consequently make fewer breakages; requires one man less to operate it; stops with the load at any point, without any lashing or attention from the operator.

The undersigned take this opportunity to notify all whom it may concern that they have secured, by letters patent, the application of a friction pawl, or stop, to hoisting machines, and that they will prosecute any party making or using any machine infringing upon the same.

Brodie's Patented Improvements

FOR THE TREATMENT OF

Gold and Silver Ores.

BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and fitness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms: No. 1.—Or 8 inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price.....\$600 No. 2.—Or 15 inch Crusher, capable of similarly putting through five to six tons per hour.....1,500 No. 3.—Or 18 inch Crusher, will in a similar manner crush from seven to eight tons per hour.....1,200

EXPLANATION OF THE ABOVE ENGRAVING. The frame is made of cast iron, bolted with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the mevable jaw, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the opening. F, which can be regulated at pleasure, so as to graduate to the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, B, moves the mevable jaw, B, forward and downward method at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne County: "RAWHIDE RANCH, Tuolumne Co., Sept. 28, 1866. JAMES BRODIE, Esq., San Francisco—My Dear Sir: It gives me pleasure to inform you that I have for the past three months had one of your largest sized Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which has entirely met my expectations; and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly, R. P. JOHNSON, Supt. Rawhide Ranch Quartz Mill."

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers. For the present it is not intended to grant licenses for the use of the Improved German Barrel, for a longer term than twelve months. All persons desirous of procuring, without having recourse to legal proceedings, for past infringements, or desirous of receiving Letters of License for the limited period named, are requested to address as below. A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866. JAMES BRODIE, Esq., Fulton Foundry, or CHARLES RAGLIER, Express Building, 402 Montgomery street, San Francisco.

Mechanical Drawings.

Persons wishing Mechanical Drawings can obtain the services of competent draughtsmen, by applying to this office

COMPOSITION FOR ARTIFICIAL TEETH.—

One part of very finely pulverized glass is mixed with three parts of finely ground oxide of zinc, which has been previously submitted to red heat, in order to expel all the carbonic acid and water it may contain. Then one part of borax is dissolved in the smallest possible quantity of hot water, and the solution added to 50 parts of a very concentrated solution of chloride of zinc (specific gravity 1.5 to 1.6). The mixed powder of glass and oxide of zinc is then moistened with enough of the above solution to form a homogeneous paste, which must be used immediately, as it hardens in a few minutes. The borax is only added to retard the solidifying of the mass. By addition of small quantities of ochre, the lighter and darker shades of the teeth can be imitated. When the mixture is completely solid, it is fully as hard as marble.

ANOTHER COMPOSITION—SAME PURPOSE.

The enamel of the teeth of oxen,—or still better of carnivorous animals,—is exposed to red heat, until the carbonate of lime contained in it is changed into caustic lime; it is then ground to the finest powder. To this, water is added, drop by drop, so that hydrate of lime is formed; and then by gently heating it, the superfluous water is expelled. This dry powder is now mixed with phosphoric acid of the consistency of syrup, to form a thick jelly; and then, as quickly as possible, some hydrate of lime in powder is added, until it forms a stiff paste. The operation must be performed quickly, as the mass hardens in a few seconds. The more lime added, the more durable the mass will be; but the more quickly the hardening takes place. If more phosphoric acid is used, it remains longer in a soft state, but is less durable. The lime should be chemically pure,—since alumina and silica prevent the intended union. A little magnesia causes the mass to remain soft longer, even if more lime is added; but the presence of magnesia is not desirable,—since the phosphate of magnesia will partially dissolve in water. It is not well to use the lime immediately after being slacked; it must have stood for some time. It does not matter if it has attracted a little carbonic acid from the air. Likewise, the phosphoric acid should not be used soon after being heated, dissolved or diluted. The best is the glassy phosphoric acid, after its spontaneous liquefaction. It should be of the consistency of syrup; or contain so much water, that the water of the acid together with that of the hydrate of lime, may correspond to the formula,—2 equivalents of lime + 1 phosphoric acid + 4 equivalents of water; allowing for the water which evaporates in consequence of the heat generated by the union. The mass will be still more solid, if some hydro-fluoric acid is added to the phosphoric acid; the mixture after standing a few days is to be treated as above directed.

RUSSIAN RAILWAY COMFORTS.—The train from Moscow to St. Petersburg, which runs on the first line ever laid down in Russia, usually consists of half a dozen cars of immense length. Entering by a broad, easy staircase and convenient platform, a person finds himself in a saloon, with a table in the center, surrounded by sofas and divans. Opening from one side of this saloon is a passage leading to the further end of the carriage, and passing on to an iron platform outside. Heavy curtains, pushed aside, reveal three apartments, each furnished with six easy chairs. Another passage leads to similar apartments reserved for ladies. A staircase shows the way to a sleeping saloon above. Double windows exclude the bleak air of the steppe from rushing directly in upon weak lungs; but there is so good a system of ventilation through the roof that the cars are never unpleasantly close. Lastly, there are washing places, dressing-rooms, and other conveniences handsomely fitted up and scrupulously clean. The amusements are numerous and varied. Portable card tables, wax candles, chess, draughts, cards and books are to be had for the asking.

SINGULAR DISCOVERY.—The Chattanooga Union says that Mr. William Staples, while digging recently in a salt lick on his farm, twelve miles northeast of Kingston, Tenn., struck a solid limestone rock, about seven feet below the surface. He found in it a well, about eight inches in diameter, filled with very salt water. After the discovery of the well, Mr. Staples prosecuted his investigations, and to his surprise, found a line of salt kettles, or rather the remains of salt kettles. The kettles were of stoneware, and about forty in number. Growing above them were trees—poplar and oak—which were evidently two centuries old.

FERTILIZERS.—From a discussion upon this subject, reported by the Manchester Mirror as having been held at a recent meeting of the Bedford (N. H.) Farmer's Club, we extract the following: The chairman (Col. George W. Riddle) remarked that a crop of green clover upon an acre, estimated at a ton after it is cured, would be worth, standing, \$10 for hay; if turned under, would be of as much value as a fertilizer as four cords of stable manure, costing \$48. He considered it the best and cheapest method of enriching the soil. * * A gentleman present stated the analysis of a fair average of barnyard manure, by Dr. Nichols, editor of the Boston Journal of Chemistry, and a practical farmer. It was found that, assuming a cord of manure to weigh 3,000 lbs., nearly 2,500 lbs. of it was simply water, more than 100 lbs. sand, and more than 300 lbs. of the balance of no more value than muck, straw or chaff—leaving only 74 lbs. of active fertilizing material, which might be carried in an ordinary basket upon the shoulder to the field. Barnyard manure may be imitated by thoroughly composting with a cord of seasoned meadow muck, 65 lbs. of crude nitrate of soda, two bushels of wood ashes, one peck of common salt, ten lbs. of fine bone meal, two quarts of plaster, and ten lbs. of Epsom salts. It will not cost \$3.50 the cord, and ought to serve as good purpose as animal manure.

CURIOUS DISCOVERY IN CHILE.—The Valparaiso Correo de la Serena relates the following:

We have been informed that at the summit of the Cordillera de Doña Ana, the priest Don José Sagnes, following an ancient track, has discovered a deposit of curious objects. At an altitude of 10,000 feet, a small excavation has been made, from which have been taken a lmanaco made of bone and ornamented with gold, a silver figure weighing three pounds, and another representing an Indian at the time of the conquest. They were all found under a kind of shed made of wood and covered with stones, charcoal, and human wool in a perfect state of preservation.

ELECTRIC TEST FOR OILS.—M. Rossean, discovered that olive oil, the feeblest conductor of electricity, when mixed with one-hundredth of its volume of oil of poppies, increased the number of vibrations of a magnetic needle in a given time, when the same was made to form parts of an electric current. Mr. Warner, an English experimenter, has enlarged the field opened, and shows that difference of resistance will show the purity of oils. He gives a table of resistance of volatile and fixed oils, and as turpentine and alcohol are the principal adulterants of volatile oils, and as the former has an immense resistance and that of the latter is enormously lower than any of them, the variation in the deflector compared with that given in the tables, will detect and show the extent of adulteration.

TRIAL OF SKILL.—The St. Johns (N. B.) News says: A trial of skill between English and American telegraph operators recently took place, the object being to ascertain which is the most expeditious method. So far, we have tidings only of results on this side. The trial over the wires of the Western Telegraph Company, from Washington to Cape Breton, a distance of about 13,000 miles, was very satisfactory. Ninety-four messages, averaging twenty words each, were transmitted over a single wire in an hour. Better time has, however, been made on shorter circuits. On the same night, twenty-three messages were sent from Plaster Cove, Cape Breton, to New Orleans, a distance of 2,700 miles, in thirty minutes.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

A NEW WORK

—ON THE—

Mining and Metallurgy

—OF—

GOLD AND SILVER.

BY J. ARTHUR PHILLIPS.

This is a large royal octavo volume of over 500 pages, illustrated with numerous plates descriptive of Mining Machinery and Mining Operations.

It should be in the possession of every Miner and Metallurgist on the coast.

For sale by

H. H. BANCROFT & CO.,

Dealer in Mining and Scientific Books,
San Francisco, Cal.

ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.

Awarded the First Premium at the Paris Exposition.

ADAPTED
FOR

Smelting,
Foundry,
Mining
and
Steamships.

REQUIRES
Fifty Per Cent.

LESS POWER
Than any Blower
now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver mine; Gridley's Foundry, Gold Hill, Nevada; Aetna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

For Circulars and further information, address

KEEP, BLAKE & CO.,

Globe Iron Works, Stockton, Cal.

Nos. 17 and 19 Front street, San Francisco, and 9, 11, 13 and 15 J street, Sacramento.

Wood & Mann's Portable Steam Engines, 6, 8, 10, 12 and 15 horse power,

With newly invented Water Bottom, which entirely surrounds the fire grate and ash-pit, forming underneath the ash-pit, as up to the sides of the furnace, a three or four inch water space, by which additional heating surface is obtained, the accumulation of sediment around the fire-box or furnace is entirely prevented, and renders it perfectly safe to use near any barn, or in any yard, or in any building where a stove would be allowed, as no sparks can possibly escape from the furnace or ash-pit. The sediment has a free passage to the bottom of the fire-box, and can be blown off daily by the blow-off cock underneath the ash-pit, by which means the boilers may be kept clean much longer than under the old system. The great saving in repairs which is effected by the use of these water bottoms, and the constantly increasing demand for them, prove their superiority to any others yet constructed.

HOADLEY'S THRESHING ENGINES,

HITTINGER & RAWSON'S IMPROVED HOISTING ENGINES, 6, 8, 12 & 20-horse power.

SUBSCRIBERS who do not receive the Mining and Scientific Press in due time, are requested to inform the publishers.

CREAM TARTAR.—The Lauer Manufacturing Co., New York, are now preparing a cream tartar which is said to approximate in all its qualities, to the purest imported article. It is recommended for its strength, healthfulness, and its beautiful whiteness. It is prepared by a new and simple process of chemical transformation, patented by Mr. John E. Lauer, and represented as especially adapted for baking purposes. Messrs. Hecker & Bro., the largest self-raising flour makers of New York, after a thorough trial, have purchased the right to use it exclusively in their business, believing it better adapted to their purposes than any other article in the market. We learn from Mr. William B. Hooper, 405 Front street, sole agent for California, that it is nearly 50 per cent. cheaper than the imported, of the same strength and quality.

PRESENTATION.—Mr. Morgan, the late Superintendent of the far-famed Hayward mine at Sutter Creek, Amador County, was formally presented by the "employés" in said mine, on occasion of his recent retirement, with a splendid gold-mounted meerschau pipe, made for the occasion, at a cost of one hundred and fifty dollars. The day was duly honored among the citizens of the place by a supper and ball. Mr. M. has held his position for twelve years, and was universally popular.

DISEASES OF THE EYE.—During a late visit to San Francisco, we fell in with an old acquaintance from this county, Mr. G. W. Purdy, who formerly resided at Forrest City. About two years ago, while under treatment, we saw Mr. Purdy at the office of an oculist in that city, with eyes badly inflamed and the sight entirely lost. We saw him a few months later at another physician's, but his case was scarcely improved, and seemingly hopeless. His eyes have now entirely recovered, so that he goes about his ordinary business. From his own lips we learned that the restoration of his sight was entirely due to Dr. D. R. Morgan, whose office is at No. 627 Sacramento street, between Montgomery and Kearny, who cured him in the short space of eighteen weeks. Mr. Purdy mentioned several remarkable cures which occurred in the practice of Dr. Morgan during the time he was under treatment, among which was that of Mrs. Jane Albert, of Brownsville, Yuba County, and several others. Mrs. Albert had been afflicted with sore eyes from early childhood, and for eleven months previous to treatment she had not been able to discern light, nor had she seen the features of her youngest child, twelve months old. She had heard of the remarkable cure of Leonard P. Eder, of Marysville, and Joseph E. Haskell, of Sacramento, and determined to try Dr. Morgan. The result was that she was able, after ten days, to read ordinary newspaper print. Mr. Purdy was of course greatly rejoiced at the recovery of his sight, after so many trials and failures with different physicians.

The above is clipped from the *Mountain Messenger*, of February, 1863. 10-16 Sin

SAVE YOUR TEETH.—Mrs. Jessup & Beers, over Tucker's jewelry store, are now making a specialty of filling the fangs of dead teeth, and building up broken crowns with pure gold—thus restoring them to their original usefulness and beauty. They are also using Nitrous Oxide for the painless extraction of teeth, when so desired—the only absolutely safe anesthetic ever discovered. In breathing it, it acts as a gentle stimulant, without undue excitement—the sensation produced being truly delightful, the effect upon the lungs healthful, and in its results positively free from all danger. Prepared and administered daily at the Dental Rooms of Messrs. JESSUP & BEERS, corner Montgomery and Sutter streets, San Francisco. 16-161F

HEADQUARTERS FOR HOMESTEAD LOTS.—At Messrs. Dun, can & Co's salerooms you will find maps and plans of the Folsom and Howard street lots, at \$300, in payments of \$30 per month. Lots on Eighteenth and Nineteenth streets, at \$300, in payments of \$30 per month; and lots of the City Land Association, at \$50, in payments of \$4 per month.

HENDY'S LATEST IMPROVED PATENT SELF-DISCHARGING SULPHURETS CONCENTRATOR.

FOR GOLD AND SILVER ORES,

With Revolving Stirrers and Rotary Distributor.

This machine is designed for saving finely divided Quicksilver, Amalgam and Gold from the sands, and for concentrating and saving the Sulphurets. Any person of ordinary experience with Quartz Mills can readily fit them up and run them.

Those in want of Concentrators would do well to visit some of the quartz mills that have Hendy's Patent Concentrators in use, and satisfy themselves before purchasing other Concentrators or pretended merit. **THEY ARE WARRANTED TO WORK SATISFACTORILY.**

Directions for Operating Hendy's Concentrators:

The sulphurets are drawn off while the Concentrator is in motion, in the following manner:

FIRST—In setting up, set the pan, A, level by the inner rim, near its center.

SECOND—While in operation, keep the Pan, A, about half full of sulphurets. [See Figure 2, marked S.]

THIRD—Open the gate, E, sufficiently to discharge the sulphurets as they accumulate over the amount above mentioned.

FOURTH—The crank shaft to make 200 to 220 revolutions per minute.

References:

Reference is made to the following mills, which have HENDY'S CONCENTRATORS in use:

EMPIRE MILL (8 Concentrators).....	Grass Valley, Nevada County.
NORTH STAR M. & M. CO. (8 Concentrators).....	Grass Valley, Nevada County.
NORRIDGEWOCK MILL (2 Concentrators).....	Grass Valley, Nevada County.
VALENTINE & CO., Commercial Mill (3 Concentrators).....	Nevada County.
HUMBOLDT CANAL CO. (1 Concentrator).....	Humboldt County, Nevada.
ROBINSON & McALLISTER M & M CO. (3 Concentrators).....	Hunter's Valley, Mariposa County.
PLYMOUTH ROCK MILL CO. (2 Concentrators).....	Calaveras County.
MIDAS MILL CO. (4 Concentrators).....	Virginia, Montana.
GOULD & CURRY G. & S. M. CO. (4 Concentrators).....	Virginia City, Nevada.
VULTURE CO. (8 Concentrators).....	Prescott, Arizona.
NOYES & CO'S MILL (2 Concentrators).....	Prescott, Arizona.
LUCY MINING CO. (3 Concentrators).....	Owyhee District, Idaho.
MOREY & SPERRY (1 Concentrator).....	New York.
GUADALUPE & SACRAMENTO G. & S. M. CO.....	Sinaloa, Mexico.
EL TASTE CO. (2 Concentrators).....	Sonora, Mexico.
B. F. BROWN (1 Concentrator).....	Melbourne, Australia.
JAMES HENTY & CO. (1 Concentrator).....	Melbourne, Australia.

And in use in many other parts of this coast.

The following give additional proof of the increasing popularity of the machine:

SAN FRANCISCO, October 10th, 1867.

J. HENDY, Esq.—Dear Sir:—To your request for an expression, in writing, of my opinion in regard to the merits of your Concentrator, I reply, that I consider it the best machine for saving quicksilver and amalgam, and for concentrating sulphurets, that I have ever used, or seen used. I may add, that I could give you no stronger proof of this than to order, as I did, six more of them, after a trial of one for several months. I shall take pleasure in showing the machine in operation to any one interested, who will call at the mill of the Empire Company, in Grass Valley. Yours,

S. W. LEE, Supt.

NORTH STAR MINE, Grass Valley, Feb. 26, 1868.

J. HENDY, Esq.—Dear Sir:—In answer to your request, I give my opinion in regard to the eight Concentrators we have at work. We have had one at work on blanket washings for the past three months, and it has proved highly satisfactory in saving sulphurets and amalgam, that in past years we have been losing. Of the other seven, six are taking the pulp from the batteries, and the remaining one concentrating from the six, which, when thus reconcentrated, yield 95 per cent. of pure sulphurets. Respectfully, etc.

W. H. RODD, Supt.

SUPERINTENDENT'S OFFICE, GOULD & CURRY S. M. Co., }
VIRGINIA CITY, Nev., Sept. 17, 1867. }

JOSHUA HENDY, Esq., San Francisco:—Dear Sir:—According to the terms under which I secured from you four (4) of your Concentrators, namely—that they were to be paid for only after a thorough trial had demonstrated their value—I desire to inform you that I have tried them, and have found them to work very satisfactorily, and that they will now be accepted by the Company. You will please present the bill for said Concentrators, say \$1,200, at the office of the Gould & Curry Company in San Francisco. Yours, very truly,

LOUIS JANIN, JR.

The bill was presented in accordance with the above request, and duly paid.

Four Concentrators have been forwarded to the Vulture mine, in Arizona, which makes eight for that mill. The additional order for four machines was made after a thorough trial, which proved their superiority over all others. [See Mining and Scientific Press of Dec. 14th.]

CAUTION.

All of HENDY'S PATENT CONCENTRATORS are marked thus:

"J. HENDY, Patented February 27th and April 17th, 1866."

Orders or letters of enquiry, address,

April, 1868.

SIXTH INDUSTRIAL EXHIBITION

—OF—

The Mechanics' Institute.

THE BOARD OF DIRECTORS OF THE MECHANICS' Institute hereby give notice that the Sixth Industrial Exhibition of that Association will be held some time in August next, in a building to be erected for the purpose, in Union Square, in this city. Every preparation will be made to accommodate exhibitors and visitors, with a view to make the Exhibition profitable, instructive and pleasant to all parties.

During the three years which have intervened since the holding of the last Exhibition in this city, the manufacturing, mechanical, scientific and useful and ornamental arts have made unprecedented progress on this coast, and it is believed that the proposed Exhibition will exceed any other in value that has ever been held on the shores of the Pacific.

The plan of building to be erected, which has been adopted by the Board of Directors, it is believed will prove to be the best adapted both for display and convenience of the public, of any building ever erected in the State. The building will be perfectly water-tight, being covered with a shingle roof, so that no damage from the elements can be anticipated.

All parties who are interested in any of the branches of Manufactures, Mechanics, or the Arts and Sciences, are invited to exhibit in the proposed Exhibition, and to share in the publicity and consequent profit which always attends such enterprises. Suitable premiums will be offered, and the specific date of opening the Exhibition will be published at some future time.

By order of the Board of Directors.

19-161F

HORACE D. BUNN, Cor. Sec'y.

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1863, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY, 2—CIVIL ENGINEERING, 3—MECHANICAL ENGINEERING, 4—MINING ENGINEERING AND METALLURGY, 5—AGRICULTURE, 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, \$12 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are various and expensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13-61y16p

Adams' Improved Railway Snow-Plow.

The object of this invention is to provide an improved engine or device for removing the snow from railroads. The peculiarity of the improvement consists in the fact that it is so constructed and attached to the locomotive that light snow can be caused to shoot up the inclined face of the plow, and be there held, if necessary, while the plow is backed out of a tunnel, or cut, and emptied at any convenient point; or it may be so operated as to throw the snow to the right or left of the road, or to throw it all upon one side or

hard or crusted over, the mouth of the machine should be made to cut the snow, before it raises it on the incline, thereby avoiding friction and saving power,—on the same principle that a man saves strength by cutting the snow on the sides with his shovel before lifting it. This is accomplished by giving cutting edges to the front of the sides D, D, as well as the front of the incline C.

The sides B, B, B, can be adjusted at pleasure, so as to hold more or less snow, as may be desired. To accomplish this the lower B,—which should have been lettered B', and which will be so considered in the balance of this description,—is intended

THE NEW UNIVERSITY REGENTS.—Gov. Haight has appointed the following gentlemen as Regents of the new University: S. B. McKee, Judge of the Third District; Lawrence Arthur, Judge of Santa Clara County; Rev. Horatio Stebbins, John T. Doyle, John W. Dwinelle, and Richard P. Hammond, of San Francisco; Dr. Samuel Merritt of Oakland; William Watt of Grass Valley.

The *ex-officio* Regents are as follows: H. H. Haight, Governor; William Holden, Lieutenant Governor; C. T. Ryland, Speaker; O. P. Fitzgerald, Superintendent of Public Instruction; A. S. Hallidie, President of the Mechanics' Institute in San Francisco; Charles F. Reed, President of the State Agricultural Society.

These Regents, numbering fourteen in all, are to elect eight others, so that the whole board will consist of twenty-two members, seven of whom constitute a working quorum. The organization will probably be completed in season for a transfer of the College of California at the next Commencement, which occurs in the first week of June. Hence there will be no necessary interruption of classes, and the work of education will go on with such modifications thereafter as may be required to conform to the University plan.

FROM LONDON TO CHINA AND JAPAN.—The distance from London to Shanghai, China, *via* the Isthmus of Suez, is 10,499 miles; from London *via* San Francisco, 8,355 miles;—making a difference in favor of the route through San Francisco of 2,144 miles. The distance from London to Yokohama, Japan, *via* the Isthmus of Suez, is 11,509 miles; while that *via* San Francisco it is but 7,520;—showing a difference in favor of San Francisco of 3,989 miles. The difference in point of time, when the Pacific Railroad is completed, will be *one month*. Nobody, who reflects upon these facts, can doubt for a moment that the great and growing tide of travel between Europe and the East Indies must eventually pass through San Francisco. A large amount of trade must also follow the same route; especially in the lighter and expensive articles of tea and silks. The value of this trade to London, alone, is now over \$50,000,000 annually, and is rapidly increasing. The chief port of the English tea trade is Liverpool, and not reckoned in the above. The trade of China and Japan will soon be ours, and cannot fail to do for us even more than it has done for England. It is impossible to over-estimate the value of this trade to this city and to the United States at large.

PROGRESS OF THE HOOSAC TUNNEL.—It appears from a Legislative report for 1867, that the progress for that year upon the Hoosac Tunnel, was more than double that of 1866; and the average monthly progress on the east heading, during the last half of the year, was 118 feet. The total number of men employed on the work is about 500. The cost up to January last was \$2,086,640.

ADAMS' IMPROVED RAILWAY SNOW-PLOW.

Cronise's New Work on California.

THE NATURAL WEALTH OF CALIFORNIA—Comprising its early history; geography, topography and scenery; climate; agricultural and commercial products; geology, zoology and botany; mineralogy; mines and mining processes; manufactures; steamship lines, railroads and commerce; immigration, population and society; educational institutions and literature; together with a detailed description of each county, its topography, scenery, cities and towns, agricultural advantages, mineral resources and varied productions. By Titus F. Cronise. San Francisco: H. H. Bancroft & Co., 1868. Imperial 8vo.—pp. 700.

The above title will give the reader a very correct idea of the plan and scope of this new work, which forms a most valuable and important contribution to the literature of California. Its appearance is most opportune, as it furnishes just the information sought by the great multitudes from all parts of the world, whose attention is now so much absorbed in the thought of making California their future home. The work furnishes a full and complete treatise on the present industrial condition, the future prospects and the permanent resources of the State—subjects which are now exciting more interest, both at home and abroad, than ever before since the admission of California into the Union. To the newly arrived emigrant, to one casting longing glances at this coast from whatever part of the world, and to all inquiring minds everywhere, this book will prove a magazine replete with reliable information, collected at the expense of much time and most laborious research. It undoubtedly will, as it should, receive a wide circulation, both at home and abroad. The plan of the work is comprehensive, its style clear, and the facts upon which it treats are brought down to the latest dates. Of the 700 pages which it contains, 43 are devoted to agriculture, 68 to mining, 47 to manufactures, 260 to descriptions and statistics of counties, and 282 to miscellaneous matters relating to the State. The book has been brought out as a large royal octavo, beautifully printed and bound. The printing was done from stereotype plates made in this city from California type. Its editor is Mr. T. F. Cronise, one of the ablest commercial writers in this State. He has been assisted in its preparation by as able a corps of assistants as could be found on the coast. It is published by H. H. Bancroft, and is sold for \$6.50. We have already given some extended extracts from the proof sheets, which were kindly furnished us in advance of publication, and shall further draw from it, from time to time, as we may find space in our columns.

the other, as is often found necessary in passing along hillsides with the slope sometimes upon one side and sometimes upon the other. Of course these operations require either different plows, or one so constructed that it can be rapidly changed and modified to meet the constantly changing nature of the road to be cleared of the snow.

In order to accomplish this object, the inventor of the machine herewith illustrated constructs a frame of wood, and mounts it upon low wheels, so that the forward part of the machine will skim along just over the rails, while the rear portion can be made to stand at an angle which can be readily varied from forty to sixty degrees. The front of the machine is constructed with a flaring mouth, with upright side pieces, D, D, and provided with a honnet, or gate, E, which, when the machine has taken a load which it is necessary to "hack out" with,—as from a deep cut to a convenient place of deposit,—can be let down, so as to prevent the load from slipping back again upon the road. This honnet is readily raised or lowered by devices shown in the illustration at P, O.

In order to make a plow work successfully in deep snow, especially when it is

to show the side when drawn back, and thereby brought below the face of the floor of the incline C. The portion of the figure in light, shown at B, is intended to represent what should have been marked B'. By moving it still further forward, the sides may be made still higher.

G is a share or dash-board, placed upon a slide F, which may be shoved down over C to near the mouth of the plow, when the sides are thrown back to B'. Its point may be placed, as here shown upon the left hand side of the plow, when all the snow may be thrown to the right, or it may be placed *vice versa*; again it may be placed in the center and made to throw the snow both ways. When used for such purpose it is slid down to the front of the machine. It is also used to unload the plow in clearing out deep cuts by being forced down to crowd the snow off from either side of the frame. All this is accomplished by simple and readily manipulated devices, not fully shown in the illustration, but operated from the points P, O.

SEMI-CIVILIZED!—Among the five millions of people by whom Jeddo in Japan is inhabited, there is not a beggar in the streets, not a man unable to read, not a hoer, not a drunkard, not a ruffian.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

Amalgamation by the Admixture of Metals.

BY DR. L. LANSZWEERT.

ZINC PROCESS.

EDITORS MINING AND SCIENTIFIC PRESS:

In the series of my articles on the problem of gold and silver extraction, published in your valuable paper in 1865, remarks were made on the advantages derivable, in the process of amalgamation, from the admixture with the mercury, of various metals—such as copper, tin, zinc and lead; and a full description of the use of copper amalgam was published in the MINING AND SCIENTIFIC PRESS of Nov. 4, 1865.

Mr. d'Heureuse, in a note on the use of zinc with mercury, published in your paper, May 16, 1868, says that the action of zinc in increasing "the retentive efficiency of the mercury for gold and silver, may be attributed to the rough and barbed edges peculiar to the fracture of cast or semi-fluid zinc; similar to the state in which it appears in the amalgam." This explanation is somewhat incomprehensible, and lacks that clearness which should be expected from the patentee of a "zinc process" for extracting gold from its ores, to whom zinc reactions ought to be familiar. It is a peculiar and noted fact, that the amalgamation of zinc comprises two distinct phenomena;—the liquefaction of that metal by or mercury, and the formation of an alloy or amalgam—that is to say, of a well, chemically defined compound. The term alloy, in its most general acceptance, means the mutual combination of one of two or more metals. When one of the metals, however, entering into combination is mercury, the result is not usually termed an alloy; but an amalgam. All ores are practically interesting to the metallurgist in two ways,—either the metals to which a metallurgical process of extraction is applied are found in the condition of native alloy—i. e. one naturally existing; or an alloy results as the consequence of an intermediate metallurgical process. In putting in contact mercury with a solution of chloride of zinc, by electrolysis, an amalgam is obtained which, submitted to pressure, gives a combination, crystalline in form, of one equivalent of mercury to three of zinc.

How to obtain this crystalline form with the homoeopathic dose of Mr. d'Heureuse's formula, one ounce or less of zinc, for ten pounds of quicksilver, is a mystery to me. I doubt very much the beneficial effect of zinc amalgam in the reduction of gold ores. The results obtained from my experiments in that direction, have uniformly corroborated my statement that, for the reduction of gold ores, mercury cannot be too pure. The presence of foreign metals alloyed with the gold in a large percentage, as is the case in quartz from most of the lodes, will occasion loss, and much embarrassment in amalgamating; but zinc will only improve the action of quicksilver in the reduction of silver ores; and that of a certain class, especially chloride and bromide,—copper having a greater affinity for sulphur, than zinc, lead or tin, should, for this reason, be substituted whenever the ores to be reduced are mostly sulphides. Zinc is used in Mexico for the reduction of silver ores, only—not for gold. The addition of copper, lead, tin or zinc, to the quicksilver, is to obtain a more electro-chemical action on the reductive salts or magistral, used for the precipitation of silver, and reduce the loss of quicksilver. The proportion of these metals to be so used, is that necessary to effect the reductions—that is to say, a little more of one equivalent of these metals for each equivalent of silver to be precipitated. In the experiments made at the Guadalupe y Calvo Mine (Mexico), 33

to 35 parts of copper were used for 100 of silver precipitated. If, in place of copper, lead, tin or zinc is to be used, about the same amount as above will be found necessary; besides, the metal which is to replace the quicksilver, as reducing agent, must be in a very finely divided or minute state; without that, its action would be very tedious or incomplete. The simplest process to obtain these metals, thus divided, is to combine them with mercury, and thus make a liquid amalgam, easily disseminated through the mass. Hence I can hardly admit that zinc increases the retentive efficiency of the quicksilver, "by its rough and barbed edges."

If millmen, with a dollar's worth of zinc, will save pounds of gold and silver by this free process, what will they save by passing gold-bearing substances, reduced to a fine powder, without previous alloy, through melted zinc, by introducing said substances below the surface of the melted zinc, as per d'Heureuse's patent claim? The melting point of zinc being 707° Fah., and that of gold 2,015°, what effect can be produced or obtained by passing gold ores through melted zinc at 707°, which temperature cannot be increased, as the zinc would in such case pass off into vapor? Sometimes in the manufacture of brass, when the zinc is first melted and copper plunged into it, the formation of an alloy will immediately commence, without the fusion of the copper. Copper plates and rods are sometimes partially converted into brass, by exposing them, at a high temperature, to the vapor of volatilized zinc.

THE CALORIC WATER-ELEVATOR.—An interesting exhibition was recently given near the Old Colony Railroad station of a new invention called the "Caloric Water Elevator." It consists of two cylinders of about one thousand gallons, the upper one being filled as an air-chamber, the lower one for water. A locomotive was placed on the track near the machine, and steam let on from it into the air-tank. The pressure of the air upon the water, caused by the introduction of the steam, immediately forced the water out through an eight-inch pipe. Eight hundred gallons was discharged in a half minute. For raising water when steam is convenient, this apparatus can hardly have a competitor. As a safeguard against fire it is invaluable. It is a simple machine, attended with no expense after its first introduction, and takes the place upon railroads of all pumps, tank-houses, etc.—*Boston Evening Transcript*.

We presume the water elevator above referred to is the "Wilcox Water Lifter," which was illustrated in our issue of Dec. 21, 1867, and which attracted much attention at the late State Fair at Sacramento. These water-lifters are now being introduced on the line of the Central Pacific Railroad, in this State.

THE INVENTION OF VULCANIZED RUBBER. After long years of effort and disappointment, Charles Goodyear stood apparently as far as ever from the attainment of his object; until one day, while in earnest conversation regarding his proposed invention, he emphasized an assertion by flinging away at random a piece of rubber combined with sulphur that he held in his hand. The fragment falling upon the stove, was subjected to a higher heat than that to which he had ever ventured designedly to subject the material; and when it was recovered it was found to possess the qualities for which he had sought so long; cold did not harden and heat did not soften the water-proof and elastic mass. And thus sprang forth the germ of an invention that has built up a new branch of manufacturing industry, given employment to thousands of operatives, and added in myriad forms to the conveniences of life.—*American Artisan*.

MARINE PAINT.—The *Scientific American* notices a recently patented paint for ships' bottoms, which is thus described: "This paint is produced by the combination of a pasty mixture of white lead and hoiled linseed oil with about an equal portion of a pasty solution of caoutchouc, or gutta percha, and a sufficient quantity of hoiled linseed oil to reduce the paint to the desired working condition. The caoutchouc, or gutta percha, may be reduced to a pasty condition by the use of naphtha oil."

NEW FACT IN MAGNETISM.—M. Gerard has found that if a ring made of wire, the diameter of which varies regularly,—so that one side is very thin, and the other much thicker,—he suspended over an electro-magnet, it will revolve.

The Birmingham Lock Trade.

The following, from the *Engineer*, will be read with interest by the American artisan. He will instinctively contrast the picture here given of the English workman's condition, with a picture of his own drawing. We should add, however, that the remainder of the article, which we have not space for, speaks of the recent introduction of very complete machinery for lockmaking in Birmingham:

"As is well known, the lock trade is one of the most extensive in the neighborhood of Birmingham, or rather we should say of Wolverhampton, for the principal part of the production of these articles in the district gravitates towards the latter town; but the miserable condition of this trade, which is both a mechanical and social disgrace to the country, is not so generally understood. Common lockmaking in England is, perhaps, the only trade of which it can be said that no mechanical improvement has been introduced since its commencement; that the quality of the article produced has steadily deteriorated, and that although from the natural increase of consumption a proportionate increase in production has taken place, yet the wages of the work-people have continued miserably low, and fall during depressions in trade to a pittance which barely affords existence. The chief cause of this state of things is to be found in the system on which the trade is carried on. It has been the custom from time immemorial for the lockmaker to work at home, buying weekly by retail the small quantity of iron required for his week's work, and selling the finished article, if finished it can ever be called, on Saturday, to some one of a clique of factors who practically can dictate their own terms, and often give a price scarcely more than covering the value of the iron in the few dozen locks brought in by the workman. To those who know little of this trade a word or two of explanation will be necessary in order to show how completely this dictation of price is in the hands of a kind of middlemen, who are neither manufacturers nor merchants in the true sense of the term. It might be supposed that, from the very fact of each man's house being his factory, and of his being able to dispose of, or to hold over the fruit of his labor at the end of each week, he would occupy a more independent position than that of most other artisans; but in fact the very reverse is the case, for in order to live he must not only realize something, however small, for his labor, but is bound above all things to recoup his capital every Saturday in order that he may have wherewithal to begin work on Monday. In fact he labors under all the disadvantages of the most embarrassing form in which labor and capital can be combined, if the latter term be not, indeed, out of place in this instance.

The lock factor thoroughly appreciates this condition of affairs. Whilst the maker has perhaps forty or fifty factors to whom he may take his wares, the factor knows that there are many thousands of workmen, a regular proportion of whom must come to his particular net every Saturday with locks that must be exchanged for coin from dire necessity. The result of this state of things is that not only have wages sunk to something like the miserable price paid for shirt making before the introduction of the sewing machine, but the quality of the locks has of course deteriorated, till they are now about the greatest rubbish that it is possible to conceive. Some classes of padlocks are sold as low as 6½d. a dozen. It is needless to say that they are utterly worthless, except perhaps for the purpose for which some African chiefs employ them, viz., the ornamentation of their noses. Any old nail or scrap of wire will open them, but of all other instruments the key which is sold with them is usually found to be the most inappropriate for that purpose. In one or two instances something like lock factories have been established, in which the owner employs a number of workmen by the piece, and finds the material himself. This is a step in the right direction, but one which has been so triflingly followed as scarcely at all to affect the present pernicious mode of working the trade. Whilst matters are in this state in Staffordshire, the Americans have shot ahead of us considerably, both in the quality of their locks and in the comparative cheapness of those which are really good articles. The partial introduction of machinery and the consequent accuracy and interchangeability of parts have placed American lockmakers on a much higher footing than our own, and although they labor under the disadvantage of being obliged to employ handwork in many of the details, they have made considerable

strides in advance of the English lock-maker. The introduction of machinery for the formation of every individual part is all but essential, if machinery be adopted for the formation of any of the parts; for machine accuracy in one set of the pieces composing a lock, demands equal accuracy in all the other portions, which it is impossible to attain cheaply by hand finishing."

The First Locomotives.

The rail was invented more than a century before the steam carriage, yet, singularly enough, the contrivers of the first locomotive did not think of using it on a railway. James Watt has recorded that, in 1759, his friend, Dr. Robinson, who was then a student at Glasgow College, suggested that the steam carriage might be employed in moving wheeled carriages on the highways. Watt does not seem to have acted on the hint until the year 1784, when he took out a patent for an adaptation of the steam engine to the propulsion of land carriages. He apparently had not much hope that anything could be achieved by such a contrivance, for he stated that "a carriage for two persons might be moved with a cylinder of seven inches in diameter when the piston had a stroke of one foot, and made sixty strokes in a minute." So little did he regard his invention, and so averse was he to the use of high pressure steam, that he never built a steam carriage; but his friend and assistant, Mr. William Murdoch, constructed, in 1784, a working model of a machine, which, though only fifteen inches in length, attained a speed of six or eight miles an hour. This was the first locomotive in Britain, and it is preserved in the Patent Museum. In 1802, Messrs. Trevithick and Vivian, of Camborne, in Cornwall, patented a steam carriage for common roads, and two years afterwards they constructed a locomotive for the Merthyr Tydvil railway. This was the first steam engine applied to locomotive purposes in Britain, and the leading features of it were essentially the same as those of the railway engines of the present time. For twenty years after, however, little progress was made in working out or extending the use of steam engines on the railways. A number of machines had been devised; but one after the other they were set aside. In 1814, George Stephenson made a locomotive for the Killingworth Colliery railway. It could draw thirty tons at the rate of four miles an hour, and was regarded as a great step in advance. An engine of the same kind was used on the Stockton and Darlington railway, opened in 1825, and of which Stephenson was engineer. This engine may be seen at Darlington Station, where it has been set upon a pedestal. The number of rods and cranks about the machine give it a complicated appearance, and it looks odd in contrast with the engines that have superseded it. When the Manchester and Liverpool railway was being constructed, in the years 1826-9, so little was known either as to the capabilities of railways or the most advantageous mode of working them, that the directors and engineers had some difficulty in deciding whether the line should be wrought by fixed engines or by locomotives. It was ultimately decided to use locomotives, and the directors offered a premium of £500 for the best locomotive that could be produced in accordance with the following conditions: "That the chimney should emit no smoke; that the engine should be on springs; that it should not weigh more than six tons, or four tons and a half if it had only four wheels; that it should be able to draw three times its own weight, and not cost more than £500." Four engines were entered to compete for the prize, and the trial of these, on the 15th of September, 1830, was one of the most interesting incidents in the history of railways. George Stephenson's "Rocket" won the day. It drew three times its own weight, or twelve tons fifteen cwt., at an average speed of fourteen miles an hour, and obtained a maximum velocity of twenty-nine miles an hour.—*Scotsman*.

THE WORK GOES ON.—There is a force of 450 men on the western end of the Western Pacific Railroad. About fifty of these men are engaged in cutting the tunnel in the Livermore Mountain, which, when completed, will be some 1,400 feet in length. The number of hands will soon be increased to 600.—*Sacramento Bee*, May 13th.

"CHARITY begins at home." If you would save money, buy your shirts at the working "Women's Coöperative Union," and thus gladden other hearts and homes. The store is at No. 39 Second street.

Mechanical.

Puddling.

An article in the *Scotsman*, in description of the iron works of Messrs. Colville & Gray, Coatbridge, gives so graphic a picture of the "puddling" operation that we copy a portion of it. Most of the severe labor here spoken of, is now done by recently introduced machinery.

In about a quarter of an hour after the furnace has been sealed, the iron shows signs of melting, and an aperture in the hearth door, about six inches square, is opened. The puddler, whose eyes seem to be proof against a light as dazzling as the sun at noon, looks in at the opening, and determines whether it is time to disturb the iron. So soon as he sees the finer angles of the iron begin to melt, he thrusts in a stout rod of malleable iron, and moves the lumps of metal about, so that the entire mass may be equally heated. If this were not done, the parts which melted first would be burned up and lost, and the quality of what remained deteriorated. The puddler's assistant takes a turn at this part of the work; and during its progress the heat is occasionally moderated by means of the damper, or by dashing small quantities of water upon the iron. At frequent intervals the puddling bar is withdrawn and cooled by being dipped into water. The iron dissolves gradually on the hearth, and after a time begins to heave and bubble, innumerable jets of flame hursting forth all over its surface. The desired chemical change is now going on. The hot air from the furnace sweeps over the iron and carries off a great part of the carbon, sulphur, phosphorus, and silicon contained in the pig iron. Care must be taken to prevent the metal from becoming too fluid; and as soon as it attains a pasty consistency, the heat is moderated. Meantime, the puddler uses his rod vigorously; and as the metal now begins to "dry," the labor of moving it about is increased. The metal at length seems to curdle and become granular. As it then ceases to give off carbonic oxide, the heat of the furnace is again raised, and the particles of metal begin to adhere together. From this point the chief puddler undertakes and completes the operation. As the metal agglutinates, it becomes very difficult to move. The puddler has to exert himself to the utmost; and he dare not relax his efforts for a single minute, else all the previous labor would be worse than lost. Though the perspiration trickles from his face and arms, and oozes through his scanty clothing, he must toil on. His eye is never removed from watching the contents of the furnace; and the expression of anxiety on his face indicates that the operation has reached a critical point. When the metal has attained a certain degree of consistency, the puddler divides it into five or six heaps. He then works each heap into a "ball" or "bloom." The door of the hearth is opened, and one after the other the balls are drawn with a large pair of tongs and dragged over the iron floor to the "shingling" hammer. As the balls are drawn from the furnace they have a spongy appearance, and slag and other impurities trickle from them. The operation we have described occupies, on the average, about two hours, and the quantity of unrefined pig iron required to make a ton of puddled iron may be stated at from 22 to 23 cwt.

SHAFTING.—The first thing examined by a thorough mechanic when he comes into a manufactory, is the shafting. A due regard to the proper hanging and proper care of the shafting, will save many dollars in the course of a year. The line must run true, the boxes must not wobble, there must be no rattling or grinding, the boxes must not exude oil at their ends. The building must be firm. In a rattle-trap with shrinking and springing walls and imperfect foundations, a line of shafting will not keep its place twenty-four hours; power is lost in consuming friction, and the machinery rapidly deteriorates. When the shafting is supported by brackets, these should be placed by a straight-edge and level; when by hangers, a chalk line should mark the center of each hanger or a line directly over the center of the shaft. The hangers or brackets should not be so far apart as to allow of sagging in the slightest degree; and should also be proportioned to the weight of the shaft. The above is condensed from the *Scientific American*.

CASTING STEEL UNDER PRESSURE.—Jas. Henderson sends the *Scientific American* the following extract from Antoine Galy-Cayal's U. S. patent, Feb. 19, 1867:

"It is well known that cast steel run into molds is subject to blister, and is otherwise porous, which defect reduces considerably its toughness. In order to give this metal its requisite tenacity, it is subsequently reheated and then rolled and hammered. As many articles, such as cannon, cannot be treated in this manner, I have devised to submit them to a high pressure while in a liquid state inclosed in their sand molds maintained in iron flasks. For this purpose, immediately after running a cannon, I cover hermetically the head by a metallic cap, by means of bolts or other devices attached to the flask. This cap is fitted in its center with a vertical pipe, and provided with a cock at its lower extremity, while its upper extremity is closed by a washer pressed with a bolt in such a manner as to act as a safety valve. Before attaching the cap at, supposing an inch from the surface of the liquid metal, I introduce in the vertical pipe, and between the cock and the washer a charge of about one-quarter of an ounce of gunpowder, in the proportion of eighty parts of saltpetre and twenty of charcoal, with no sulphur. On opening the cock this powder falls on the metal, ignites, and engenders about one-third of a cubic foot of gas at 1,400° Cent. These gases exert on the liquid metal a pressure which is transmitted through the entire mass, thereby condensing the same and expelling the blisters. The effect thus produced is equivalent to the pressure of a head of liquid metal ninety feet high, admitting that the capacity between the cap and the surface of the metal contains thirty cubic inches. By making the flasks sufficiently strong the charges of powder may be varied, so as to produce by its ignition a uniform and general pressure, which is preferable to the partial, irregular and momentary action of a hammer."

A UNIFORM SYSTEM OF SCREW THREADS. Theodore Zeller, Chief Engineer U. S. N., is the President of a Board of Engineers, appointed by the Secretary of the Navy to examine and report upon the various systems of screw threads in use by the principal manufacturing establishments in the United States, with the view of recommending a uniform system for general adoption. Chief Engineer Zeller has therefore issued circulars containing blank forms, to be filled out and returned to him at the Philadelphia Navy-yard, where the Board will meet. Particulars are requested in regard to the best form and angle of thread, in the opinion of each party, and also in reference to other points.

CONSUMPTION OF SMOKE.—A writer in the *London Mining Journal* for April 4th, after reviewing some of the various plans which have been devised for the prevention of the smoke nuisance, describes the plan upon which the new furnace of Mr. Allan, of Newcastle, is constructed. This furnace has a series of tortuous air passages above the furnace door, the external ends of which are fitted with an adjustable cover, to regulate the quantity of air required for different qualities of coal. The air in traversing these passages is heated to a temperature of about 50° or 60°. The result is the instantaneous conversion of the coal gas into flame. This is accompanied by a saving, in the quantity of coal consumed, and there being no movable mechanism, they are not in the least liable to derangement.

THE SIEMENS' FURNACE.—Mr. C. W. Siemens' regenerative furnaces, and also his more recently invented process for producing steel direct from the pig-metal, are now being applied in France on a most extensive scale, at the works of Messrs. De Wendel & Co., in the department of the Moselle. There will be, in all, 248 producers. Each producer converts into gas two tons of fuel every twenty-four hours, so that the total consumption will be nearly 600 tons per day. The work would require 1,000 tons per day under the present system, so that there will be a saving of 400 tons per day by the gas furnaces, besides an even more important saving in the iron itself. Careful experiments have proved, that where the Siemens' furnace is used, the wasting of the iron is reduced three per cent.; and in the case of which we are speaking, the saving thus effected will amount to about 70 tons of iron per day. — *Engineering*.

Scientific Miscellany.

CARBOLIC ACID IN TANNING.—Prof. H. Dussance, who has been experimenting upon the use of carbohc acid in the tanning of leather, communicates the conclusions arrived at to the *American Artisan*, as follows:

1. Tanning rats, with the addition of carbohc acid, can be left any length of time to the air without destruction of the tanning properties of their contents.
2. The tannin being present all the time in its pure state, less bark is required.
3. Vats prepared with bark moistened with water and carbohc acid keep their strength until all the tannin is combined.
4. Extracts prepared with it will keep without destruction of the tannin.
5. Leather tanned in such baths acquires imputrescible properties, and can be kept in damp places without alteration.
6. The bad smell generally emitted in tanning, currying, gut-dressing, etc., shops, is avoided, and the use of this acid is preferable to chloride of lime, this latter emitting a strong odor generally very disagreeable.
7. Leather made by this process takes some of the properties of Russia leather.
8. The work can be pursued at any time of the year; putrefaction being avoided.
8. One-eighth of the quantity of bark can be saved, and the time of tanning can be reduced at least to one-sixth.

Prof. D. prepares pure carbohc acid from the heavy oil resulting from the distillation of coal-tar, that is, the oil boiling between 302° and 304°. This is treated with an excess of caustic soda, heated and left to settle. The clear liquid is a concentrated carbolate of soda. It is decanted, dissolved in five or six times its volume of hot water, well stirred, and left to cool. The clear part is drawn off, and a little excess of hydrochloric or sulphuric acid added to it. The carbohc acid separates, and swims on the surface of the liquor. It is decanted and washed with cold water; and is then ready for use. A simple method of preparing it for tanners' use is to put a barrel of coal-tar from gas-works into a large hog-head, and fill it with lime water. Stir it well, and let it settle. Decant the clear liquid,—which may be used at once.

"UNIVERSOLOGY."—Mr. Stephen P. Andrews delivered a lecture at a recent meeting of the Polytechnic Association of the American Institute, upon the "Unity of the Sciences," or, as he called it, "Universology." As reported for the *American Artisan*, Mr. Andrews said that he here made the first formal announcement of the discovery of this new science, and he read from the introduction of a forthcoming work an elaborate statement of its domain and nature, and claimed that it held the same relation to the universe, as a whole, as that which any special science has held, in its own special domain. He said that from time to time during the past five years the public have been made aware, through partial announcements or intimations, that he was devoting himself to an unusual series of scientific and philosophic investigations which looked to the recouidite ground of unity between all the sciences. One of the branches of the discovery is said to be the basis of a new scientific universal language, which it is supposed by some persons will be ultimately the vernacular of the world. The introduction of the new work, which was read by Mr. Andrews, was made up of a series of papers written by several students of the new science, who had more or less mastered it, and now belong to an incipient university which the discovery has already been the means of organizing.

Some discussion followed the delivery of the lecture, and the curiosity of the audience seemed awakened, and exhibited a manifest desire to learn more of this new science.

NEW GALVANIC PILE.—Messieurs W. de la Rue and Hugo Muller have constructed a pile, which, although less than three inches high, is said to be extraordinarily powerful. The positive element is a zinc rod; the negative, a silver wire coated with chlorido of silver. A saturated solution of common salt is used for the exciting liquid.

THE "SUN-DEW."—L. A. Millington in the *American Naturalist* for April, calls the attention of botanists to a little plant, the *Drosera rotundifolia*, or sun-dew, which not only catches flies, but eats them. Its tiny leaves have red glandular hairs, each tipped with a drop of glutinous liquid. Any small insect which touches this is lost. Its struggles only farther entangle it. All the hairs then begin to move slowly towards it; and in a few hours touch and cover it with their glue. Mr. Millington experimented with some specimens by laying the bit of moss on which they grew, upon a plate of water. He fed them with insects and with beef-steak. He placed a piece of the last named on the center of a leaf. "In twelve hours," he says, "nearly every hair touched it. They gathered over it in knots and remained so for a day and a half, when they slowly returned to their natural position, leaving the beef a white sodden atom resting on the points of the hairs. I tried it with a bit of paper, but it refused to move for that; then a tiny fly was touched to one of the treacherous dew-drops, smothered, and in a few hours all the ferocious little scarlet hairs had their beaded points upon his body. When the blossom bud appeared, the glands no longer secreted the dew, and the leaves lost their brilliant color."

THE SECRET NOT YET DISCOVERED.—Prof. A. de la Rive, in a memoir of Faraday, translated from the *Bibliothèque Universelle*, for the *Philosophical Magazine* for December, makes the following remarks:

Since the discovery of the mechanical equivalent of heat, it seems as if everything had been said and everything were easily explained by means simply of a ponderable matter, an imponderable æther, and a mechanical impulse. Vulgarizers of science, more anxious to produce an effect than to remain faithful to scientific truth, proclaim a molecular system of the world destined to form a pendant to the *Mécanique Céleste* of Laplace. According to them, nothing is more simple, nothing clearer; attraction itself, which has been the object of the study of so many superior minds, is merely the effect of an impulse easy to understand. A dangerous illusion! No doubt science has entered upon a fertile course, but only on condition of advancing with sure and consequently with slow steps. We speak of the unity of force, and of the transformation of forces one into the other; but do we know what are forces? do we know their nature? We have certainly proved transformations of movement, and shown that one work may change into another work, mechanical motion into heat, and heat into mechanical motion; these are, without doubt, the most important points gained by science, and enable us to get a glimpse of the existence of a single cause manifesting itself in various forms. But it is a long way from this to the discovery of this cause, this single force. Shall we some day arrive at it?

PYROGALLIC ACID.—The old process for making this compound usually gives only 25 per cent. of the weight of gallic acid employed. Messrs. de Luynes and Esperandien, by the action of heated water, transform gallic into pyrogallie and carbon acid. Into a brass cauldron having a tightly-fitting cover they introduce gallic acid with two or three times its weight of water. The cauldron is then heated to 200° or 210° C., and that temperature is maintained for nearly two hours, when the solution of pyrogallie acid will be found slightly colored. The color is removed by bone-black and the water by distillation. A clear white product may be obtained at once by distilling the gallic solution *in vacuo*.

REDUCTION OF CARBONIC ACID TO OXALIC ACID.—Dr. E. Drechsel has achieved a triumph in synthetical chemistry by producing the oxalate of soda by means of carbonic acid. A mixture of pure sodium and dry sand is heated in a flask to about 350° C., over which a stream of dry carbonic acid is rapidly passed. After a few hours the metal becomes red and ultimately black. To avoid the reduction of the carbon, the heat should be moderated in the latter part of the operation, and the whole slowly cooled. Left in the air to oxidize, and then exhausted with water, about one-tenth of the mass is found to be oxalate of soda. In the same way oxalate of potassa may be obtained from an amalgam containing two per cent. of potassium.

California Academy of Sciences.

REGULAR MEETING.

MONDAY EVENING, May 18, 1868.

Vice President Dr. James Blake in the Chair.

The Secretary being absent, Dr. Henry Gibbons, Jr., acted as such. Five propositions for membership were read. The attendance was somewhat smaller than usual. Dr. J. G. Cooper was elected Vice President, in place of Dr. Blake, who was chosen President at the previous meeting. Mr. Bloomer was proposed to fill the office of Director of the Museum, made vacant by the resignation of Mr. Stearns, who has gone East.

The Librarian laid before the Academy a large number of foreign scientific exchanges, embracing the proceedings of some of the leading scientific bodies of Europe, all of which will be added to the library.

Dr. Kellogg read a communication from E. W. Burr, accompanying a curious specimen of insect life, found only and recently on a single pine in Monterey, with a request that the Academy would examine and report upon the same. The insect appears to be increasing rapidly. The subject was referred to Dr. Behr for examination and report. Some discussion was also indulged in concerning the periodic development and disappearance of insects, and the transmission of predacious insects from one country to another. With reference to latter fact, the President mentioned an insect which was imported to England from America, against which nothing of great injury was known in this country, but which spread with wonderful rapidity all over England, and destroyed very many apple trees. It was known as the "American Blight."

Dr. Behr stated that the weevil was imported to this country in a cargo of grain from New Zealand. Until then, nothing was known of it.

Dr. Kellogg said that the Hessian fly was supposed to have been imported during the Hessian war.

Dr. Kellogg presented specimens of the Holly-leaved Cherry (indigenous) found in the neighborhood of San Francisco, and supposed till now to have become extinct; and a specimen of real *Prunus Virginiana* found on the Potrero, and commonly known as the Choke Cherry. The Dr. remarked that the Indian name of this tree is *Isleis*; and that the creek of that name, flowing through the southern portion of the city derived its name (given by the Indians) from the great numbers of this tree which formerly grew upon its banks and about its source.

Dr. Gibbons stated that the taste of both these cherry species cannot be distinguished from that of the Eastern wild cherry, the hydrocyanic odor being distinguishable in the blossom. Some discussion followed upon the question whether hydrocyanic (Prussic) acid exists in the cherry, peach and almond species, naturally, or whether it is a product of certain chemical changes; the latter is the opinion generally entertained by chemists. These changes take place after the plant or fruit has been macerated; a period of some twenty-four hours usually allowed for the fullest development of this acid. This accounts for the fact noticed that while cattle may eat freely and with impunity of the branches of the wild cherry, immediately after they have been removed; death or dangerous illness often follows when such branches are eaten after they have been lying for some time upon the ground in a mutilated condition.

Mr. Bloomer propounded the query whether a poison introduced into the cells of a plant would communicate itself from cell to cell, and permeate the whole plant. He instanced the case of an experiment by introducing strychnia into the cells of a cabbage leaf.

A member stated that there were but one or two substances which were capable of poisoning plants. There were several instances, however, of coloring matter permeating plants.

Dr. Gibbons claimed that there was a power of taste which enabled plants to select and avoid according to their necessity.

The President thought the spongy roots of the plant alone could exercise such discriminating power; that when these were severed, it became nothing more than a lifeless mass of capillary vessels, through which poison could have willing access. Dr. Behr stated that in the middle ages, persons were killed by eating plants watered with poisonous solutions with murderous purpose.

The Committee appointed to make arrangements for a course of public lectures was granted further time.

A proposition for a field meeting was left to the Council, who will announce the time for an excursion in the papers. The Academy then adjourned.

New Patents and Inventions.

Under this heading we shall mention, from week to week as occasion may demand, New and Important Inventions; also, the last of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

List of patents issued from the United States Patent Office for the Pacific Coast and Territories for the week ending April 28th, 1868:

77,157.—IMPROVED ANIMAL TRAP.—A. J. Adams, Portland, Oregon, assignor to self and Boyd P. Quincy, of same place.

77,163.—IMPROVEMENT IN THE MANUFACTURE OF BRICK.—Silas H. Bowman, Half Moon Bay, Cal.

77,183.—IMPROVED AMALGAMATOR.—Stephen Fountain, Silver City, Nev.

77,259.—IMPROVED APPARATUS FOR DISINTEGRATING ORES.—Jerome B. Cox, San Francisco, Cal.

77,273.—IMPROVED TRESTLE.—James E. Gedney, Petaluma, Cal.

77,297.—IMPROVED TIRE SHRINKER.—John Macy, of Pine Grove, Oregon.

77,343.—IMPROVED MEDICAL COMPOUND.—Robert Alexander, Eugene City, Oregon.

APPLICATION FOR REISSUE.

FRICION PAWL.—Joseph Moore, San Francisco, Cal. Patented May 7th, 1867. Application for reissue filed April 8th, 1868.

I claim the employment upon the main or counter-shaft of the windlass in hoisting apparatus of a pulley which shall be, on the one hand, under the control of a rake, and on the other hand be connected with the shaft by the pawl and ratchet device or its equivalent, substantially in the manner and for the purposes set forth.

PATENTS RECENTLY ISSUED.

71,707.—DENTAL SUBSTITUTE.—George W. Cool, Portland, Oregon:

I claim the mode of fastening the thin plate or lining to the vulcanite or other dental plate heretofore in use, in the manner above described.

The nature of this invention consists in lining the concave surface of a vulcanite plate with gold. The benefits accruing from such a metallic lining are enumerated by the inventor as follows: 1st, It makes a plate one-third thinner than the ordinary vulcanite plate twice as strong; 2d, It prevents the acid of the mouth from roughening the plate and turning it black, a common occurrence; most vulcanite plates turn black after being used a very short time, particularly in cases where tobacco is used for smoking; 3d, This style of plate admits of a finer finish than any other in use; 4th, The secretions of the mouth have not the same tendency to adhere to this plate that they have to the common vulcanite plate; 5th, Vulcanite being a non-conductor of heat, produces an unnatural warmth in the mouth, after inducing inflammation; while gold, being a good conductor of heat, when combined with vulcanite, has a tendency to keep the mouth cool, and prevents irritation.

We have carefully examined the above described invention, and have no hesitation in pronouncing it one of no ordinary merit; and one which we think must come into general use. We understand that quite a number of the leading dentists of this city have expressed themselves as much pleased with it. It has been introduced to some considerable extent in Oregon, where Mr. C. has heretofore resided. He has recently come to this city with the view of introducing it here; which being accomplished, he will go to New York for the same purpose. Dentists, and all others interested in any improvements in this direction, will do well to call upon Mr. Cool, at his rooms, 14 Third street, and examine specimens of this work.

76,587.—IMPROVEMENT IN GUN-LOCKS.—Salmon Belden and John Frankling Crabtree, Visalia, Cal.:

We claim 1. The lever F, having a short arm connected with the tumbler by a link and a long arm, to be held by the trigger, when at full cock, and released when the trigger is drawn for discharge, substantially as described.

2. The safety-catch, consisting of the lever n, spring p, and lever r, together with

the notch o, shoulder u, and the pin v, the whole combined and operating substantially as and for the purpose described.

The object of this invention is to provide an improved gun-lock, in which the following advantages are claimed over those hitherto constructed: First, greater simplicity of construction, with a very few parts, while the trigger, acting directly upon the hammer, will operate it quicker; second, an arrangement by which the lock may be used as an ordinary trigger, or may be converted into a hair-trigger for a rifle; and then, a safety-catch, of such a construction that it is impossible for the hammer to strike the cap on the nipple, without first fully cocking it, and then pulling the trigger. As the trigger acts directly upon the hammer, without the intervention of the sear and tumbler, its action is much quicker and more certain, while the whole lock has less friction of parts, and is much less liable to get out of order than any now in use.

76,778.—IMPROVED DRAIN AND WATER PIPES.—Wm. P. Kirkland, of San Francisco, Cal., assignor to himself, John L. Murphy and Edgar W. Murphy:

I claim, in the manufacture of drain and water pipes, the use of ropes, cords, or strands, dipped in a pitchy or tarry substance, and wound spirally or placed at right angles around a form, for the purpose of obtaining the desired shape and thickness of the pipe.

Also, the use of affiling of oakum or other fibrous material, placed under the strands or cords, substantially as described, for the purposes set forth.

The nature of this invention is to provide an improved drain and water pipe, combining strength with durability and cheapness. To accomplish this object, the inventor employs a series of strands or cords, loosely twisted, and places them in a tank or cauldron of boiling asphaltum or pitchy substance, and confines their ends to a cylinder or roller, suspended over the tank. These cords or strands are so attached to the cylinder or form, that in turning they will cross each other diagonally. Between each coil of rope he places a layer of oakum or hemp, and when a desired number of coils or layers has been wound upon the roller it is withdrawn, and the pipe is coated with the contents of the tank above described.

77,141.—IMPROVEMENT IN SEED SOWER AND HARROW ATTACHMENT TO GANG PLOWS. J. B. Webster, Stockton, Cal.:

I claim 1. The plow-frame a, a', b, provided with means for attaching a seeder to its front end, and provided also with the frame d, d', at its rear end, for the attachment of a seeder, substantially as described.

77,157.—IMPROVED ANIMAL TRAP.—A. J. Adams, Portland, Oregon, assignor to self and Boyd P. Quincy, of same place.

I claim the spring C, and claws K, in combination with the hinged treadles and the base A, E, all constructed, arranged, and operating substantially as described.

77,163.—IMPROVEMENT IN THE MANUFACTURE OF BRICK.—Silas H. Bowman, Half Moon Bay, Cal.:

I claim the use of petroleum and peat in the manufacture of bricks, by mixing both, or either one of them, with the clay of which bricks are to be made, substantially in the manner and for the purposes set forth.

The nature of this invention is the combination and mixing of combustible materials with the clay, employed in making bricks, so that the time ordinarily employed in burning, and the cost of fuel will be greatly reduced, while the substances incorporated will be consumed. Oil and peat or any similar substance may be used.

77,183.—IMPROVED AMALGAMATOR.—Stephen Fountain, Silver City, Nev.:

I claim casting the pan with a hub, having an opening through it for the shaft to pass through, and having a double wall around this opening, to form a steam-chamber for supplying heat to the machine, substantially as described.

The object of this invention is to provide an amalgamating pan with a steam chamber around its center, to be cast entire, and of one piece with the pan, which materially lessens the cost of construction, and avoids liability of leakage.

77,259.—IMPROVED APPARATUS FOR DISINTEGRATING ORES.—Jerome B. Cox, San Francisco, Cal.:

I claim disintegrating or reducing any gold bearing material by means of agitation

and friction with water, so as to permit of the separation of the gold from such disintegrated material by the ordinary means of sluice-box, amalgamation, etc.

77,273.—IMPROVED TRESTLE.—James E. Gedney, Petaluma, Cal.:

1. I claim the legs B, attached to the beam A, by means of the plates D, bolts E, and thumb-nuts F, as herein shown and described, and for the purposes set forth.

2. The combination of the beam A, extension legs C, legs B, removable plates D, having sockets d', and flanges for the passage of the bolts E, the bolts I, J, thumb-nuts K, L, and plates M, N, as herein described for the purpose specified.

3. Securing the extension legs C, to the legs B, by means of the bolts I and J, thumb-nuts K and L, and plates M and N, as herein shown and described, and for the purpose set forth.

77,297.—IMPROVED TIRE SHRINKER.—John Macy, Pine Grove, Oregon:

I claim the fixed bed B, provided with the fixed and adjustable clamps a, a', in combination with the sliding plate C, actuated by the cam-lever D, and the clamps G, G', fitted to the uprights E, E, F, F, when all said parts are constructed and arranged in the manner substantially as and for the purpose set forth.

77,343.—IMPROVED MEDICAL COMPOUND.—Robert Alexander, Eugene City, Oregon:

I claim the combination of the foregoing mixtures of medicines, to be used for the cure of cancer in the human system.

NEW INCORPORATIONS.—Articles of incorporation have been recently filed in the County Clerk's office in this city as follows:

CITY LAND HOMESTEAD ASSOCIATION.—May 18th. Capital stock, \$216,000; 2,400 shares, \$90 each. Trustees: Jos. Frontin, E. B. Clements and J. C. Duncan.

PACIFIC PUMP MANUFACTURING CO.—May 18th. Capital stock, \$500,000; 5,000 shares, \$100 each. Trustees: R. E. Brewster, E. J. Weeks, Chas. Hosmer and T. A. Mudge.

THE BADGER HILL AND CHEROKEE GRAVEL MINING CO.—May 20th. Capital stock, \$250,000; 2,500 shares, \$100 each. Trustees: J. B. Cook, Jno. McCarthy and Wm. Weight.

CALIFORNIA FUSE MANUFACTURING CO.—May 23d. Capital stock, \$50,000. Trustees: A. E. Davis, James Eya, Wm. Clift, Jos. Powling and Edward Northey.

The Nagle & Corcoran Mill Co. have filed an application to be reincorporated.

The Bacon M. & M. Co. have increased their capital stock to \$800,000.

The following articles of incorporation have been filed at the Secretary of States' office:

NEW YORK HILL QUARTZ MINING CO.—Capital stock, \$150,000; 1,500 shares, \$100 each. Trustees: J. K. Byrne, A. B. Brady, J. J. Sykes, Jno. Anderson and Reuben Leach.

UNIVERSITY HOMESTEAD, RAILROAD AND UNIVERSITY GARDEN CO.—Capital stock, \$120,000; 2,400 shares, \$50 each. Trustees: Samuel L. Theller, Jasper Bahcock, Thos. B. Lewis and Henry Vichier.

GARDEN CITY GOLD MINING CO.—Capital stock, \$200,000; 4,000 shares, \$50 each. Trustees: Albert Cramer, Albert S. Evers and O. D. Squires.

THE CONSOLIDATED VIRGINIA MINING CO. has increased its capital stock to \$3,480,000, to be divided into 11,600 shares.

U. S. FIRE EXTINGUISHER CO.—Messrs. Levey & Haley—Gentlemen:—We had the pleasure of seeing the successful working of your Fire Extinguisher last evening. A two-roomed house was erected, fully twenty feet in length, and both apartments were fired simultaneously; and when the whole building was one sheet of flame, almost instantly, on the application of the gas, the blaze was subdued, and, by the application of a few jets of liquid to the embers that remained in the interstices of the roof and walls, the whole was but a charred mass. We cheerfully recommend them for general use to all property owners, for in our opinion a fire cannot do much damage when these machines are properly applied.

A. H. JAYNE.
B. F. PENDLETON.
J. A. HOBART.
F. M. CAMPBELL.
D. G. BARNES.

Members of the Council of the City of Oakland. May 2, 1868.

SIXTY-FIVE HUNDRED TONS OF TEA.—It is estimated that 13,000,000 pounds of tea will be shipped to the United States this season from China.

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board

SAN FRANCISCO SATURDAY MORNING,
May 24, 1888.

Financial.

Under the legitimate demand for business purposes and new enterprises our money market continues to exhibit a sustained activity. The supply is, however, quite equal to the demand, and no difficulty is experienced in meeting all wants. Discounts are readily effected at 1 1/4 per cent. per month, and call loans, on good collateral, at 1 per cent. The Savings Banks obtain 1 per cent. on loans repayable in installments, and on this basis their business is brisk. Mining shares, of even the best claims, are not considered very acceptable security at present, the market being altogether too fluctuating and unreliable. As a consequence, margins have been much widened. Our supply of bullion is rather light, and not quite equal to the demand. For steamer purposes on the 21st inst., Gold Bars ruled at \$90.50, and Silver Bars from 1/4 discount to 1/2 premium. There is a surplus of Silver coin to such an extent that it is at a discount of 1/4 per cent. Currency Bills on Atlantic cities are quotable at 37 1/2 per cent. premium on Gold; Sight Drafts, payable in coin, 1 per cent.; Telegraphic Transfers, 1 1/2; Sterling Exchange, 4 1/2; Commercial Exchange, 4 1/2. Mexican Dollars are worth 4 1/2 per cent. premium. In this connection we observe that the Hongkong mint has been discontinued on account of the annual loss sustained by that Government during its operations. This may have some ultimate effect on the price of Mexican dollars.

It is really astonishing that at a time when the nation is laboring under a cloud of debt, and financial men are racking their brains to discover the best way to get rid of the burden, and insurmountable political demagogues are advising repudiation, that the establishment of a Branch Mint at the Dalles, Oregon, should be seriously projected and determined. We venture to affirm that it will be impossible to collect thirty thousand ounces of gold at that place in the course of a year. It has evidently been got up in the interest of a small army of local politicians, who are to be supported at the expense of the Government. Such legislation can only be regarded as outrageous and unwarrantable. A rigid investigation into Government contracts in Oregon would also probably result in saving a few hundred thousand dollars yearly to the nation. We would strenuously call the attention of headquarters to this gentle hint.

The North American Steamship Company's steamer Oregonian, which sailed on the 20th for Panama, cost \$196,771 in silver bars, and gold shipment was made by her. Our largest treasure shipment this year was by the Pacific Mail Steamship Company's steamer Golden Age, which sailed on the 14th inst. with \$1,000,000. The Pacific Mail Company's steamer Sacramento sailed yesterday for Panama, carrying \$676,436.20, of which \$329,833.59 was in gold bars, \$133,256.63 in silver bars, and \$28,146.06 in coin.

The operations of our newly established Labor Exchange have been so far very satisfactory. A great many people have obtained work, and the wants of many requiring operatives have been filled through its instrumentality. Our farmers are complaining of the want of hands to take off the rapidly maturing crops, and if the hundreds of idlers in our streets really mean that they want to work, they can be accommodated by the Exchange.

City Stocks.

Sales have been small, the activity in the mining share market absorbing all the attention of stock dealers. Most large transactions of miscellaneous stocks are usually negotiated outside the board, as we have noted from time to time as transactions have come to our knowledge. During the past week, in the board, sales of Spring Valley Water Company stock have been made at \$59.50, and California Steam Navigation Company at 70 per cent. Insurance stocks are dull. It is rumored that a number of our local companies will soon take steps to disincorporate. A meeting of the stockholders of the San Francisco Insurance Company takes place this afternoon. A note from the President of the Builders' Insurance Company states that they are "paying two per cent. per month dividends on the stock." For quotations of miscellaneous stocks see third page of this circular.

The receipts of the local insurance companies during the month of April, and previously this year, according to the returns made to the Internal Revenue Department, have been as follows:

	April.	Previously this year.	Total.
Pacific.....	\$52,248	\$153,561	\$205,809
Union.....	37,111	103,402	140,513
National.....	69,436	109,934	179,370
Fireman's Fund.....	20,222	57,614	77,836
Builders'.....	18,844	53,329	72,173
California.....	12,596	33,395	45,991
Merchants' Mutual Marine.....	16,381	52,181	68,562
Occidental.....	1,303	16,028	17,331
Home Mutual.....	5,244	29,800	35,044
San Francisco.....	5,349	13,532	18,881
Peoples.....	1,061	20,073	21,134
Totals.....	\$220,061	\$674,940	\$894,001

The returns were made upon a legal tender basis, the rate 72 cents for January, 71 cents for February, 72 cents for March and 72 cents for April—being fixed every month by the Assessor of the district.

The above statement shows a decrease of \$1,093 as against the receipts in February. The receipts of the several companies in April, as compared with March, show the following difference:

	Increase.	Decrease.
Pacific.....	\$4,400	\$9,751
Union.....	17,104	2,935
National.....	1,628	900
Fireman's Fund.....	1,000	8,308
Builders'.....	1,000	1,250
California.....	1,000	69
Merchants' Mutual Marine.....	1,000	2,241
Occidental.....	1,000	
Home Mutual.....	1,000	
San Francisco.....	1,000	
Peoples.....	1,000	

The receipts of the city railroads for the month of April, and previously this year, have been as follows:

	April.	Previously this year.	Total.
Omnibus.....	\$23,343	\$67,393	\$90,736
North Beach & Mission.....	21,154	61,003	82,157
Central.....	12,853	37,329	50,182
Front Street, Mission & Ocean.....	8,411	22,323	30,734
Market Street.....	19,837	19,837	39,674
Potrero and Bay View.....	1,793	4,147	5,940
Totals.....	\$70,984	\$212,834	\$283,818

On the 22d inst., the Market Street Railroad had not yet reported for the month of April. The receipts of April as against March show the following difference:

	Increase.	Decrease.
Omnibus.....	\$834	
North Beach and Mission.....	87	
Central.....	314	
Front Street, Mission and Ocean.....	413	
Market Street.....	24	
Potrero and Bay View.....		

Mining Share Market.

Since our last issue the mining share market has been characterized by greatly increased activity. On the 18th inst., at the morning session of the board, a sudden break occurred, and the fall of prices throughout the list was very rapid and material. This sudden movement created a panic of no small moment, and the cry for increase of margin on time sales came like a dash upon speculative operators, while many suffered in no small degree by the collapse; however, the opportunity was availed of by the shrewd and calculating, who always argue that a sudden heavy depression is sure to be followed by a rally, and this transpired speedily, for in the afternoon board better prices obtained and so on the succeeding day, but since that time prices have been extremely fluctuating, and sales have been made at greatly reduced rates, bringing in free buyers at the decline.

SAVAGE—sold to a very large extent, falling from \$147 to \$117, rose to \$151, and closed at \$145. During the week ending May 16th 1,402 tons of ore were extracted, showing an approximate value of \$48 31 per ton, of which amount \$79 tons came from the south mine on the 4th level. There is a material improvement in the south mine on the fourth station, and in the north mine on the same level they are getting more ore as they raise up. The Gould & Curry Co., having drained the mine below this level, prospecting will be resumed towards the north level. On the fifth station, in the south mine, the drift is in good ore, and the breasts from the foot of winzes from the fourth level are said to be looking better. The shaft is now 88 feet in depth below the fifth station, and next week they intend to put in timbers for the sixth station.

IMPERIAL—dropped from \$226 to \$187 50, and closed at \$207 50. During the temporary stoppage of the machinery for alterations, the force is employed in cleaning out, repairing and lagging drifts. The large body of water with which they have to contend is still the great drawback to any knowledge of the ledge. They expected to start the machinery last evening.

CROWN POINT—fell from \$118 50 to \$99, rallied to \$116, declined to \$103, and closed at \$110. In the cross-cut carried east from the south drift on the 800 level, at a distance of fourteen feet, reached clay. The main shaft was twelve feet in depth below the 800 level on the 21st inst. For May account the receipts of bullion to date aggregate \$71,222 67.

HALE & NONCHES—dropped from \$120 to \$97 50 under large sales, and closed at \$103. The drift from the 1,030 level is in about 125 feet. In going west at foot of winze from the 930 level, at a depth of fifty-five feet, four feet of fair ore have been recently developed, but water has interfered compelling them to stop work.

CHOLLAR—FOTOST—declined from \$227 50 to \$200, advanced to \$230, then sold at \$202, and closed at \$215. During the week ending May 15th, 760 tons were extracted—414 tons coming from the Blue Wing station, and 226 from the Belviders; work has been suspended in the latter. In the new shaft the sinking goes on slowly, running in hard rock. On the 19th, 139 tons of ore were shipped to three different mills.

KENTUCK—also sold at a recession, declining from \$430 to \$400, and closed yesterday at \$415. The receipts to date for May account foot up \$44,176. OREAN receded from \$170 to \$155, and closed at \$160. On the 19th inst., the new shaft was 248 feet in depth. During the week ending May 19th, put in three sets of timbers and lowered the pump twice. At present sinking is progressing more favorably.

OVERMAN—sold at variable prices, declining from \$100 to \$70, improving to \$86, falling again to \$70, and closing at \$80. As predicted by us last week, an assessment of \$20 per share was levied on the 18th inst. Since our last issue, \$7,500 in bullion came to hand. YELLOW JACKET dropped from \$1,200 to \$950, improved to \$1,150, fell again to \$950, and closed at \$1,040. We have nothing of importance from this mine. It is reported that recent developments look less promising.

AMADOR—sold at \$290 per share. The bullion returns for the current month so far aggregate about \$25,000. GOULD & CURRY dropped from \$450 to \$325, rallied to \$450, then sold at \$400, and closed at \$430. The shaft has been relieved of the accumulated water. LADY BRYAN declined from \$37 50 to \$25, and at the close sold at \$32.

CONSOLIDATED VIRGINIA—was in the market at \$150 per share. This claim is located between the Gould & Curry and Ophir, and embraces the California, 300; Central No. 2, 100; Kinney, 50; White & Murphy, 210, and Sides, 500 feet. Its capital stock (\$3,480,000) is divided into 11,500 shares of \$300 each.

EMPIRE—sold at \$230 @ 200, closing at \$215. BELCHER fell from \$325 to \$270, and closed at \$300. EXCHEQUER declined from \$52 to \$35, and closed at \$43.

The sales in the Board during the past week have been as follows: Regular sessions, \$2,205,205; open sessions, \$546,807—total, \$2,752,012.

BRAINS.—The brain of Cuvier, the noted naturalist, was, we believe, the heaviest which has been recorded. Its weight was 50 1/2 ozs. That of the recently assassinated D'Arcy McGee is said to have weighed 50 ounces.

CONTINENTAL Life Insurance Company, 302 Montgomery street, corner of Pino.

CHINMEN are said to be buying up all the mining ground about Auburn.

By MAIL.—The Mining and Scientific Press will be sent by mail to any part of the civilized world. In case of removal subscribers have only to inform us of the post office address of their old and new location, and the paper will be sent accordingly.

MINING SHAREHOLDERS' DIRECTORY.

Mining Summary.

Tax following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

Alpine County.

Miner, May 9th: There is plenty of lower grade ore out at the I. X. L. The mine would now justify the erection of a small mill, there being ore enough in sight to keep it running.

The Merrimac Co. of New York, accept the proposition of the Winchester Co. to go into the Winchester tunnel and run it to the lode, thence drift along the lode to their own ground.

Amador County.

Ledger, May 16th: Phillip Seihenthaler's quartz mine above Volcano, is now down 50 ft., the vein $3\frac{1}{2}$ ft. wide, and the rock as rich as ever. Twenty-three tons from the top yielded \$1,040.

Mr. Langford, one of the owners of the Kennedy mine, has been contracting for the machinery for a 20-stamp mill. Contracts have been made, and the work will be under way in a few days. The engine is of 50 horse power.

Dispatch, 16th: The Amador Mining Co., at Sutter Creek, have purchased the quartz mill above the Eureka mine, from A. H. Rose, for \$10,000, and contemplate adding ten stamps more. They also will erect a 40-stamp mill on the site of the old Eureka mill.

Calaveras County.

San Andreas Register, May 16th: Pete Moro has opened a claim on the old Blue lead, near his own house, and is now at a depth of 10 or 12 ft., taking out some good paying dirt.

Kern County.

Havilah Courier, May 9th: The 10-stamp quartz mill of the Gold Hill Mining Co. at Sageland, was set in motion on Monday the 4th inst., and has been running smoothly ever since. This mill is crushing rock from the Gold Hill lead.

Capt. C. K. Hoteling is about to recommence operations on his mine, the Cherokee Dick, in the Pi-Ute district. Messrs. Stosser and Alexander of Watsonville, have lately purchased the one-sixth interest of Mr. I. M. Taylor, in the St. John mine and mill, for \$23,000.

We learn that a very rich quartz lode has been discovered in close proximity to the Long Tom Lode, by Joseph Woodworth, Esq., Superintendent, who has named it the Long Tom No. 2. The ledge is now being worked and is two ft. in width.

The 10-stamp mill of the Enterprise Co. commenced running April 10th. The Keystone State is the principal ledge of this company. Dr. G. W. Chase and others have several rich claims in the same district, Cottonwood, among which are the Relief and Sunbeam. We were shown about one dollar's worth of gold washed out from four pounds of the dirt found in the Relief lode.

Letter from Sageland: The St. John and Hortensia mines in the new El Dorado mining district, are the center of attraction here. A fine 12-stamp mill has now been running several months. The Burning Moscow, in the same district, is owned by Messrs. Hammel & Denker of Havilah. Their first run realized some \$1,300 from 52 tons of rock. A steam mill will soon be erected upon the Italian lead.

From the Watsonville *Pajaronian*, May 14: Mr. T. D. Alexander, Otto Stosser, Thomas Walker, and Mr. Taylor, returned to this place, on Tuesday, after an absence of about a month at their gold mine in Kern County. These gentlemen brought back with them the result of 23 days' work of a 12-stamp mill, in the shape of three bricks, worth in all \$11,000. [This is, we presume, the St. John mine above referred to.—Eps.]

Letter from White River to the Visalia *Delta*, May 13th: David B. James has rented the W. R. Co's mill and mine for one year, and proposes to commence getting out ore in a few days. Mr. Bullock is now at work on his claim on Grizzly Gulch. There are several other parties engaged in placer mining on Gordon and Rag Gulches, among which may be mentioned the Messrs. Perkins & Sewall, all I believe, making fair wages. Mr. Carter's mill, three miles west of the town, is not running at present, but will be as soon as repairs can be effected. They are taking out large quantities of good ore from the Sarah Campbell.

The Eclipse and other lodes, owned by A. S. Maltby, are well known.

About four miles south of this camp, at Eureka Flat, Messrs. Herholt & Marshall are finding 25-cent dirt. They are ground sluicing.

Mono County.

Dutch Flat Enquirer: We have just been shown a silver brick obtained from the Dozier Metallurgical Co's works, located at Benton, Mono Co., weighing some 38 ozs. The company expect shortly to be in condition to put up smelting works in the different districts where the common milling process has thus far proved a failure, with a guarantee of working the rock to within five per cent. of any correct assay yet obtained.

Nevada County.

Transcript May 12th: The claims along the Yuba are clear of water. Ashbough & Co., on the opposite side of the river, cleaned up a good round sum last week. The companies at Rocky Bar are at work with first rate prospects. At Mount Zion a prospect tunnel is being run. At Brandy Flat, the cement mines will be worked as soon as the Portuguese ditch is repaired. There is every prospect of a lively season.

The miners of Relief Hill are hard at work. Four companies are washing, one is prospecting, and another drifting. The Welch Co., after running 600 or 700 ft. into the hill, struck a channel of red gravel, five ft. deep, which yields from \$10 to \$12 to the car load. The Union Co. is working 20 men and running about 100 in. of water. They are washing in rich ground and will clean up this week. The Eagle Co. is washing with eight men, using 30 in. of water. They made a clean up last week, realizing considerably more than expenses. The What Cheer is working eight men, with 40 in. of water. The North Star is working 14 men, and running 40 in. of water, in good ground. The Welch Co. expect to get to washing about the 1st of July.

Same of 14th: The Norridgewalk mine started up on Monday last. They are pumping out the water preparatory to going to work upon the ledge.

Eshath & Co., opposite Washington, are working the old channel which runs into the Yuba opposite Washington. They are taking out big pay. A pan of dirt taken out from the bottom last week yielded \$85. The Eastern Co., on the same channel, are about starting up.

A contract has been let to take out 100 tons from the extension of the Sneath & Clay mine.

Same of 16th: The mining companies at Omega are all at work, with excellent prospects and abundance of water.

Gazette, 14th: John A. Emory and A. A. Mulloy, of this place, received yesterday a lease of the New York and Grass Valley Co's mill, (Sneath & Clay,) and will start it up on Monday as a custom mill. They have already over 300 tons of rock engaged. The mill is in excellent repair, has twelve stamps, and can crush from 16 to 20 tons per day.

From a gentleman from Washington we learn that the miners are going to work with a will. At Omega, there is plenty of work at \$3 per day for a least 40 more men.

Teams are hauling rock from Sigourney & Co's claims, near the Half Mile House, to the Oriental mill. About 100 tons of rock have been taken out, averaging over \$20 to the ton.

Same, 19th: The Jenson claim, at Scotch Flat, cleaned up 50 ozs. for 10 days' run yesterday. The South Yuba Co. adjoining, is working off a large amount of ground.

Excelsior.—Virginia *Enterprise*, May 14th: Mr. Chapellet, Supt. of the Mohawk and Montreal mine, says that the snow is still eight or ten ft. deep in Meadow Lake and about the same depth at the Mohawk and Montreal mine. At the Enterprise mine there was about six ft. of snow. The Enterprise Co. expect to start their mill about the 1st of June. They were packing in fire brick from Cisco with which to line their roasting furnaces. The Mohawk and Montreal Co. intend putting in five additional stamps, and will begin crushing their ores about the 15th of June. They have several hundred tons of ore ready for reduction.

Plumas County.

National, May 9th: The Lebanon Mill, Indian Valley, is running with closed doors, on account of difficulties arising out of disputed title to the property. The Whitney is quiet. The Crescent will be started in a few days. At the Indian Valley mills, we found everything in full blast. The Caledonia has not stopped a day since December. The company employ about 30 men in the mine and mill. The mine pays on an average about \$1,500 per week. The Fairchild Bros., at this mine, are working Pierson's steam process for amalgamating, with great success. Messrs. Jenkins & Kellogg's mill on North Cañon, near Round Valley, is in full operation. This mill is supplied with rock from their ledge at Cherokee, known as the Kittle ledge, of which the Caledonia is an extension. They

employ 30 men in their mine and mill, and crush about 25 tons of rock per day. Their last week's run yielded \$1,800. The mill pays, on an average, about \$6,000 per month.

Poorman's Creek correspondence of same: Gains & Winze are working seven men at present. They are well rigged, and will run day and night, when they get a little more water. Bradley & Rodgers have suspended for awhile; so have Tom Moores & Co. T. A. Turner is still hunting for the channel. Keely & Co. have been doing well all winter. Baird has been at work in the Wright ground, making but little. Ridel & Co. will commence ground sluicing soon, in the creek. The Blue Lead boys have commenced to work off their front gravel. It looks well. The Chinese Cos. are pitching in lively.

North Fork letter: The Dutch Hill Co. are ground sluicing day and night. Waggoner & Ferguson's water has failed. They took out big pay while it lasted. Nobody doing anything on Barker Hill. On Red Rock they are making the best possible use of the water, putting in full time. Everything quiet on the river.

Sierra County.

Yreka Union, May 9th: The Bay City Co. are bringing up a race to drain the lower portion of Indian Creek. They commence towards Scott River, and will tunnel for a long distance. This will make a large amount of mining ground workable that hitherto could not be worked for lack of drainage.

It is rumored that Hon. E. Steele has organized a company with a capital stock of \$200,000, for draining and working the lower portion of McAdams Creek.

Shasta County.

The Nevada *Gazette*, says: The Washington mill at French Gulch, cleaned up \$9,246.75 for April, leaving \$6,000 over expenses.

Yuba County.

Appeal, May 19th: A Brown's Valley correspondent writes us: The Rattlesnake—old Yuba—started up on the 6th inst. It is under the management of Mr. George H. Leland.

ARIZONA.

Prescott Miner, May 2d: The placer miners in Big Bug district, on Lynx Creek, the Hassayampa, and other localities in this vicinity, are making good wages. At the Vulture mine, near Wickenburg, a dry-washing machine has been in operation some time past. The machine is a success, and has panned out a great deal of gold. At Weaver, the Mexicans are said to be doing well. The Vulture Mining Co's 20-stamp mill which never stops, except for a short time every Sunday in order to clean-up, was, at latest dates from Wickenburg, pounding out plenty of gold. More machinery was being erected at the mill. Wickenburg's mill will soon be in running order. Both companies were getting very rich rock. Mining is being carried on extensively at Eureka and other points on the Colorado river. Ledges that were some years ago given up as "hard cases," are now producing gold and silver bullion. In the vicinity of La Paz, there are several rich ledges, upon which work is being done. Mr. Ravena's lode is said to be very rich. The copper mines, near Aubrey City, Williams' Fork, were, at latest dates, producing rich ore; but we fear that work will have to stop, owing to the hostile attitude of the Indians. We learn that the mine of Wm. H. Hardy, near Hardyville, on the Colorado, looks well. The Chase mill, six miles from Prescott, is nearly completed. Noyes & Curtiss expect to start it next week. Work upon the tunnel has commenced. We saw some of the Chase rock the other day, and it looked well. Kodick & Feland have started a new shaft on the Chase lode, out of which they are getting some very rich silver ore. Quartz mining in Big Bug and Walker's districts, is almost at a stand-still. In Turkey Creek district, a shaft is being sunk on the Gross lode.

COLORADO.

Denver News, April 29th: In California Gulch the Moyer lode has a three-foot crevice. A prospect at 40 ft. yielded four pwts. to the pan. The shaft on the Lake County lode is 25 feet deep, and the ore prospects one dollar to the pan. The Ida lode has not so wide a crevice. No work has yet been done in the gulch.

Mr. Chas. W. Lowe has sold to a Chicago company, claims from three to nineteen inclusive, in Fair Play Gulch, for \$15,000 cash.

Oro City correspondence: Prospecting is still prosecuted in Granite district with vigor, the number about Free Gold Hill is greater than at any time this season. Our greatest need here is a custom mill. An un-

limited amount of quartz can be raised, and the owners will pay liberal prices for working it.

Herald, April 29th: J. O. Stewart made a test run of 150 lbs. of Munsell ore, from which he obtained 52½ ozs. of silver, worth in coin \$70.87½. The cost was \$37.50, which leaves \$51.10. Mr. Miley has started the 8-stamp mill, North Clear Creek, on ore from the Bates or Hunter lode. We were shown 4 ozs. 5 pwts., the result of a clean-up from half a cord of ore from the Empire Co's claim on the Bates lode. Woodbury & Co. have hands at work putting 20 stamps into the old Eagle mill. The motive power will be water. Mr. John Boylan to-day started up the Gunnell Co's mill, Nevada Gulch, on ore from the Burroughs. The mill is in good repair. The Smith & Parmelee mine on the Gregory Extension, are now boasting ore. Gregory mill No. 1 started up 10 stamps yesterday, on ore for lessee of No. 11 Gregory. Mr. Peregrine is running two batteries, six stamps to each, on ore from No. 6, Running lode, Enterprise district. Gregory No. 1 stamp mill will be started up this week. Peter Rhu has his astras on Enreka Gulch running. He is working on mill tailings.

At Mill City, 200 tons of ore are lying at the mouth of the Snider Co's tunnel on the Albro lode. This tunnel is 200 ft. from the surface. The company has not yet developed its silver lodes sufficiently to make an estimate of their value. A run of 2,250 lbs. yielded \$219 coin value. Col. Hawkins has reached the Heron lode at 300 ft. from the surface. It looks well. The Lincoln Co. have reached 280 ft. from the surface. They have put up eight astras. The Piasaw Co., Mr. Reed, agent, have put up a large mill, in which will be used the Dodge crusher and astras. They have run a tunnel 200 ft. on the lode. Parties are fixing up the Copeland mill, putting in 10 astras.

Georgetown *Miner*, April 30th: Selected ore from the Nuckolls lode gave by assay, \$4,184.18 in silver coin, value to the ton. We understand that the ore vein in the east level, on the Brown lode, is now three ft. in width. The owners of the Terrible lode are building a wagon road from Brownville to their shaft. The Magnet lode, Griffith Mountain, is yielding some of the best ore we have ever seen in this district. The Clara Jane lode is being developed by an adit on the vein, showing two well defined walls, width of the crevice six ft., width of pay vein two ft., and by several assays rich in silver.

Register, April 30th: The Smith & Parmelee Co. have struck good ore in the Gregory side of their mine. Charles W. Mather is putting in an astras below the Cook & Kimball mill.

Last week, Bonzie & Co., Idaho, cleared up 15 ozs.—four men's work. On Saturday they struck a pocket better than ever, one pan from which yielded \$9.68. Meade & Blanchard got a little over 12 ozs. Theohold & Co. are getting seven pwts. per day to the hand. Cooper & Craven are sinking a shaft on the low bar opposite the mouth of Chicago Creek—have got down about 10 ft., and have encouraging indications.

DACOTAH.

Territorial Enterprise, May 7th: The Sweetwater fever in this region has died out. Of late we do not hear of the mines mentioned once in a week.

Colorado Register, April 30th: The excitement in the Sweetwater country about the vast gold mines in the Wind River and Big Horn valleys is said to be high. Parties arriving from the Sweetwater mines say the miners who struck those fabulous diggings have all returned to South Pass, disheartened.

IDAHO.

Owyhee *Avalanche*, May 2d: Geo. Collier Robbins is organizing a company to tunnel War Eagle Mountain, and already \$110,000 has been subscribed towards the enterprise by the chief mine and quartz mill owners, and business men in Owyhee. He will start for New York in a short time to complete the organization of the company. The tunnel will tap the mines at from 300 to 1,500 feet depth.

The Owyhee mill is running the full complement of 20 stamps day and night, and the company is prospering.

About 500 tons of Golden City Chariot rock is awaiting crushing at Sinker Creek mill.

Idaho *World*, May 6th: From G. W. Thatcher, and others from Centerville, we learn that an average season of mining was confidently expected about there. The water holds out better than was anticipated, and the mines pay exceedingly well. Water has been let into the diggings from the Ben. Wilson, Law & Waterman Big Ditch, and

times look lively and are prosperous in and about that camp.

MONTANA.

Helona Post, May 2d: Water is scarce. Two bedrock flumes have been put in Dry Gulch. Mr. O'Neil expected to take several thousand dollars this season, but will be unable to realize much with present prospects. The other flume was put in by a couple of Frenchmen, who have paid dirt 5 to 17 ft. in depth. In the upper part of the gulch several claims are being worked when water can be obtained. Butts & Co. sunk to the depth of 70 ft. through good pay dirt; bedrock not yet reached. In Tucker Gulch a hydraulic had been rigged up, but the scarcity of water has prevented its being used. In Big Indian, there is a better supply of water, yet the average has been only half a day since work commenced. All the claims worked are paying well. The owners of the Blue lode are sluicing into the hillsides. In Skylight Gulch, nothing is being done. There are some claims in the gulch which will pay from \$10 to \$20 a day to the man, with water.

Taylor, Thompson & Co. have started up their steam placer mining institution on claim No. 5 below discovery on Last Chance, and yesterday cleaned up over \$300 for a portion of a day's run.... Davis & Co.'s bedrock flume in Norwegian Gulch the first days' run cleaned up some \$23 to the land.... The last button from the Cable came last evening at six o'clock. Weight 418 ozs., value, \$7,842.... Noteware & Marshall have just finished a bedrock flume in Alder Gulch, near Elk Horn Bar and opposite Central, and commenced running.... Hayes & Williams, Bummer Dau Bar, opposite the city, are blasting through the bedrock in order to put in a set of sluices.... Mr. L. Bugher arrived from Phillipsburg last evening, reports work bravely going on, but deprecates the want of mills to crush ore. The St. L. & M. M. Co.'s mill was not running when he left.... Mr. Louis Bugher, of the Silver Hill Mining Co., recently made a successful experiment with ores from the Rumley-Bugher lode, in Flint Creek district. In a temporary experimenting pan, he run through about 400 lbs. of tailings with salt, and got 72 ozs. of silver, worth \$90 in currency.

Springville has about 300 miners in and about it. There are two mining districts, upper and lower Indian Creek, and some 1,000 claims recorded. The principal mining is done in Indian Creek and adjoining gulches. Six companies will soon begin operations. Maxwell & Co. are now at work with 40 in. of water, and cleaned up for three days with three men, \$650.

Deer Lodge items: Five bedrock flumes are in operation, or being put in, in Elk Creek, and owners are taking out from \$18 to \$40 per day to the hand. Water is plenty there. All the gulches tributary to Elk are yielding well.

Virginia items: A 5-oz. nugget has been found in Highland Gulch.... At Summit district the John Howe tunnel is progressing rapidly. It is now in 300 ft.... The Messler tunnel on the Butler lode, has been run 350 ft., and the workmen are now following a very rich streak some 12 inches in width. Workmen on the Keystone have taken out 300 or 400 tons of fine looking ore.... A 78-oz. gold brick is the latest from the Oro Cache.... The Sanderfer mill made a clean-up yesterday, 267.46 ozs., coin value, \$4,041.27.

Hot Spring district is paying \$10 per day. The gulch will give steady employment to a number during the summer. We learn that on Meadow Creek from \$7 to \$8 to the hand per day is being taken out.

Letter from Boulder Valley: In Peter and Boomerang Gulches, the claims, so far opened, establish the fact that they are good wages diggings.

Crow Creek mines: Radersburg, is the town of the Territory. The Leviathan is surprisingly rich. Five hundred dollars has been found in one panful of its rock, and some of the most beautiful free gold specimens ever found in the Territory. The crevice is from six to twelve inches, and a shaft is now being sunk for testing the lead. The Twilight paid \$40 to the ton in an astrak, until a depth of 20 ft. was attained, when the lead capped. The R. E. Lee has paid, on average rock, \$23.60 to the ton. Upon the Ohio, an incline 40 ft. in length has been run. It has panned out \$40 to the ton. The Keating lode has a shaft to the depth of 95 ft., and a tunnel 200 ft. in length, for draining.

Letter from Confederate Gulch: The Confederate Drain Ditch Co. is still going on with its work. In two months it is expected to reach the junction of Montana and Confederate Gulches.... On Boulder Bar, half a dozen claims are paying from \$10 to \$15 per day. A few claims are worked in the gulch.... In connection with

the great Boulder ditch, the company is constructing a bedrock flume in Montana Gulch, which is to be 780 ft. in length, 600 ft. of which is being paved with sheet iron. King & Gillette's flume is now 1,724 feet long. A ditch to fill it, 25 miles in length, from the head of Deep Creek, will be completed by fall. There are 200 laborers out of employment at Diamond City.

NEVADA.

Aurora Union, May 9th: Messrs. White and Greeley, as agents of the Bank of California, visited this place a few days ago, with a view of examining into the condition of the Del Monte and Antelope property, which have recently passed into their hands; also the Homestake property at Bodie. From remarks made by these gentlemen, we believe that the institution which they represent will, during the coming summer, prospect those mines.

It is probable that extensive reduction works will be erected at Castle Peak, 28 miles west of this place.

Territorial Enterprise, May 16th: Mr. Bourne, of Pino Grove, last evening brought in a gold brick weighing 34 lbs. avoirdupois, and worth about \$9,000, the result of a crushing of 240 tons of ore from the Midas mine, worked at the Pioneer mill.

The Wilson Co. are now engaged in taking out and crushing sulphure ore from the lower level of their mine. The last crushing yielded \$40 per ton. The mine looks exceedingly well. Reynolds & Co., who have a contract on the Central mine, are getting out ore, now being crushed, that will yield \$40 per ton. Palmer & Chevalier are working the Mountain View mine under a contract, and getting out ore that will pay about \$20 per ton.

The new 5 stamp mill of Abrams & Toombs, will start up next Monday. They have a contract on the Wilson mine, and have out between four and five hundred tons of ore.

Humboldt.

Register, May 16th: The Montezuma furnaces are in full blast. Mr. Likely, the foreman, tells us that this season he will cord up a mountain of bullion for the cars to haul to market. There are 500 tons of ore on hand, while the mine, to all appearance, is inexhaustible. There are many mines situated near the Humboldt river, and within a short distance of the line of the railroad, that will be worked by Mr. Nason's process of smelting.

The Arizona mine continues to improve in the shaft being sunk from the main level. The shaft is now down 60 feet, exposing a ledge at that depth of over three feet in thickness, of a very superior quality of ore. Gov. Fall is now working a large force of hands on the mine and mill. Business is improving and times look hopeful.

Independence Valley is a new mining field, 60 miles north of the Humboldt. There are now about 25 miners there, mostly engaged in placer mining, with considerable success. The gold obtained is worth about \$13 per ounce—is rather fine, and has the appearance of not having been long released from quartz. The day before he left, he saw three men take out \$100 from their claim. There are arrangements making, by a party from Austin, to put up a 10-stamp mill to work the ore of a ledge which they say will pay \$40 to the ton in gold, with ore enough above the surface of the ground to keep the mill running two years.

Pahranaagat.

Silver Bend Reporter, May 9th: We are informed by a gentleman from Logan, in the Pahranaagat section, that there is a party now at that place, engaged in testing the ores of that locality with a view to their reduction by smelting. The person making the test, has had large experience in the smelting business. Since his arrival he has made a great many tests upon a limited scale, and has met with success. He is now engaged in building a furnace capable of reducing a ton at a time. The furnace is a reverberatory, the ore is broken in small pieces, and with the flux is placed therein, and in four hours is reduced—producing a "cake" or "button" of bullion, and leaving as slag a mass of glass. The flux is known only to the operator, who says it is easily obtained all over the country, and costs but a trifle. But a small quantity of wood is used in the operation—about a cord and a half, we believe, to the ton of ore.

The mill of the Pahranaagat Valley Co. at Hiko, after a single run, has been compelled to stop for a while. The reason for this is, that the bricks of which the roasting furnaces were constructed, are made of unsuitable material and would not stand the required heat. This will be remedied soon, and the mill again started. About \$10,000

worth of bullion was the product of this run. The ore worked was from the surface and taken from several different mines, among which were the Indiana, Green Monster, Silver Chamber, and others.

Reese River.

Silver Bend Reporter, May 9th: From the back ledge of the Highbridge mine, the Combination Co. are at present taking out an immense amount of ore. There is estimated to be in sight near the surface a sufficient quantity to keep the mill at work for several months. The average yield of the ore which the mill is now reducing, both dry and wet, is \$100 per ton. Since our last issue, the Combination Co. has shipped bullion of the value of about \$10,000.

We have been informed that the Rutland mill at Reveille district has again been set in motion and is now at work. It is the intention of the owners to erect roasting furnaces.

Some remarkable developments have recently been made upon the El Dorado South. For 300 ft., the main portion of the ledge is composed of high grade chloride ore, working an average of near \$500 per ton. The depth reached upon this surface working is 15 ft., with no diminution in quantity or quality. In the incline at a depth of 125 ft. from the surface, a large body of wonderfully rich sulphure ore has also been disclosed, exceeding anything heretofore found in the mine. The company now have ready for the mill 200 tons of first class ore.

The Belmont Co. have been making some alterations about their mill, in consequence of which it has been idle for about 10 days. It will be in motion, probably, on Monday. At present there is a supply of ore at the mill from the back ledge of the Highbridge, and teams are constantly hauling more.

The new mill of Antonio Borgues, a half mile south of the El Dorado mine, will probably start up to-day. It has a battery of three stamps—to which two more are to be added soon—and will be used in reducing ore from the Arizona.

Another new mining region has been found, and named Sheridan district. The principal locations are respectively named Nevada Giant, 10 ft. wide; Potosi, six feet, and the Evans ledge, the two first named running parallel and cropping boldly for a distance of five miles. Along the immense croppings, at intervals, large ore chimneys occur of such magnitude that thousands of tons of rich ore are said to be revealed to sight. The ore assays from \$100 to \$300 per ton. The location of the new district is about 10 or 12 miles southwest of Penoyer's spring on the Pahranaagat road, and perhaps nearly 45 miles southeast of Reveille district.

The prospect now is that a company of English capitalists will soon have an agent at Manhattan who will commence extensive operations there. Mr. Bauer arrived here during the week and is now engaged in surveying timber lands, water privileges, etc., in the district for the benefit of the company. Mr. J. H. Boalt, a well known mining engineer, will shortly arrive and report upon the property.

Letter from Ophir Cañon: The present summer bids fair to eclipse any previous season. It is pretty well understood that a vigorous working of several mines will be carried shortly; the Antocrat, in this cañon, the Eclipse in Summit, and the Brown & Spiker in Wisconsin. The latter has been worked upon as steadily as the weather would permit for several months; an incline to a depth of 130 ft. is now completed which discloses a fine body of very rich ore.

The La Plata Co. will complete their mill at Park Cañon this season. I have it pretty direct that work will be resumed within a week or two.

Austin Reveille, May 12th: To-day some 2,000 ozs. of crude bullion arrived in the city from Rigby's mill at San Antonio.

Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

Territorial Enterprise, May 12th: The Imperial mill, Lower Gold Hill, has stopped for repairs. The machinery will be overhauled and the mill ready to run in a week.

The Sierra Nevada Co. are having another big plunger pump constructed. The bore of the pipe is 14 inches, and the pump rod will have 14 feet stroke.

Yesterday at noon the new Imperial-Empire shaft had been reduced to six or eight ft. below the floors of the drifts. Drifting will probably be resumed to-day.

Same of 14th: The cave in the United States shaft was not so great as stated. The cave occurred near the bottom of the shaft, and only about five tons slid in. The com-

pany will now properly timber the shaft. The rock is still soft.

Same of 15th: The Bullion Co. are now running a drift from the bottom of their main shaft, at a depth of 1,200 below the surface.

16th: From the office of Wells, Fargo & Co., in this city, there were shipped during the past week, 5,214 pounds of assayed bullion, valued at \$136,038.53; from the office of Wells, Fargo & Co., Gold Hill, 4,563 pounds, valued at \$128,243.42.

Trespass, 16th: Work in the Sierra Nevada shaft now progresses steadily and favorably, and this morning a depth of 72 ft. had been attained, without any obstacles to encounter in the way of water or hard rock.... The Ophir shaft is now 249 ft. in depth, with considerable water.... Pumping continues at the Gould & Curry mine, and doubtless will during the summer.... In the Savage, at the north, ore is not looking as well. At the south, there is a slight improvement.... In Chollar-Potosi, the incline is being sunk slowly, averaging about 3½ ft. daily.... Bullion is putting in a new set of reels.... In Imperial, the management of the new shaft continues unchanged, and is beset with misfortunes. Last night another cage accident occurred, and water was profuse in the drift this morning.... Cole has a very narrow but extremely rich vein of ore being drifted on with no apparent change.... The United States shaft is in promising quartz, and now down about 60 ft.... In Kentuck, the various levels of the mine are looking extremely well. In the shaft, considerable water has been encountered, but not enough to impede labor. The Crown Point mine is looking extraordinarily well, and the body of the ore south, lower level, has widened and improved in quality.... In Belcher, no change in the appearance of cross-cut at the 800-foot level.

NEW MEXICO.

A letter to the Star, dated April 1st, from Mr. Henry Monson, says of the Cimmaron mines: I have been here about two months and have not seen anything better than we have in Colorado. The snow has been from one to four feet deep ever since I came here. I think there are some good lodes here, or I would not remain a day. The great drawback here is the want of water. I don't like the country as well as I do the South Park, Colorado, and I think there is more snow here than there is there. Wages for good miners is \$1.50 per day.

OREGON.

Dalles Mountaineer, May 9th: Major Sanderson of Warren's camp, has been here on his way from the Atlantic States. He was taking with him a 5-stamp mill which would be put in operation as soon as it should arrive in the diggings.

The La Grande Times says that the quartz mining in Eagle Creek district is very prosperously conducted. The Humboldt Co. have a 10-stamp mill, and the La Grande Co. are putting up a mill of like capacity at Gem City, to be in working order July 1st.

WASHINGTON.

Olympia Transcript, May 2d: The party of prospectors to the Black Hills returned on last Saturday evening, and report nothing found to justify them in remaining longer. They found a little "color" in places, the same as can be panned out anywhere in the streams half a mile from Olympia, but not enough to pay to work.

THE LONDON TIMES PRINTING OFFICE.—

When a compositor applies for employment on the Times, he is tested, in a room by himself, upon a piece of Parliamentary debate "copy," which is usually written in a not over-legible style, in abbreviated long-hand. If the applicant can compose sixty lines of minion in a fairly workmanlike manner, without "donblets," "outs," wrong spellings, or a disproportionate number of literal or clerical errors, within two hours, his name is placed on a register of competent hands, and he may expect to be called in at the first opportunity. Once engaged, the permanency of his post depends upon himself. No applicant over thirty years is eligible, and if he fail upon trial to come up to the required standard of efficiency, he is paid for his sixty lines and dismissed—no one but the manager and himself being acquainted with the fact of his application. Men are encouraged in provident habits as soon as they attach themselves to the paper. Half a crown in the pound is deducted from the earnings of each regular compositor, pressman, machineman and warehouseman, which sum accumulates at interest during the whole period of his employment, and is given up to him on his retirement, and on no account before.—Bookseller.

"Antiquity of Man."

Canvassing Agents.

San Francisco:

Saturday Morning, May 23, 1868.

Notices to Correspondents.

VULCAN, JR.—The phenomena associated with the late volcanic eruption at the Sandwich Islands, are perfectly compatible with all former theories, which attributed such commotions to the influences exercised by a molten center. We look forward with considerable interest for further accounts, especially for well authenticated accounts, as to how the levels of molten matter stood in the craters of Mauna Loa and Kilanea before, at the time of and subsequent to, the recent outbreak.

Above these beds, rests a bed of peat about twenty-six feet thick. It has been supposed, by those who have heretofore given their opinion in regard to the antiquity of the remains, not only that the gravel beds were the gradual result of the almost imperceptible deposition from the stream which is still going on,—and that this formation must therefore have required ages,—but that the peat bed above must have occupied more than 20,000 years for its accumulation. But Prof. Andrews, by what seems incontrovertible reasoning, establishes the facts, first, that the river was once immensely larger than at the present time,—and second, that the deposition of gravel was, at least in places, extremely rapid. This is shown by the unmistakable evidence that blocks of ice, three or four feet in diameter, containing gravel, had been laid down in the strata and completely covered by other horizontal strata before they had time to melt. The sinking in and fracture of the stratum above, upon the subsequent melting of the ice, producing an arrangement not to be accounted for upon any other supposition, would alone prove this; but in further confirmation of it, he adds that the fragments of soft chalk gravel, which the ice brought with it, still retain their sharp angles and edges,—which would have been impossible if they had been rolled even a hundred feet in the bed of a stream. A further evidence of the agency of ice, is seen in the fact that boulders of sandstone are formed, some of which are large enough to weigh a ton. These must have been transported from far up the stream; for the rock in the vicinity is not of that character.

The deposition of the gravel beds, then, must have occupied much less time than has been estimated. In regard to the overlying peat, the estimate has been equally erroneous; being based upon the irrelevant fact that there has been no perceptible addition to its depth, "within the memory of the oldest inhabitant." M. Boucher de Perthes of Albeville, who has made most of the discoveries in this valley, therefore concludes that its average increase has not exceeded one and a half or two inches in a century. As the total thickness of the bed is, as we have said, about twenty-six feet, this would give it an age of, say, 20,000 years. Prof. Andrews shows the absurdity of this, from M. de Perthes' own facts; he having elsewhere stated that he has found, in this peat, trunks of larch and alder trees *in situ*, some three feet or more in height. Now it would take 2,500 years or so to cover such a stump at the rate given above as the average rate of deposition of the peat. But even an oak stump would not last a twentieth part of that time, much less one of birch or alder. Every trace of it would long before have disappeared. The deposition must therefore have been much more rapid than above supposed; for oak logs have been found in the peat, which were so sound that they were manufactured into furniture. The calculation of the average rate, based upon the present rate of deposition, is plainly erroneous, inasmuch as the peat beds of the Somme Valley belong to the class of forest peats, and that valley lost its forests centuries ago.

Prof. Andrews arrives at the conclusion, that the peat beds overlying the gravel deposits in which the remains were found, re-

quired, instead of 20,000 years, only about 6,000, for their formation.

The gravel cones at Villeneuve, on Lake Geneva, were also visited by Prof. Andrews. Morlot has assigned an age of 11,000 years to the lowest of these cones. Prof. A. makes it less than half of that; and points out a singular error in Morlot's data, which must necessarily vitiate his entire calculation. This error is the taking too small a unit of measure as the annual accretion of the cone,—assuming that the increase in depth has been from the commencement the same as now; whereas it is obvious that the total amount of earth brought down yearly by the torrent which has formed the cone, having of course been spread over its whole surface, must have added a thinner layer each year, as that surface grew larger. In addition to this extraordinary oversight, the calculations of Morlot in regard to the upper and larger cone,—for there are two,—are further vitiated by the assumption that the rate of deposition is the same in both, whereas there is ample proof, here as in the valley of the Somme, that the stream was formerly very much larger than at present; the rate of accretion must therefore have been more rapid, and consequently the time occupied in the formation of the upper cone proportionally shorter.

FAMILY ICE PRODUCERS.—Dr. J. A. Bauer, druggist, 644 Washington street, has shown us a neat, convenient and portable machine for making ice in small quantities. The apparatus is constructed of different sizes, capable of making from one to six or eight pounds at each operation. The smallest one does not occupy a space much larger than that filled by a gallon measure, and will not weigh more than three or four pounds. The refrigeratory process is exceedingly simple, and is produced by the mixture of equal parts of carbonate of soda and nitrate of ammonia, with water sufficient to dissolve them. The mixture of these ingredients produces a cold of great intensity, by which a solid cylinder of ice is obtained in from ten to twelve minutes. The cooling ingredients are placed in an outer chamber, surrounding a central one, in which the water to be frozen is placed. Both chambers are securely closed, and the machine revolved, end over end, in a convenient frame, which comprises a part of the apparatus, during the time required for the formation of the ice. We understand that a large number of these machines have been sold to private families and to persons going upon steamers, etc. Several have been taken down to the arid plains of Arizona, and the party which recently left this city on a visit to the volcano at the Sandwich Islands, supplied themselves with this convenient refrigerator. The cost of ice made in this manner, on a small scale, is from eighteen to twenty-five cents per pound.

BLASTING AT LIME POINT.—Our readers are aware that the Government is preparing a site for the fort to be erected at Lime Point. For this purpose it is necessary to remove a considerable portion of the hill at that place. On the 16th inst., a blast of 7,500 pounds of powder was fired. A tunnel had been run into the hill to the depth of sixty feet, and a drift thence at right angles for the same distance. A chamber was excavated at that point, in which was placed 4,000 pounds of powder; a wire having been connected with this, the drift was then filled up with dirt for forty-five feet, when 3,500 pounds more of powder was placed in another chamber. The whole tunnel was then filled up to its mouth.

The charges were simultaneously fired, by means of a magneto-electric machine. An eye-witness says that no noise was heard, but that "the whole face of the hill in front of the drift was seen to move outwards and fall into the sea." About eighty thousand tons of rock was displaced.

Volatility of Gold and Silver.

It has been long known to metallurgists, that both gold and silver are, under certain circumstances, to some extent volatile; but Napier has shown, as published in the *Quarterly Journal* of the Chemical Society, London, 1857, that when an alloy of these metals is kept in a state of fusion at a high temperature, they are very distinctly so. By collecting the metallic vapors escaping from a crucible containing from twenty-five to thirty pounds of melted alloy (gold coin), the results obtained in two instances were respectively as follows:

Vapor collected.	Pure <i>g</i> -Id in vapor.
grains	grains.
1—4.80	4.50
2—4.40	4.10

Deposits obtained from top, middle, and bottom of a chimney thirty-five feet in high, attached to a small furnace used for fusing an alloy of silver and copper (silver coin), gave the following results:

	<i>Top.</i> <i>per cent.</i>	<i>Middle.</i> <i>per cent.</i>	<i>Bottom.</i> <i>per cent.</i>
Metallie Silver.....	3.80	9.19	29.95
Oxide of Silver....	7.13	5.21	0.17

Deposits were also examined from the top, middle, and bottom of a chimney attached to a furnace in which an alloy of silver containing a considerable portion of gold was melted, with the following results :

	<i>Top.</i>	<i>Middle.</i>	<i>Bottom.</i>
Metallic Silver.....	29 380	39 160	48 750
Oxide of Silver.....	1.982	3 140	0.082
Gold	2 120	2.640	4.250

Makins has corroborated these results by experiments on deposits obtained from a flue attached to a muffle in which assays of an alloy of gold and silver had been made. In his experiments, according to a subsequent publication in the *Quarterly Journal* of the Chemical Society, 1,000 grains of this deposit gave—

Gold.....	0.087
Silver.....	0.763

The lead carried off in the form of fume, during the metallurgical treatment of argentiferous galena, is invariably found to contain a certain proportion of silver, but the lead resulting from its re-treatment is always much less rich in silver than that obtained directly from the ores.

The following results, obtained from samples of fume taken at different points along the course of a flue leading to the stack of a lead-smelting establishment, in which the work lead contained, on an average, twenty-six ounces of silver per ton, showing the relative volatility of the two metals when subjected to the heat of a Castilian furnace :

No.	FROM TOP OF FLUX.	Lead, per cent.	Silver per ton. of ore.

AMERICAN IMPROVED GAS LIGHT.—MR. David Bush, who introduced the above light here last summer, has returned from the Eastern States, where he has been to examine the latest improvements and make arrangements for its successful introduction here, where we understand a company is to be formed. It has been in practical operation in some of our large buildings, for the last ten months; thus it seems we are to have a good and cheap light at last.

PETROLEUM CASKS.—The *American Artisan* says that a strong solution of glue will when dry, serve as a coating for the interior of casks intended to contain petroleum, which will be perfectly impermeable to the oil. A point worthy of consideration in the storing of petroleum for fuel in steam vessels, is the fact, pointed out by M. Deville, that it increases in bulk one-hundredth of its volume for every ten degrees centigrade of heat. Space should therefore be left in the casks to permit any probable expansion, otherwise they might burst.

The Paris Exposition Reports.

We have received from Prof. Wm. P. Blake, California Commissioner to the Paris Exposition, the Prefatory Report of Hon. N. M. Beckwith, Commissioner-General for the United States at that Exposition, giving an amended list of the awards to the U. S. exhibitors. The awards to exhibitors from this coast have already been published in the columns of the MINING AND SCIENTIFIC PRESS. Mr. Beckwith's report gives a list of the special reports which have already been submitted, or which may be expected. This list is as follows:

On new inventions, scientific apparatus, and instruments of precision, by Professor F. A. P. Barnard, of New York.

On methods and processes in chemical science, etc., etc., by Prof. J. Lawrence Smith, of Kentucky.

On the transmission of intelligence, by Prof. S. F. B. Morse, of New York.

On Bessemer steel, and on iron and steel, by Mr. Abram S. Hewitt, of New York.

On railway materials, locomotives, and marine engines, by Mr. W. S. Auchincloss, civil engineer, of New York.

On minerals, agricultural products, and on inland and ocean transportation, by Mr. S. B. Ruggles, of New York.

On important products in science and art, by Mr. C. B. Seymour, of New York.

On instruments and apparatus of surgery, surgical dentistry, and military sanitary institutions, by T. W. Evans, M.D., of Paris, France.

On the fabrication of beton, concrete, cements, and construction of sewers, tanks, wells, etc., etc., by Mr. L. F. Beckwith, civil engineer, of New York.

On asphalts and bitumen, and the construction of streets, sidewalks, etc., etc., and on macadamized roads, by Mr. Arthur Beckwith, civil engineer, of New York.

On the culture and manufacture of silk, by Mr. E. C. Cowdin, of New York.

On fire-arms and materials of war, by Mr. C. B. Norton, of New York.

On pianos and musical instruments, and on clothing, by Mr. Paron Stephens, of Massachusetts.

On the preparation of food, by Wm. E. Johnston, M.D., of Paris, France.

On the practical application of fine arts, by Mr. Frank Leslie, of Philadelphia.

On educational apparatus, by Prof. J. W. Hoyt, of Wisconsin.

On building materials and methods of building, by Mr. J. H. Bowen, of Illinois.

On education, school-houses, etc., by Mr. J. R. Freeze, of New Jersey.

On wools and agricultural products, by Mr. J. P. Reynolds, of Illinois.

On woolen manufactures, etc., by Mr. E. R. Mudge, of Massachusetts.

On gold, silver, and precious metals, by Prof. Wm. P. Blake, of San Francisco.

On the vine and its culture, and on horticulture, pomology, etc., by Messrs. M. P. Wilder, of Boston, Mass., Wm. J. Flagg, of Ohio, and A. Thompson, of New York.

On minerals and metallurgy; apparatus for boring tunnels; apparatus for rock-breaking and stamping, washing and separating ores and minerals; pressed coal, its uses, etc., etc.; precious metals; sugar-beet and beet-sugar; trans-atlantic cable; sewing machines, and copper and coal, by H. F. Q. d'Aligny, mining and civil engineer, of Michigan.

It will be noticed that these reports are all from professional men, whose established reputation in their respective specialties will be a sufficient guarantee of the thoroughness and accuracy of the information which they will communicate to the public. Never before was such an array of practical talent brought together in this country to examine and report upon the best fruits of the industry and skill of the world. The idea is a grand and noble one. Twenty-five men, who have been long devoted to special studies, each one of whom is perfectly familiar, not only with the first principles involved in the department of industry to which he has been assigned, but also with the practical application thereof in all its details, have been appointed to write essays on nearly all the various departments of labor which enter into the industrial pursuits of man.

In the struggle to gratify human wants, scientific, mechanical and industrial progress is very unequally developed in different countries; but the bringing together of the best fruits of such industry in a grand

exhibition of the world's skill and progress facilitates, in an eminent degree, the exchange and diffusion of the various kinds and methods of production, and thereby equalizes, to a great extent, the common stock of knowledge. The advantages of such exhibitions have long been felt and acknowledged.

In order to render the results of the Paris Exposition still more widely beneficial, the National Government arranged the Commission, to which reference has been made, with the especial view of collecting for publication and general distribution every important fact of practical value. How well that commission has been executed may be inferred from the judicious assignment of duties, which has been made, and from the assiduity, ability and zeal which has thus far been developed in the performance of the work.

The only special report which has yet reached us is that of Mr. A. S. Hewitt, on "The Production of Iron and Steel in its Economic and Social Relations." This report occupies 104 closely-printed pages, and gives a general expose of the present condition of the iron manufacture throughout the world. The various iron manufactures of this country are compared with those of Europe; relative costs of material and labor are given, as well as reference to the moral and intellectual condition of the workmen in these two quarters of the globe. We are indebted to Professor Blake for a copy of the report.

We learn from our Eastern exchanges that Mr. E. C. Cowdin has also sent to the Secretary of the Treasury his report on the subject of "Silk and Silk Manufactures," in which he shows that it is perfectly practicable for the United States to supply herself with raw silks, without any reliance whatever on foreign countries.

Professor Blake writes us that he has prepared and sent to Mr. Hoag, Secretary of the State Agricultural Society (from which Society, as well as from the State, he held a commission), a report, which we presume will appear in the forthcoming annual report of that Society, which is now in the hands of the printers. The Professor also writes us that in January last he sent a report upon the Exposition to Governor Haight—a manuscript of about 150 pages—from which he has not yet heard. We have seen no notice of such a document being communicated to the Legislature; but presume it has been so communicated, or disposed of in some other way, through which it will soon be placed before the public. We presume this report is the one set down to the Professor in our special list "On Gold, Silver and the Precious Metals." It is probably now in the hands of the State Printer—where the mills grind slowly.

The Professor has also communicated the above facts, officially, to Albert S. Evans, Secretary of the General Committee of the Paris Exposition for the State of California, together with the following, which will be of interest to those in this State to whom medals have been awarded:

"The medals [awarded to U. S. exhibitors] have been received here [Washington], and will be exhibited, in a few days, in the old hall of the House of Representatives. * * * When the medals are ready for distribution, it will be necessary for the parties for whom they are intended to either claim them in person or authorize some one to receive the medals and receipt for them. As I shall probably be here, I will be happy to attend to this for those of our State who desire and authorize me to do so, and I will forward the medals by Wells, Fargo & Co's Express, or as may be directed."

The "Pictured Rocks," whose origin and constituents a few weeks ago elicited so much discussion in our columns, may be seen for a short time at Woodward's Gardens. While an interesting subject of study to the scientist, they are an object of curiosity to all.

NATURAL ILLUMINATING GAS.—Sources of natural gas have been discovered in several places near the city of New Orleans. It is only necessary to sink an iron tube to a depth of forty feet, when the gas begins to flow out at the rate of five feet per hour, and is accumulated in suitable reservoirs. It burns with a clear, white flame, equal, it is said, to the best purified coal gas.

AN ERROR.—There is a statement going the rounds of the press, purporting to be from the MINING AND SCIENTIFIC PRESS, to the effect that the type metal furnished from the Montezuma Smelting Works, in Humboldt county, is composed of thirty parts of lead and seventy parts of silver. It should read thirty parts of lead and seventy parts of antimony—the silver having been separated from the base metals by calcination and cupelling.—Humboldt Register.

The fact was correctly stated in the MINING AND SCIENTIFIC PRESS, as implied by our cotemporary.

The new Oakland ferry boat now being built at the end of Long Bridge, is nearly ready for launching. She will be 225 feet long, and can carry 2,000 passengers. Can New York do better?

California Pioneer Fuse

MANUFACTURING COMPANY,

MANUFACTURERS OF

HOSE AND TAPE FUSE,

A New and Superior Article for Blasting in very wet ground, or under water.

Great difficulty has heretofore been experienced by miners, and others in the use of Fuse, which has been subjected to deterioration from exposure to dampness during transportation, or during the great length of time which has passed between its manufacture and use. In addition to great painstaking in the manufacture of the California-made Fuse, the above and many similar objections are entirely obviated, and the operator can always depend with certainty upon the burning of his fuse.

It is often the case that extra lengths are required, as exploding tunnels, etc., longer than is furnished in the imported article. Fuse of every desired length or size can be made to special order, at the above manufactory.

Manufactory, - - - Potrero, San Francisco.

OIL STOVES!

MORRILL'S

Petroleum and Universal Oil Stoves

Have proved themselves a superior substitute for Wood and Coal Stoves, in that they work quicker, are neater, bake and broil better, and MORE ECONOMICAL generally. They are portable, can be used in any room, with or without chimney, as they emit no smoke, soot or ashes. There are nine different sizes, designed for barbers, dentists, and other mechanical purposes—as well as for cooking. They are perfectly safe.

I now offer a reward of \$100 for every Petroleum Stove exploded by Naphtha delivered at my store, 18 Geary street, where they are for sale by

M. B. BULLARD,

Proprietor of Petroleum Stove for California, and Agent for Universal Oil Stove for Pacific Coast.

N. B.—Petroleum Stoves burn Naphtha converted into a gas. Universal Oil Stoves burn Naphtha, Benzine, or Coal Oil, with non-illuminating flame and light on a wick as easy as a lamp.

THE LATEST IMPROVEMENT
In Dentistry.

PATENTED DECEMBER 3d, 1887, by DR. G. W. COOL. The right of San Francisco reserved for his own use. The nature of his improvement consists in lining the entire concave surface with fine gold; it makes the plate twice as strong and one-third thinner than the common vulcanite plate. This work has given satisfaction in every case. Please call at No. 14 Third street, near Market, and see specimens. All work warranted as fine as the specimens. Prices reasonable.

Fire, Hose and Machine Belting.

THE SUBSCRIBER CONTINUES TO MANUFACTURE Oak Tanned Leather Fire Hose, warranted superior to Eastern Hose, manufactured at the Sixth Street Tannery, San Francisco.

Pacific Iron Works.

First and Fremont Streets,
 SAN FRANCISCO.

Having been established since 1851, we have accumulated
 a very large variety of Gear and other Machinery, which,
 with our superior tools and appliances, give us facilities for
 doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,
 Horizontal and Vertical, for either Stationary or Marine
 use.

BOILERS—High and Low Pressure,
 Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

Including High and Low Mortars for wet or dry crushing;
 Furnace Irons for Roasting Ores; Fretting Barrels;
 Varney's and Wheeler's Amalgamating Pans
 and Settlers; Stamp Shoes and Dies of
 best White Iron; Russia Iron
 Screens, etc., etc.

Flour Mill, Saw Mill and Sugar Mill Work in every variety;
 Pumping and Hoisting Machinery; Handbrow's
 Patent Challenge Pump, for Domestic,
 Ship and Mining use—the most
 approved and successful
 Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Va-
 riable Cut-off Engine," of which we are the sole manufac-
 turers on the Pacific Coast, under license from the Wood-
 ruff & Beach Co., Hartford, Ct. As a simple, effective, fuel
 saving, first-class Engine, this is, without doubt, the best
 Engine made in the United States.
 Orders promptly attended to. Prices as low as possible
 for first class work, and we intend to do no other.
 San Francisco, May 1, 1868. **GODDARD & CO.** 18v16f

To the Mining Public.

THE SUBSCRIBER HAVING SERVED FOR THE LAST
 twenty years as Superintendent for various Companies,
 working mines of Gold, Copper, and Argentiferous Galena,
 offers his services to examine and report upon mines and
 mineral property. Reports accompanied by Plans, Sections
 and other Drawings. Also would be willing to take
 the management of any legitimate mining enterprise. If
 necessary, satisfactory references given. Address,
 14v16f **H. H. SHELTON, Copperopolis, Cal.**

SUSPENSION BRIDGES.—The suspension
 bridge over the Ohio River at Cincinnati,
 from plans by Mr. J. A. Roebling, has a
 span of 1,057 feet, the largest existing span
 of a suspension bridge. It crosses the
 river, with a clear headway of 100 feet
 above low water; the greatest variation be-
 tween the summer low-level and that of the
 spring freshets, being sixty feet. The mass-
 ive towers of masonry rise 200 feet above
 low water. The supporting members of the
 bridge are two cables of parallel wires of
 No. 9 gauge—each cable being 12½ inches
 in diameter, and containing 5,250 wires;
 the breaking strength of the wire being
 over sixty tons to the square inch of net
 section. Nearly half of the weight of the
 roadway and load, is carried by diagonal
 wires, running straight from the tops of
 the towers to successive points along the
 floor, so that the main cables, stiffened by
 this arrangement, really carry about half of
 the total weight of the roadway and load.
 Length, 2,000 feet; cost \$2,000,000.

The Niagara suspension bridge is of 883
 feet span, and 230 feet above the river.

Amongst tubular iron bridges, those
 erected by Stephenson are among the most
 extraordinary structures of modern times.
 The Britannia bridge, across the Menai
 Strait, built for the Chester and Holyhead
 railroad, consists of four spans, two of 230
 feet each, and two of 468 feet each. It is
 100 feet above high water. The Conway
 bridge, also erected by Stephenson, has a
 single span of 414 feet, and is but eighteen
 feet above the level of high water.

The Kieff suspension bridge—among the
 greatest of all suspension bridges in extent
 —over the Dnieper river in Prussia—Chas.
 Vignoles, engineer—was begun September
 9th, 1848, and finished October 10th, 1853.

Its extreme length is 2,562 feet. Each of
 the principal spans is 440 feet; each of the
 two side openings are 225 feet. There are
 also drawbridges at each end. The clear
 water way is 2,140 feet. The platform of
 the bridge is thirty feet above the summer
 level. The river rises twenty feet. The
 height of piers from foundations, is 222 feet.

The versed sine of chain (not wire cable,
 but a chain of bars) is thirty feet. Each of
 the four chains is 2,280 feet long; their
 weight and that of the piers being 1,578
 tons. The minimum sectional area of the
 four chains is 429 square inches. The total
 weight of the iron in the bridge is 3,500
 tons. Of masonry and concrete, 1,500,000
 cubic feet were used in the construction.
 The total cost of the bridge was \$2,160,000.
Am. Jour. of Mining.

A REMARKABLE GAS WELL.—Mr. F.
 Bowen, writing to the *Scientific American*
 from Burning Springs, West Virginia,
 gives the following description of a won-
 derful well emitting gas at a high pressure.
 He says:

"I will attempt to give you some idea of
 an immense gas vein here, which may be
 interesting to you and your readers. The
 well is 900 feet deep, four-inch bore, with
 a two-inch pipe leading from it more than
 a mile long, supplying 28 boilers of 12
 horse power each, 50 stoves, and many
 lights, beside those which spring from
 leaks along the line, in consequence of the
 great pressure. I am now writing before a
 brilliant light on the counter, an engine of
 one horse power pumping water over the
 house, and the waste gas running two
 stoves. My gas is brought through one-
 half and three-quarters inch pipe, and yet
 I am obliged to cut it off outside to pro-
 duce the proper pressure. I believe the
 pressure is not less than 200 pounds to the
 square inch. The gas is nearly pure hydro-
 gen with some carbon; it soon, however,
 mixes with the atmospheric air and thus
 becomes illuminating."

THE TRUE POLICY.—The Lawrence
American states that a prize of 10,000 francs
 has been awarded to the Pacific mills, at
 Lawrence, by the Paris International Exhi-
 bition for its success in securing a state of
 harmony between the employers and work-
 people, and in promoting the material, in-
 tellectual and moral welfare of the opera-
 tives. "This is one of three awards of
 10,000 francs each, proposed by the Em-
 peror of France, to be given to individuals
 or associations for superiority in the above
 respect." This shows that the French
 Mephistopheles has deeply studied the sub-
 ject of "how to do it."

GERMAN SILVER.—PAK FONG.—The origi-
 nal German silver is made of copper, forty
 parts; nickel thirty-two, zinc twenty-five,
 and iron three parts. Another recipe is:
 nickel and zinc each one part, and copper
 two parts. The Chinese Pakfong is made
 of nickel and zinc each seven parts, and
 copper five parts.—*Jour. Applied Chem.*

IMPROVED SAFETY-LAMP.—An ingenious self-extinguishing safety-lamp has recently been patented by Mr. Louis Dessens, and consists in attaching to the wick-holder a spring, the tendency of which is to draw it downward into the wick-tube. One side of the holder, which is notched, passes through a slot in the tube, and is worked by a screw from below the oil chamber. There is a spring and pins, which permit of the closing of the lamp after it is lighted, but if any attempt be made to screw off the top the spring is brought against one of the pins; and the unscrewing being continued the wick-tube revolves, taking the rack off the screw, and permitting the spring in the wick tube to draw the wick downward and extinguish the light.—*London Mining Journal.*

THE GOLDEN ERA.

Founded in 1851, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its grant and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent.

THE GOLDEN ERA

Is the most universally popular of all the Weekly Journals. It presents forty-eight columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected matter. It is a welcome guest in Cottage and Cabin; the favorite at the fireside in city and country; the most useful, agreeable and altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe and elsewhere. Every household in the mountains and valleys, the cities, towns and mining camps of California, and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor. Inspired with the genius of the age, it is progressive, and aims not so much at distinction as a newspaper, as at honorable success in its capacity of a great Moralizing and Improving Influence, exercising a positive power for good, and wielding a permanent influence, many able and eminent writers choose its columns as a means of communicating with the public. No effort will be spared to make it a thoroughly California newspaper, and worthy of the support of all classes of our citizens.

WATER CURE.—There is no one that so much needs a home with its comforts as the invalid. He needs proper nursing and a diet adapted to his condition in the various stages of disease and convalescence. He needs perhaps more than all to learn the art of preserving his health when once restored. With the view of meeting a want like this, Dr. B. J. Smith, graduate of the N. Y. Hydropathic College,—for the past ten years in charge here of a hydropathic establishment, has recently purchased and fitted up an extensive health institute, to be known as the "San Francisco Hygeian Home Water Cure," at No. 637 California street,—a healthy, quiet, central location,—where all the necessary buildings, baths and apparatus for such an undertaking have been provided, regardless of cost. So far as we know, there is nothing of the kind here so complete in itself, or on so grand a scale as this. None, we believe, has such a great variety of baths, or equal accommodations, particularly for the treatment of diseases peculiar to females.

The bath-rooms for the cold, warm, vapor, shower, and sitz bath, as also that of the electro-chemical and combined Russian and Turkish, is each a model in its way; while the well-ventilated apartments, opening as most of them do, to the sunlight, and overlooking city and bay, give to the whole an air of comfort and cheerfulness, such as rarely falls to the lot of the invalid.

EMBALMING.—A subject treated by the patented carbolic acid process of Prof. Seely, 103 days previously, was recently examined at the Bellevue Hospital by a number of scientific gentlemen, and found in perfect preservation. There was no smell, and the face was startling in its naturalness. The Professor was himself astonished to find that the success of the process was so complete. Decomposition had been absolutely prevented. In this case a simple solution of the acid was applied externally, and injected into the natural openings of the cavities of the body. It is, however, proposed, when there are no objections to making incisions, to inject it also into the veins. It is believed that thus prepared, the bodies will last a hundred years.

THE PROPHEET IN A NEW ROLE.—Brigham Young has taken the contract for the grading on the Union Pacific Railroad, from Echo Cañon to Salt Lake. Work is to be commenced at once.

THE BEST IN AMERICA.

The Mining and Scientific Press,

is the Largest and Best MINING AND MECHANICAL Newspaper issued in the United States.

DEWEY & CO.,

Patent Agents, Publishers, Book and Job Printers, 505 Clay Street, San Francisco.

THE MINING AND SCIENTIFIC PRESS is published every Saturday. Each issue comprises sixteen pages (64 columns), and furnishes more valuable reading matter than any other weekly journal in California.

To the practical mechanic, metallurgist, prospector, millman, mine holder or worker, it is worth many times its subscription price. Its files contain a record of the improvements in mining machinery, the progress and development of the mines, and all new methods and processes for working and.

SAVING PRECIOUS METALS.

All progressive information, in fact, transpiring with the times—which cannot be obtained from books.

The Mining and Scientific Press is now in its Sixteenth Volume, and enjoys a large circulation. It received the following hearty endorsement of the California Mining State Convention, held at Sacramento, January 17th, 1886:

RESOLVED, That we regard a mining paper or journal of great importance to the mining interests of California, and recommend the MINING AND SCIENTIFIC PRESS, of San Francisco, to the consideration and support of the miners of the Pacific coast.

Terms of Subscription.—One year, \$5; six months, \$3—in advance. Send for sample copies. Remittances may be made by mail at our risk, if parties sending will register their letters, or send money order.

As an advertising medium throughout the whole Pacific States and Territories, the Press is unsurpassed. Rates moderate.

AN INSTRUCTIVE BOOK!

Prof. LAYRES'

ELEMENTS OF COMPOSITION.

BELLES-LETTRES AND ORATORY

For Scholars, Teachers, Lawyers all Professional Persons, and those of Common Education, who would improve the Eloquence and Effectiveness of their Composition and Manners of Address.

Price, postage paid, - - - - \$1.10

This is a new publication, and in style and treatment of this important subject, is original, simple, plain and comprehensive. The author, Prof. LAYRES (a meritorious Teacher of good standing in California, and a sound thinker and reasoner,) in his preface says: "The method pursued by the Author in developing the subject of Composition, is both the synthetical and analytical. The former is necessary to teach the theory, the latter the practice of the art; and as these are both indispensable to the scholar, so are also the two methods, as the sequel will show."

The Work has lately been approved and authorized by the State Board of Education for use in the Public Schools. To further illustrate the varied and popular endorsement the book has so rapidly received, we quote the following

RECOMMENDATIONS:

It is simple, concise, and well arranged. It seems to be a work of great value.—John Scott.

I am prepared to concur in the recommendation of the Honorable Superintendent of Public Instruction.—J. C. Pelton.

After a careful and thorough perusal of the same as it was in my power to give, I come to the conclusion that, for conciseness, correctness, and precision of definition, as well as for completeness and simplicity of style, it was, and would be, without a rival. I regard your work as the best of its kind. I know of but few men in any profession who would not be benefited by its careful study.—Wm. H. Hill.

I regard it as one of the best treatises upon these important branches—perhaps the only one obtainable—and of equal advantages—combining comprehensiveness with conciseness, and of such simplicity in its arrangement as to be readily understood by the advanced pupil.—F. W. Hatch.

It is admirably arranged to develop the correct idea of the analysis and synthesis of language, and the amplification of ideas into sentences and periods. The style is clear, terse and pleasing. I do not hesitate to recommend it as a great acquisition to our text books.—James Dorman.

I am happy to express my conviction of the value of the whole treatise. It would give me much gratification to see so thorough and excellent a treatise emanate from young California.—Martin Kellogg.

I recommend it to all those who wish to obtain a book which will give them definite ideas on this subject, and teach them to express their thoughts and feelings in a clear, simple, and forcible manner.—Caroline L. Atwood.

I regard the book about to be published as far superior to any work extant upon that subject.—Wm. S. Hunt, A. M.

I believe the work will be a valuable and much needed addition to our school text-books.—Herman Perry.

You have brought the results of a profound analysis, and made them available, in a practical form.—I. H. Brayton.

I can recommend it particularly to my young friends of the legal profession, as a source from which they may be able to learn much of value as special pleaders and as advocates at the forum.—John Curry.

The subjects upon which you treat have heretofore been too much neglected in the education of young men in America. * * * Exactly calculated to interest. * * * It will soon become a necessity in every lawyer's library.—Charles A. Tuttle.

Its clearness and comprehensiveness make it easy.—G. W. Boile.

A gentleman of varied learning and ripe culture, who has half a dozen languages at his tongue's end. He seeks to teach the student not only how to take sentences apart, but how to construct them. His system has the merit of originality. We know of no work in which can be obtained so lucid an exposition of the elements of composition, and such valuable assistance in learning how to put his ideas into language. Prof. Layres has done the course of popular education good service.—S. F. Bulletin.

This is a San Francisco book by a San Francisco author. It contains 166 pages, and is altogether creditable to San Francisco. It meets a public want, and meets it in a form and style cheap and convenient, and in reach of the humblest.—The California.

The writer, the lawyer, the minister, or the statesman, may study his rules and definitions with profit. Nothing conduces more to the purity of a national literary taste than a general and thorough knowledge of the rules by which the construction of language is governed.—S. F. Times

Prof. Layres plunges at once "in media res." He seizes a sentence (which is the unit in composition, whether written or spoken) holds it up before you; tears it to pieces before your eyes—or rather, we should say, neatly and skillfully dissects it—displays one by one its several parts; makes you thoroughly acquainted with each, in its entirety; and then shows you how to put them together again. A series of such experiments, increasing in complexity as gradually as you do not feel the difficulty, and the thing is done; you are master of the subject.—Mining and Scientific Press.

Its design is to show that ideas can be so arranged as to increase their power; in short, to teach the mechanics of composition, eloquence and oratory. A desideratum long felt is supplied.—S. F. Examiner.

This is an age in which the occasions are rapidly multiplying, when educated men and women, too, are called upon to express their views in writing, either for public or private inspection and criticism.—Boston Independent.

The most eminent educators in California give it their hearty approval, and we concur.—Maryville Appeal.

Not only one of the best of its kind, but what is still better, one of the briefest. It contains 166 pages.—Virginia Enterprise.

Price, \$1.10. Sent by mail, postage paid, without extra charge. Liberal reductions made to the Trade, Teachers and Schools, ordering by wholesale. Orders received by our Traveling Agents.

Address DEWEY & CO., Mining and Scientific Press, San Francisco.

VITRIFIED CAOUTCHOUC.—This is a new material for photographers' use, invented by M. Marion. It is a transparent film of india rubber, less fragile than glass, and less opaque than paper. Its use is to receive the film of collodion bearing the photographic image. A glass negative is obtained in the usual manner, and upon the sensitized side of the plate the caoutchouc film is applied by means of a special kind of varnish. When it has become dried, the whole is plunged into a vessel of water, and in a few minutes the collodion with the image leaves the glass, adhering to the new medium; which latter may be now packed away until it is required to be used to print from.

LARGEST ORGAN.—The largest organ in the world is said to be in the little city of Fryburg, in Switzerland. When in full play, it pours forth a tempest of sounds through a forest of pipes, seven thousand eight hundred in number, shaking the walls and the foundations of the old church in which it stands.

SAVE YOUR TEETH.—Drs. Jessup & Beers, over Tucker's jewelry store, are now making a specialty of filling the fangs of dead teeth, and building up broken crowns with pure gold—thus restoring them to their original usefulness and beauty. They are also using Nitrous Oxide for the painless extraction of teeth, when so desired—the only absolutely safe anesthetic ever discovered. In breathing it, it feels as a gentle stimulant, without undue excitement, the sensation produced being truly delightful, the effect upon the lungs healthful, and in its results positively free from danger. Prepared and administered daily at the Dental Rooms of Messrs. JESSUP & BEERS, corner Montgomery and Sutter streets, San Francisco. 16-161f

M., for the election of Trustees and the transaction of such other business as may be presented.

T. W. COLBURN, Secretary.
Office, room No. 10 second floor of No. 402 Montgomery street, San Francisco. my9

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merit.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the miller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the
PACIFIC FOUNDRY,
1st St. San Francisco.

SUPERIOR CUT-OFF ENGINES.

We desire to call the attention of Engineers, Manufacturers, and Millmen, to the celebrated

Hartford Engine,

With Wright's Patent Variable Cut-off, which we are now manufacturing under a license from the Woodruff & Beach Iron Works Co., Hartford, Ct. To parties wishing a first-class

Fuel-Saving Engine,

Simple and durable in construction, this Engine is offered in the belief that it is superior to any other manufactured. It enjoys the very highest reputation in the Atlantic States, where it is well known; over 300 of them having been built by the Woodruff & Beach Company, and being now in successful operation.

GODDARD & CO.,

Pacific Iron Works.

Corner First and Mission streets, or Box 2,077
3rd St. SAN FRANCISCO.

NOTICE TO MERCHANTS

AND

MANUFACTURERS.

Moore's Patent Friction Hoist.

Now in successful operation in the principal stores in San Francisco, possesses many advantages over the common Hoist—greater strength; less danger in working, as goods require no slinding or landing; consequently make fewer breakages; requires one man less to operate it; stops with the load at any point, without any fastening or attention from the operator.

The undersigned take this opportunity to notify all whom it may concern that they have secured, by letters patent, the application of a friction hoist, and to hoisting machines, and that they will prosecute any party making or using any machine infringing upon the same.

No. 525 Mission street, near Second.

T. STEBINS,

Pattern and Model Maker,

Has recently opened a shop at No. 28 Fremont street, over Clerc & Co's Foundry, where he is prepared to execute with neatness and dispatch, all kinds of models in wood, brass or iron, and patterns of every description. Jig-Saws of any size or strength, of a new and superior quality, built to order. Also an ingenious machine for Polishing Shirts, well adapted for Laundries.

Terms reasonable for all classes of work, and regulated by the style required.

Fire-Brick and Fire-Tile.

THE UNDERSIGNED KEYS ON HAND A GENERAL assortment of Fire-Brick, Fire-Clay, Brick-Bust, and Tiles of different sizes. LIME, PLASTER AND CEMENT. Corner of Market and First streets, San Francisco. Branch Store, Sixth street, Sacramento. Millmen and Gas Companies supplied at short notice.

7th St.

H. T. HOLMES.

Brodie's Patented Improvements

FOR THE TREATMENT OF

Gold and Silver Ores.

BRODIE'S PATENT IMPROVED QUARTZ CRUSHER.
The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:

No. 1—Or 10 inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price, \$600
No. 2—Or 15 inch Crusher, capable of similarly putting through five to six tons per hour, 850
No. 3—Or 18 inch Crusher, will in a similar manner crush from seven to eight tons per hour, 1,200

The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the opening, F, which can be regulated at pleasure, so as to graduate the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, L, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size. The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tulumene county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco. The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tulumene County: RAWHIDE RANCH, Tulumene Co., Sept. 28, 1866. JAMES BRONIE, Esq., San Francisco—My Dear Sir: I give you pleasure to inform you that I have for the past three months had one of your largest sized Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which is entirely met my expectations; and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly, R. P. JOHNSON, Supt. Rawhide Ranch Quartz Mill.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers. For the present it is not intended to grant licenses for the use of the improved German Barrel, for a longer term than twelve months. All persons desiring to compromise, without having recourse to legal proceedings, for past infringements, or desirous of receiving Letters of License for the limited period named, are requested to address as below. A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866. JAMES BRODIE, Fulton Foundry, or CHARLES RAILLON, Express Building, 402 Montgomery street, San Francisco.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers. A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866. JAMES BRODIE, Fulton Foundry, or CHARLES RAILLON, Express Building, 402 Montgomery street, San Francisco.

**A SAFE,
CERTAIN,
AND
Speedy Cure
FOR
NEURALGIA,
AND ALL
NERVOUS
DISEASES.**
Its Effects are
Magical.

It is an UNFAILING REMEDY in all cases of Neuralgia Facialis, often effecting a perfect cure in less than twenty-four hours, from the use of no more than two or three pills. No other form of Neuralgia or Nervous Disease has failed to yield to this

WONDERFUL REMEDIAL AGENT.

Even in the severest cases of Chronic Neuralgia and general nervous derangements,—of many years standing,—affecting the entire system, its use for a few days, or a few weeks at the utmost, always affords the most astonishing relief, and very rarely fails to produce a complete and permanent cure.

It contains no drugs or other materials in the slightest degree injurious, even to the most delicate system, and can always be used with

PERFECT SAFETY.

It has long been in constant use by many of our most

EMINENT PHYSICIANS,

who give it their unanimous and unqualified approval. Sent by mail on receipt of price, and postage.

	Price.	Postage.
One package.....	\$1 00	6 cents.

Legitimate Photography

OUR SPECIALTY.

THE FIRST PREMIUM AWARDED AT the late State Fair for the best plain Photographs, and a special premium for the best Cabinet Portraits, to SILAS SELLECK, 415 Montgomery street. Prices reduced to conform to Association rules. Patent secured.

25th St.

Eley's Ammunition.

These Cartridges are made in three sizes, viz., .37 (or Snider Enfield) bore; .50 (or half-inch) bore; and .45 (or small) bore.

These Cartridges have been adopted, after careful comparative trials against all other descriptions, by HER MAJESTY'S WAR DEPARTMENT, as the standard Rifle Ammunition for the BRITISH ARMY, and are not only used exclusively for the Snider Rifle, but are adapted to all other systems of military RIFLE LOADING RIFLES. They are the cheapest Cartridges known, carrying their own ignition, being made wholly of metal, are water-proof and impervious in any climate.

Boxer Cartridge Cases (empty), of all 3 sizes, packed with or without bullets, and machine for filling same in Cartridges.

Makers of BOXER CARTRIDGES. .450 bore for Revolving Pistols, in use in Her Majesty's Navy.

PIN CARTRIDGES for Lefauchaux Revolvers of 12 m, 9 m, and 7 m, bore.

CENTRAL FIRE and PIN FIRE CARTRIDGES, for all sizes of guns, Rifles and Revolvers.

Double Water-Proof and E. B. Caps. Wire Cartridges for killing game at long distances. Felt Waddings to improve the shooting of guns; and every description of Sporting and Military Ammunition.

Wholesale only. **ELEY BROTHERS,**

18th St.

National Mineral Land Law, Instructions.

Blanks, Etc.

Copies of the Act of Congress, approved July 26th, 1866, relating to the Location of Mineral Lands, together with the instructions to the "United States Registers and Receivers and Surveyors General," from the Commissioner of the General Land Office Department of the Interior, dated at Washington, Jan. 14th, 1867, can be had at this office. Also a full set of blanks for making applications, advertising, etc. Address DEWEY & Co., office Mining and Scientific Press, San Francisco.

WHAT THEY THINK OF IT.—The *American Journal of Mining* for April 18th, has an editorial upon the Geological Survey of California, which shows us what we are to expect from the scientific world generally. We quote:

"The telegraph has recently brought us news of a calamity that will be regretted by all interested in the progress of science and the prosperity of our Pacific States. The Legislature of California, with a shortsighted economy that appears to us perfectly incomprehensible, has abolished the Geological Survey of that State, at a point in its career when it was just about giving to the world the most important of its results. A small but laborious corps has been for upwards of seven years, under the leadership of a man whose position is deservedly at the head of his profession in the United States, contending against all the disadvantages and hardships incident to frontier travel, in a country where settlements are scattered, roads few, among mountains exposed for weeks at a time to the snow and rain.

Inspired by the energy and indomitable pluck of their chief, they have persevered, in the belief that they would be amply rewarded by the eventual publication of the results of their labors in a manner alike creditable to themselves and to the State that had inaugurated so noble an undertaking. There was not a man in the commission, from its chief to his most subordinate assistant, but could at any time have commanded a much larger salary outside the Survey than in it. Their continuance in the work was therefore a direct pecuniary sacrifice; and the action of the Legislature in not providing for the publication of the reports must be looked on as little short of an indirect breach of faith on the part of the State. * * * Had the plans of the Survey been carried out as ordered by the Legislature that inaugurated it—"an accurate and complete geological survey of this State, with proper maps and diagrams thereof, together with a full and scientific description of its rocks, fossils, soils and minerals, and of its botanical and geological productions"—the reports and maps would have comprised a library of scientific and economic information, equaling in value the deservedly admired reports of the New York commission. Besides the persons directly connected with the work in California, many of the most eminent scientific men of the country had been engaged for several years as co-laborers in their specialties. * * * We sincerely trust that some provision has been made for the publication of the reports now ready. The information to be obtained from a meager telegraphic message is, at best, unsatisfactory; and we can only hope for the best, while we fear for the worst. Professor Whitney, we understand, expects to sail for the East this month, and will doubtless very soon assume his new duties at Cambridge, where a professorship has been waiting for him for several years."

PROFITS OF THE PARIS EXPOSITION.—The figures of the Paris Exposition foot up brilliantly. Three millions of francs, or about \$600,000, are the profits on the enterprise. Eleven millions of persons passed the turnstiles, to say nothing of the season subscribers, exhibitors, jurors, and other "deadheads." There is now an embarrassment as to what shall be done with the money—an extraordinary question (one would think) for France, where everything is regulated beforehand. The Imperial Government subscribed one-third of the money necessary for the enterprise, and the municipality of Paris one-third; but there was no thought of realizing a profit. They hoped only to cover expenses, and all the economy of the Commission (some people call it meanness) looked only to this end. Each of the parties now refuses to accept its million, and the probability is that, after paying them the interest on the money and the cost of a hundred lawsuits that are going to follow, some useful destination will be found for the money. The sum gained on the three "supplementary days" for the poor of Paris was 176,000 francs.—*American Artisan*.

AQUARIUMS.—Aquariums are now essential in the room-gardening of all persons of taste. Growing plants, fishes and water reptiles are placed in the same globe or tank of water, and the gases which the fish reject are the food of the plants; while the plants, on the other hand, prepare the elements necessary for the health of the fish. By this beautiful principle of reciprocity, both plants and animals remain in perfect health, without the water scarcely ever being changed.—*Gardener's Monthly*.

HEAVY BLASTING.—A blast, estimated to have brought down 25,000 cubic yards, or about 50,000 tons of limestone, was lately fired in Mr. Savia's quarry at Llanymynech. Preparations for the blast were made as long ago as September last. A level 12 yards in length was driven into the vertical face of the rock at a height of a few yards above the floor of the quarry. At the end of this level a cross level was driven right and left, and at each end a vertical shaft was sunk, besides a third at an intermediate point, these shafts reaching down to the level of the floor of the quarry. Chambers were forced at the bottom of the shafts, and 6,000 lbs., 4,000 lbs., and 3,000 lbs., respectively, of powder were placed in them, or nearly six tons in all. This large quantity of powder was not so great as has been used in single blasts at Holyhead, where as much as 11 tons has been fired. The blast was successfully fired by electricity, the wires being connected with a Grove's battery of 28 cells. The limestone brought down will be carried into Shropshire and South Staffordshire to be used as flux in the blast furnaces of those districts.—*London Engineering.*

MUSIC BY TELEGRAPH.—A London musical paper says that by the adaptation of Baker's system of electricity to organs, it is possible for a performer in England to play on an instrument situated in America. To have the great organ in the Boston Music Hall, or that in Mr. Beecher's church, played by the agency of the Atlantic cable would now-a-days be regarded as no more wonderful than the laying of the cable itself. This was considered an impossibility only a few years ago.

With the aid of this Book, the miner can assay his own ores, requiring but few materials, etc., except such as are generally to be found in the interior towns. 21v15tf

ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

Patented Nov. 1st, 1864; July 21, 1866; and Oct. 9, 1866.

Awarded the First Premium at the Paris Exposition.

ADAPTED

FOR
Smelting,

Foundry,

Mining

and

Steamships.

REQUIRES

Fifty Per Cent.

LESS POWER

Than any Blower

now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver mine; Gridley's Foundry, Gold Hill, Nevada; Etna Iron Works, San Francisco, and many other places.

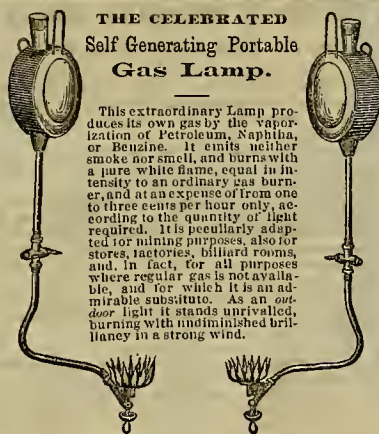

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

For Circulars and further information, address

KEEP, BLAKE & CO.,

Globe Iron Works, Stockton, Cal.

THE CELEBRATED
Self Generating Portable
Gas Lamp.

This extraordinary Lamp produces its own gas by the vaporization of Petroleum, Naphtha, or Benzine. It emits neither smoke nor smell, and burns with a pure white flame, equal in intensity to an ordinary gas burner, and at an expense of from one to three cents per hour only, according to the quantity of light required. It is peculiarly adapted for mining purposes, also for stores, factories, billiard rooms, and, in fact, for all purposes where regular gas is not available, and for which it is an admirable substitute. As an outdoor light it stands unrivalled, burning with undiminished brilliancy in a strong wind.

Directions for Use.

Charge the reservoir with the prepared fluid, or with Benzine, from half to three-fourths full; allow a portion to run through into the cup, then turn off the tap and ignite the fluid, which will heat the burner sufficiently to generate the gas, which will be seen issuing from the top. The tap must now be turned on, and a steady light will be maintained till the whole of the contents of the reservoir is consumed.

A small needle, bent at the point and fixed in a holder, may be occasionally required to clear the minute hole through which the gas issues, and the regulating screw at the bottom turned a little back; but care must be taken not to force the screw too high, and it should never be used to extinguish the light—by turning the top off, it will gradually go out.

When necessary to renew the cotton which is placed in the lower pipe to prevent the too rapid flow of the fluid, the lamp should be placed in a vise and the burner screwed off. The burnt cotton must then be withdrawn, and a fresh piece of stout cotton rag, one inch wide and four or five inches long, should be doubled over a piece of wire, and inserted into the pipe—the ends cut short off, the burner again screwed on with a little white lead, and the lamp is ready for use.

Manufactured solely by JOHN J. HUCKS, original proprietor, Factory, North Beach, San Francisco; and for sale by his agents in every city and town throughout the State. 18v163m-5

The American Spring Bed.

THIS BED, NOW SO POPULAR IN THE EASTERN and Western States, was patented August 1853. For practical utility, comfort and durability, it is unsurpassed. It is easily applied to any bedstead. It is portable, and not liable to rot or order. The price is about one-fourth that of the spring mattress. It combines cleanliness with cheapness and comfort. Call and see it. Mechanics' Institute Building, No. 29 Post street, San Francisco. 8v163m

SPONGE FOR BEDS INSTEAD OF HAIR OR FEATHERS.—Scientific research has been long and actively engaged in devising some other substitute for feathers in beds, than curled hair. Various substances have been tried, such as pulu, shavings peculiarly prepared, California soap root, etc. Quite recently an entirely new textile has been introduced, which promises important practical results. This new textile is known as "grass sponge," which grows in great profusion along the coast of Florida, and in many other parts of the Gulf of Mexico. This is not the ordinary sponge of commerce, and has no known commercial value, except for this purpose. It grows in shallow water, and hence is easily and cheaply collected. After proper preparation a quantity of this sponge, which may be closely compressed into one cubic inch of space, and held there for months, will, on being liberated, expand to twelve times its compressed bulk. This peculiarity gives it an especial value for upholstery, mattresses, etc. It never packs, and is always free from every description of insect life.

A company, known as the Pacific Elastic Sponge Company of California, has been organized in this city, which has secured the exclusive agency for its sale on this coast for the purposes specified. The agent, Mr. William R. Strong, states in his general circular, that a hair mattress of a grade which will sell for \$50, can be furnished, stuffed with sponge and possessing equal elasticity and bulk, but less weight, for \$30. See company's advertisement in another column.

THE LABOR EXCHANGE.—The engagements at the Labor Exchange for the five days ending Thursday night last, were 335, distributed as follows: Laborers, 121; teamsters, 21; lumbermen, 25; painters, 11; carpenters, 23; farm hands, 45; coopers, 4; cooks, 7; blacksmiths, 6; shoemakers, 3; wagon makers, 4; miners, 3; other trades, 68. There has been quite a demand, during the week, for farm hands and lumbermen. The large number of workmen sent into the interior, through the assistance of the Labor Exchange, has materially reduced the number of unemployed persons in the city; so much so that it is now found difficult to answer orders for several kinds of labor. These results speak most unmistakably of the benefits resulting from this institution. It has made a practical demonstration to the world, of what has all along been claimed, that there is an abundant demand for labor in California, which the unemployed can find by looking for it.

As if by magic comes repose.
Forget thy pain, forget thy woes.

This harmless Remedy stops all pain instantly, and leaves no stain. The tongue cannot mention any physical pain that this Pain will not remove in five minutes. Whether a frightful burn, a gripping Colic, or a simple Mosquito bite, the result proves an entire relief from distress at any spot or place where applied, or the money will be invariably returned to any purchaser.

MOORE'S PAIN PAINT AND PAIN ANNIHILATOR is sold by the druggists.

Pain Annihilator, a Standard Remedy for Catarrh, 25 cts., 50 cts., and pint \$1.

Pain Paint at 25 cts., 50 cts. and \$1. Half pints, 50 cts.; pints, \$1; quarts, \$2; gallons, \$4. Ointment can be had at the General Depot only, where all pain is instantly relieved, free of charge.

G. H. MOORE, Inventor and Sole Proprietor, 652 Market Street, San Francisco, Cal. 21v16-3m

DISEASES OF THE EYE.—During a late visit to San Francisco, we fell in with an old acquaintance from this county, Mr. G. W. Purdy, who formerly resided at Forrest City. About two years ago, while under treatment myself, we saw Mr. Purdy at the office of an oculist in that city, with eyes badly inflamed and the sight entirely lost. We saw him a few months later at another physician's, but his case was scarcely improved, and seemingly hopeless. His eyes have now entirely recovered, so that he goes about his ordinary business. From his own lips we learned that the restoration of his sight was entirely due to Dr. D. R. Morgan, whose office is at No. 627 Sacramento street, between Montgomery and Kearny, who cured him in the short space of eighteen weeks. Mr. Purdy mentioned several remarkable cures which occurred in the practice of Dr. Morgan during the time he was under treatment, among which was that of Mrs. Jane Albert, of Marysville, Yuba County, and several others. Mrs. Albert had been afflicted with sore eyes from early childhood, and for eleven months previous to treatment she had not been able to discern light, nor had she seen the features of her youngest child, twelve months old. She had heard of the remarkable cure of Leonard P. Eder, of Marysville, and Joseph E. Haskell, of Sacramento, and determined to try Dr. Morgan. The result was that she was able, after ten days, to read ordinary newspaper print. Mr. Purdy was of course greatly rejoiced at the recovery of his sight, after so many trials and failures with different physicians.

The above is clipped from the *Mountain Messenger*, of February, 1893.

ENLARGEMENT OF THE

American Journal of Mining

Volume III, Commencing March 3.

In consequence of the remarkable success that has attended this Journal, the proprietors feel warranted in increasing its size to

Twenty Pages.

Thus making it the LARGEST and most COMPREHENSIVE Mining Journal on this continent, representing the Gold, Silver, Copper, Iron, Lead, Coal, Slate, Oil, and in fact all the Mineral interests of America, containing beautiful engravings, illustrating the latest improvements in mining, milling and metallurgical machinery.

The Journal has won the encomiums of the press of the entire country and Europe, and numbers among its contributors more eminent scientific men than any other weekly publication in America.

The reports of the markets in stocks, metals, minerals and ores, carefully corrected weekly, are an important feature of the Journal.

Subscriptions: \$4 per year; for six months, \$2.25—in advance; single copies, 10 cents. Specimen copies sent free.

SIXTH INDUSTRIAL EXHIBITION

— OF —

The Mechanics' Institute.

THE BOARD OF DIRECTORS OF THE MECHANICS' Institute hereby give notice that the Sixth Industrial Exhibition of that Association will be held some time in August next, in a building to be erected for the purpose, in Union Square, in this city. Every preparation will be made to accommodate exhibitors and visitors, with a view to make the Exhibition profitable, instructive and pleasant to all parties.

During the three years which have intervened since the holding of the last Exhibition in this city, the manufacturing, mechanical, scientific and useful, and ornamental arts have made unprecedented progress on this coast, and it is believed that the proposed Exhibition will exceed any other in value that has ever been held on the shores of the Pacific.

The plan of building to be erected, which has been adopted by the Board of Directors, it is believed will prove to be the best adapted both for display and convenience of the public, of any building ever erected in the State. The building will be perfectly water-tight, being covered with a single roof, so that no damage from the elements can be anticipated.

All parties who are interested in any of the branches of Manufactures, Mechanics or the Arts and Sciences, are invited to exhibit in the proposed Exhibition, and to share in the publicity and consequent profit which always attends such enterprises. Suitable premiums will be offered, and the specific date of opening the Exhibition will be published at some future time.

By order of the Board of Directors,
19v16-6t HORACE D. DUNN, Cor. Sec'y.

Mineral Land Law Blanks FOR SALE.

We are prepared to furnish any of the following blanks used in securing patents for lands under the National Mineral Land Act of 1866:

- I. Applicants' Declaratory Statement.
- II. Diagram, Description of Diagram and Boundaries, and Notice.
- III. Register's Order for Publication—with Notice.

IV. Deposition that Notice has been Posted.

V. Application for Survey Etc.

Prices.—Single blanks, 10 cents; 75 cts per dozen; \$4 per hundred—postage paid.

Pamphlet containing the Law and the Instructions of the General Land Commissioner, post paid, 25 cts. Address **DEWEY & CO.,** Mining and Scientific Press, San Francisco.

Changing the Address.—No charge is made for changing the address of this paper. To give all necessary information, write us plainly as follows: "Change address of the Mining and Scientific Press from Mr. ... at ... P. O. ... County, ... State, to Mr. ... at ... P. O. ... County, ... State, ... 186-"

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY and MINERALOGY. 2—CIVIL ENGINEERING. 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING and METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY and GEOLOGY. and 7—SCIENCE COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, \$125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are various and expensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p

The Best Book for Agents Yet Published!

Above 500 copies sold, in San Francisco, in advance of publication.

THE NATURAL WEALTH

OF CALIFORNIA,
BY TITUS FEY CRONISE.

Assisted by a corps of writers selected with especial reference to their knowledge of, and ability to treat the several departments comprised in the volume. Complete in one large Imperial Octavo Volume of over 700 pages; printed on fine paper from new type, and substantially bound in heavy beveled covers.

This elegant Work is a Cyclopaedia of valuable information, embracing every important and interesting fact relating to the material resources and advantages of the Golden State, such as its History, Biography, Scenery, Geology, Natural History, Climate, Agriculture, Mining, Manufactures, Wealth, Products, etc. No intelligent Californian can afford to be without it. Sold only by subscription. Price, \$5.50. Published by

H. H. BANCROFT & CO.,

San Francisco, Cal.

A number of other first rate Works now ready for can vassers. Send for circulars and state territory desired. 2v16-2t

Economy in Advertising.—The MINING and SCIENTIFIC PRESS is the best and most economical mining advertising medium in this city. Our terms are less than one half the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The Press contains, proportionally larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

ELECTROTYPED CUTS, ENGRAVINGS, ETC.—Our Job Printing Office is abundantly supplied with elegant engravings, ornaments, and other embellishments to suit the various branches of industry in this State.

AND SCIENTIFIC PRESS.

Single Copies, Fifteen Cents.

Terms: One Year, \$5; Six Months, \$3.

A Journal of Useful Arts, Science, and Mining and Mechanical Progress.

DEWEY & CO., PUBLISHERS,
And Patent Solicitors.

SAN FRANCISCO, SATURDAY, MAY 30, 1868.

VOLUME XVI.
Number 22.

TABLE OF CONTENTS.

Buerk's Watchman's Time Detector—Illustrated.
The "New Flux" for Gold.
Interesting California Inventions.
Cocoon Fiber for Upholstery.
Artisan's Exhibition and Sale.
First Street Improvements.
Singular Fact.
Zinc and Electric Desilverization.
Mining the Best Investment.
The Microscope in Geology.
Size of Brain in Different Races.
Amalgamation Compared with Smelting.
Production of a Fragrant Oil from Eosin.
Making White Lead.
Aerolites.
The Mechanic Arts in California.
To Dissolve India Rubber.
Quicksilver in San Mateo County.
Improvement in Gas Illumination.
"Dead-oil" as Fuel.
Protection to the Eyes of Workmen.
A New Explosive Compound.

MECHANICAL MISCELLANY.—
The Smoke Question; Lead Floating on Iron; Safety Rails; Hard Steel; Self-Lighting Gas Burner; Feeding Steam Boilers; Diamonds for Glass Cutting; Steel Hopes.
SCIENTIFIC MISCELLANY.—
Chemical Geology; Pangeomys; Plants and Animals; Dissociation; Crystallization; Blow-Pipe Reactions; Spectroscope.
MINING SUMMARY.—Comprising late intelligence from the various counties and districts in California, Arizona, Colorado, Idaho, Dakota, Nevada, New Mexico, Montana and Oregon.
The Suez Canal.
San Francisco Weekly Stock Circular.
Notices to Correspondents.
New Incorporations—List of Officers.
Stock Prices—Bid and Asked.
San Francisco Market Rates.
San Francisco Mining Shareholders' Directory.
San Francisco Metal Market.
New Patents and Inventions.

The Mechanics' Institute Fair.

The Directors of the Mechanics' Institute are busily engaged in making preparations for the forthcoming Fair. The arrangements of the building will altogether surpass any previous one as to space, light, and convenience for both exhibitors and visitors. It has been a general remark heretofore, with regard to these exhibitions, that imported merchandise and manufactures have overshadowed the productions of our own people. It is intended that no such imputation shall apply to the forthcoming exhibition. The most active exertions are being made to secure a full and extensive display of the manufactures of the Pacific Coast. Every consideration of pride and interest should be urged to secure success in the enterprise.

Work upon the Pavilion has already commenced, and the proposed structure will soon begin to assume form and shape. The superintendence of its construction has been placed in the hands of a competent mechanic, who will hire and direct the labor, under the general control of the Board of Directors. The building will be put up under the eight hour rule of labor. We are pleased to learn that the committee having the matter in charge, are meeting with most gratifying success in their canvass for exhibitors. Every possible facility will be extended, and abundant opportunity will be provided for the exhibitors of steam motors to display, to the best advantage, the merits and working capacities of their respective engines. The same facilities will be provided for exhibitions of machinery of every description.

It is hoped that manufacturers and others from the interior, will not neglect the opportunity which will be presented to exhibit the progress, extent and multiplicity of their various industrial interests. It is also expected that inventors will make a favorable show of progress. There has been a most unusual activity in this line during the past two years, and an exhibition of all the important inventions which have been made on the Pacific Coast in that time cannot fail to interest beholders, and must reflect the highest credit on the inventive genius of this western verge of civilization. Efforts are being made to make important specialties of the wine and silk growing interests of the State. Every citizen of San Francisco, in particular, should take especial pride in contributing everything in his power to secure the greatest possible success to this sixth grand industrial exhibition on the Pacific Coast.

Buerk's Watchman's Time Detector.

All large corporations or manufacturing concerns employ watchman, who look to the safety of the several buildings, and are expected to be vigilant in guarding the interests committed to their charge. Property of immense value is thus at the mercy, so to speak, of one man; for if he is neglectful of his duty, he is not only dishonest, but jeopardizes the daily bread of numberless persons who may have funds invested in the concern.

To hire one watchman to look after the other would not be a very wise proceeding, for by collusion they might set at naught all such precautions. Recourse is therefore had to machinery,—silent, insensate wheels and springs. By the judicious combination of these, tales can be told, which

By that act, a small hole is made in the paper, which tells what time the man appeared at each station; how often he came there; how long he stopped; how long it took him to go from one to another; whether he went in regular order or not; in short, it gives a complete record of his night's work.

The small figures are views of different keys. A flange on the side of the key prevents it being turned unless it is inserted quite into its place; so that the key used for one station cannot be used to make a mark for a key at another, nor indeed, can any key except a perfect duplicate be made to do it. Any attempt on the part of the watchman to evade his duty by counterfeiting keys, may be effectually baffled by occasionally changing keys from one station to another. An indefinite number of stations can be served.

has to be followed; but with this a watchman can be ordered to visit any particular place as often as required, without being compelled to go to places where it is not necessary to visit as often.

The instrument is complete in itself, portable, and as reliable as the best lever watch. It is not so likely to become disarranged in its works as a good watch, because its parts are stronger. But when it needs cleaning, any common watchmaker can adjust it, its mechanism being simple. It requires no fixtures or wires communicating from room to room, as in the case with the ordinary watch-clocks; a small, inexpensive stationary key is alone required at each station. Its use is not restricted to a single building, and places can be guarded that it would be impossible to guard with any other instrument, such as railroad tunnels, bridges, yards, shops, etc.

As it is very essential to carry the clock secure, taking care that it is not brought in contact with any hard substance, and thereby broken, the proprietor furnishes pouches with straps to go over the shoulder and around the body, which will be sent with the clock, if ordered, for \$2.50. The instrument will in all cases be warranted perfect and satisfactory. Its price is invariably seventy-five dollars, including as many keys as are requisite, not exceeding twelve, payable in United States currency.

This watch-clock is sold at a less price than any other in the market. The Detector is used extensively by large manufacturing establishments and railroad companies in the United States, from whom numerous testimonials have been received. Parties purchasing these clocks should

test them sufficiently in the counting-room or office, as they will not be taken back after having been injured by the watchman through carelessness. This Detector is covered by two U. S. Patents. Parties using or selling these instruments without authority, will be dealt with according to law. All communications addressed to J. E. Buerk, proprietor, 47 Congress street, Boston, will be promptly attended to.

To TEST THE PURITY OF FLOUR.—A simple mode of doing this, by means of chloroform, has been proposed by M. Rakowitsch. The flour is mixed with chloroform in a tube. The pure flour is held in suspension, while the damaged flour, the bran, the mineral matters, the ergot of rye, and other impurities, are not so held. The amount of humidity is determined by adding spirits of wine of 95°, which precipitates the flour. The more humid the flour, the greater the quantity of spirits required.

BUERK'S WATCHMAN'S TIME DETECTOR.

result in the dismissal of the untrustworthy servant, or his retention and reward if found worthy.

The annexed engraving is a view of a Time Detector, which is carried about by the watchman to all the different stations to be guarded. At each station is a small key, securely fastened to prevent his taking it with him. The watchman goes from station to station, takes the key fastened there, inserts it into the clock, gives it one turn, and goes on to the next, or to any other station, for he is not bound to go in regular order. By this it follows that a perfect record will be kept of each operation.

The broken out portion of the watch shows the mechanism which operates the pin which pricks the paper. At A, there is a number of sliding bars which connect with the pricking points, so that, by turning round the key, the ward on it strikes a certain bar and penetrates the dial paper B.

The watch is wound, set and closed each evening by the proprietor or superintendent, and the box locked with a key which he keeps, so that the register within is unseen by, and out of the reach of, the watchman who carries it. In the morning, when the Detector is returned to the superintendent, the graduated disk of paper may be removed from its position and filed, like a telegraph dispatch, as a permanent record, while a new disk is applied for succeeding records.

This Watch Clock was introduced to the public in almost every section of the United States and Canada several years ago, and it has proved itself to be the best invention in the world for testing the faithfulness of watchmen. Since its introduction, the proprietor has improved on some parts, and corrected deficiencies which have been suggested by using it, until he claims that he now has a perfect check upon the watchman. With other clocks a regular routine

Zinc and Electric Desilverization.

The extracting of silver from lead with the aid of zinc is a metallurgical theory of some years' standing, which has never been successfully reduced to practice. A new process, with the agency of zinc, has been patented in England by Herr Flach, of Prussia, through which it is claimed an entirely pure lead can be produced, not alloyed with zinc as formerly, and that there is a grain of from 3 to 4 per cent. of silver, as compared with the Pattinson process. An alloy of zinc, silver, and lead is formed, which is skimmed from the surface of the molten lead, and afterwards run down with silicious fluxes, and the final regulus of lead is subjected to cupellation.

Following close upon this dubious improvement is another process patented in England by Mr. W. G. Blagden, of Hackney Wick. It relates to the application of electricity to the molten lead, with which a small quantity of zinc has been incorporated. The recent advance made in the cheap production of electricity, is paying the way for its introduction into metallurgy as a new force in the conversion of substances. The *London Mechanics' Magazine* says that the operations of Blagden's process may be carried on in a pot similar to those used in separating silver from lead by Pattinson's concentration process. Before the lead is conveyed into the pot it may, if requisite, be placed in a reverberatory furnace, and there be submitted to a preliminary refining process, which may be conducted in the ordinary way. The object of this preliminary refining process is to remove by oxidation any portions of copper, antimony, arsenic, or other matters that the lead may contain; but in some cases, where the lead contains no other impurities than a little dross, the operation may be dispensed with altogether. Under ordinary circumstances, the average duration of the process is about twelve hours. From this reverberatory furnace the lead may be run or otherwise conveyed into the before-mentioned pot, which has been previously heated to prevent the lead from cooling or to facilitate the melting. The temperature of the lead is then brought to, say, about 430° Reaumur, in order that the zinc, to be subsequently added to it, may melt with it. Practically, the temperature may be considered about right when it is impossible to keep the hand at a distance of two and a half feet from the molten metal. The molten metal is then skimmed, and the dross thus removed may be treated in a reverberatory furnace with the next charge of lead, which undergoes a preliminary refining process. The object of this skimming is to remove all the impurities still retained by the lead; the dross will be treated again in order to extract the lead that is mixed with it mechanically. A quantity of zinc equal to about one-third to one-half per cent. of the charge of lead in the pot is now introduced into the molten lead by means of a suitable instrument, and the whole is then thoroughly and carefully stirred until the mass is well mixed. The instrument found best adapted for this purpose is a ladle provided with a cover and a long handle and perforated with a number of small holes. This ladle, containing a quantity of zinc, is placed in the molten metal, where it is allowed to remain till all the zinc has melted and passed through the small holes. The metal may be stirred by means of this ladle or other stirrers; if the mixture of the metals is not complete, the zinc will separate in lumps instead of forming a crust on the surface. An electric current, which may be generated by a suitable battery, in connection with one of Ruhmkorff's coils, or otherwise, is caused to pass through the molten metal; this current, which produces among other effects, in most cases, a certain tremor in the mass of metal, is continued for a period varying from ten to thirty minutes, according to the quantity and purity of the lead under treatment and to the proportion of silver it contains. The conductors used are rods of copper with wooden handles; two, four, six, or eight of these conductors may be suspended in the metal in any convenient manner; the current should be continued until all the zinc has reached the surface, when it ceases to have any action on the desilverizing of the lead. Towards the close of this operation it is advisable to begin to reduce the fire under the pot, in order to facilitate the solidification and separation of the alloy of zinc and other metals or impurities which are being formed. After the conductors of the electric current have been withdrawn from the molten metal, it is allowed to remain at rest and to cool for about a quarter of an hour, and the crust which in the mean time has formed on the surface of the metal, is then removed. By reducing the temperature in this way the alloy of

zinc becomes solid, and separates itself more readily from the masses of molten lead. The temperature found desirable for removing the crust is between 360° and 370° Reaumur, or when the metal has become solid round the sides of the pot to the extent of about half an inch. In removing the crust from the surface, a certain quantity of lead is always carried away too; but this is easily recovered in the subsequent treatment of the alloy. The temperature of the metal is now raised to say 430° Reaumur, and the operation of introducing from about one-third to one-half per cent. of zinc, followed by the application of the electric current and the removal of the crust, is repeated in the manner already indicated. When the lead under treatment is very impure, or contains a large proportion of silver, it may be necessary to repeat this process a third time or more, in order to desilverize the lead sufficiently. It is found desirable from time to time to make an assay of the metal in the ordinary way, with a view to ascertain what quantity of zinc, if any, it may be requisite to add to it, or whether the lead is desilverized to the required degree, say at least 1-500th per cent. The silver, which is contained in the various crusts or skimmings taken from the molten metal after each addition of zinc and passage of the electric current, may be recovered by any of the ordinary methods. The lead, when sufficiently desilverized, is conveyed to a reverberatory furnace, which has been previously heated, and there undergoes a refining or annealing process, in order to remove the zinc and other impurities which it has retained. The process lasts about three hours, and it is desirable to carry it on with a brisk flame. Thus purified, the lead may be run into ingots for sale.

MINING THE BEST INVESTMENT AFTER ALL.—Thos. Spargo in the *London Mining Journal*, April 11th, says: "It can now be scientifically determined whether ground is ore-bearing, and the skill of the mining engineer enables him to prepare an estimate of cost more accurate than is found in any other department of works. It may occur that the lode lies deeper than was expected; that it turns out poorer than the first yield could justify any one in supposing; that an incursion of water should happen, or some 'fault' be discovered; but the mishaps incidental to building such a ship as the Great Eastern or the Warrior, of laying down a line of railway, tunneling a mountain or under a city, of creating extensive irrigation works, or a ship canal, are of more frequent occurrence. Yet men will invest in such undertakings, and neither be warned or intimidated by loss after loss; while if every mine is not found to be a 'lode of wealth,' the utmost disappointment is experienced, and the business itself characterized as too uncertain for legitimate investment. If there were more hazard to the adventurer, which I deny, there is a more chance of splendid success. Which of all the departments of industry deemed most successful, has heaped upon its persevering followers such rich rewards? Great fortunes have been made in cotton-spinning and weaving, but wide spread loss and ruin have again and again swept away the property of the cotton districts.

Ship building has enriched enterprising persons, but how often has the storm scattered the fleets? The colonial produce-grower, in the cotton field, the indigo, or coffee plantation, etc., has often come home the victim of disease, and more frequently ruined by the failure of crops. Now, in mining, no such perils exist. The lode fails less frequently than the foreign produce crops. An inundation does not occur so frequently as a shipwreck, the storm that spoils the merchant sweeps over the miner harmlessly; he is, in fact, more free from the danger of losing the fruit of his capital than any other adventurer whatever; and every farmer, every grower of produce, every cattle breeder, merchant, and manufacturer is an adventurer as much as the investor in a mine, without having ground so sure to work upon, or chance so glorious of a magnificent result."

TO CLEAN LEADED DUST.—The following recipe for this purpose, which we clip from an exchange, may not be familiar to all of our readers:

Put the dust on a shovel or pan, heat it red hot, then put on grease and let it blaze till all is burnt dry; next put it in strong vinegar or acid, and let it remain twenty-four hours, when it will be clean and bright.

STOPPED.—The English system of delivering the mails on the New Haven express trains, without stopping them, has been abandoned.

The Microscope in Geology.

At a meeting of the Geological Section of the Birmingham Natural History and Microscopical Society, Mr. Allport read the following paper on some new minerals discovered by him in the South Staffordshire district:

In 1865, Mr. Forbes stated, in his report of the British Association on the Igneous Rocks of South Staffordshire, that they are composed of four minerals; and in a paper on British Mineralogy in the *Philosophical Magazine* for November, he has increased the number to seven by adding iron pyrites, hexagonal prisms of apatite and a zeolite, which appears to be hecitolite. I first called his attention to the two latter minerals in May last, having discovered them a short time previously—the hexagonal prisms in a very coarse-grained portion of the rock from the Hailstone Hill, and the hecitolite (?) from a new sinking at Deepmoor. Since that time I have made more than 30 sections of this rock, and have detected at least seven different minerals, of which the following is a list: Labradorite, augite, a green mineral probably chlorite titanoferrite, iron pyrites, a brown zeolite probably pectolite, apatite, olivine, epidote, a pale green mineral, undetermined, which forms an amygdaloid, and a light purple mineral which occurs in thin plates in the feldspar; this, I think, is a species of mica. The green chloritic mineral is highly characteristic of the rock which occurs in sheets and bosses in the coal measures, locally known as green rock. At the Hailstone Hill, I have observed a number of veins containing a real zeolite. They are well worth attention; and a careful study of them, both *in situ* and microscopically, has clearly shown them to be contemporaneous with the formation of the rock itself. In some cases I have succeeded in tracing them from end to end in the solid basalt, and find that they terminate in mere points, being entirely surrounded by solid rock. In other instances, however, I have traced veins of red mineral across the joints and columns; and as these were doubtless caused by the contraction of the mass in cooling, the evidence as to their age is tolerably conclusive. The proof derived from a microscopical examination is equally clear, for I find that the veins consist of precisely the same minerals as those forming the compact rock, but with the difference that they occur in larger and more perfectly developed crystals; a fact which may readily be explained by supposing the veins to have been cracks formed in cooling, and then either partly or entirely filled up by the still liquid interior being squeezed into them. The presence of the zeolitic mineral in such abundance is also an additional proof that this is the correct explanation of their origin. Many of my sections clearly show that this mineral was introduced subsequently to the consolidation of the rock, as it occurs in cavities, and also fills up the spaces between the different crystals. In some cases it lines the cavities, having been deposited in layers, differing from each other in color and thickness, precisely like the banded agates. Such cavities and spaces would naturally occur more frequently among minerals which crystallized in spaces large enough to allow them to be formed slowly, and without interfering with each other.

SIZE OF BRAIN IN DIFFERENT RACES.—Dr. J. Barraud Davis in a paper recently communicated to the Royal Society, gives as the result of his investigations upon this subject, the following figures: The average English brain weighs 47½ ozs.; French, 45½; Italians, Lapps, Swedes, and Dutch nearly the same as English; Hindoos, 44 1-5 ozs.; the aboriginal Khonds of India, 37 4-5 ozs.; Chinese and Siamese, 47 ozs. Of the African races, the northern have from 44 to 46 ozs.; the Bushmen 31 to 39; the Kaffir over 48 ozs.,—a greater weight of brain than the average Englishman. The Malays have over 47 ozs. of brain. Unless, however, the calculations were based upon the examination of a large number of skulls of each race, they are not particularly valuable.

NEW PLANET.—On the 17th of February M. Borelly, of the Marseilles Observatory, discovered a telescopic planet, which is the ninety-sixth now known, the orbits of which are between those of Mars and Jupiter. The same was discovered three nights later, by M. Loewy, at Paris.

Amalgamation Compared with Smelting.

The question which is the best process for the beneficiation of silver ores, is frequently asked; but it is one which cannot receive a general answer. Amalgamation, indeed, possesses certain advantages, among which the most important are; its simplicity; its periodical completeness (giving opportunity for comprehensive supervision and exact control); the rapidity with which it produces the silver from the ore; the great saving of fuel it involves; and the greater security it affords (when the amalgamation is cold) in comparison with processes involving the use of lead, for the health of the workman.

The silver in an ore submitted to amalgamation can be obtained and transformed into money in a few days. Very little of it remains in those products which must be worked over again; and hence it is possible almost every week, to calculate accurately how economically the ore is benefited; how much silver is being lost. Indeed, we are able to ascertain daily, by examination of the tailings, the degree of perfection attained by the process, and to remedy with promptness, where remedy is required. Not so in smelting. Here only a portion of the silver is collected by the first operation in the lead; another and larger portion hides itself in matrics, clinker metallic combinations, and slags too poor to smelt, or, at any rate in products which never allow of accurate assays, which must pass through the fire repeatedly (and generally with fresh ores), and which suffer new losses at every process; so that many months may elapse before the whole of the silver, sent at any time in the form of ore to the works is transformed into a marketable product, and a cleaning up, a correct estimate of the percentage of loss, and of the assets of the works are but seldom possible. The contents of the slag from smelting do not give nearly so good an indication of the completeness and success of the operation, as is afforded in amalgamation by the contents of the tailings.

On the other hand, however important these advantages of amalgamation may be, it is never to be preferred as a mode of treating plumbiferous silver ores, nor in districts where fuel is cheap and abundant, and lead has but little value, while mercury and salt are difficult to procure. A proportion of gold or of copper in the ore may also, in many cases, decide the question at once, in favor of smelting. But where fuel is scarce and constantly rising in price; where the ores, perhaps, are difficult to smelt besides, where lead is not at hand, and must be purchased abroad, or where the silver is already chloridized in the ore (hornsilver), there amalgamation is the right thing in the right place, and its use may sometimes save mining enterprise from ruin.

Ores which are too poor in silver to be at once economically smelted with lead, will ordinarily be too poor also for immediate amalgamation. In both cases, a crude smelting must first be performed, the silver concentrated in a rough matte, and the latter smelted or amalgamated, according to circumstances, instead of the original ore. In Freiberg, where both smelting and amalgamation are practiced, the profit of the latter is greater; but it would be unfair to draw general conclusions from this fact, since the poor ores are sent to the smelting works, while only those ores are amalgamated which are sufficiently rich to be treated without concentration. The cost of the preparatory crude smelting of the poor ores, is of itself enough to produce the appearance of inferior economy in that process; and hence the Freiberg figures do not represent a fair comparison of the two methods.

The above is from a series of papers, translated for the *American Journal of Mining*, from the German of K. A. Winkler.

MAN IN THE DAYS OF EOOZON.—Mr. G. Henry Kinahan says: The Biblical record may be sneered at because human remains have not been found except among the most recent of the tertiary deposits. In answer to this, I may be allowed to put forward Col. Greenwood's suggestion; that there is only negative evidence against the existence of man and the other land animals from the earliest periods. "Where," he says, "are the fossil remains of land quadrupeds found? In cavern deposits, in drift and alluvium, in filled-up lakes, in hogs, or frozen up in polar regions. Now all these land mammals are not only modern, but superficial and temporary. They are liable to be washed into the sea; and their fossil contents must be destroyed before they can be redeposited in marine strata."

Mechanical.

THE SMOKE QUESTION.—Mr. G. Holt recently delivered a lecture upon this subject at the Literary Institute,—says the *London Mining Journal*,—in the course of which he spoke of one invention, which he said struck at the root of the evil, and was, “without question, one of the most thorough and scientific yet brought out for the consumption of smoke.” The essential features of this invention are that the bars of the fire-grate are sloping at an angle of 45°, and that the sides and back of the fire-place are also grated, supplying fresh air continually to the hottest part of the fire. The sloping grates admit of the slack being supplied by means of a hopper, so as to avoid the use of doors, and the slope of the bars causes the fire gradually to settle to the bottom as it becomes thoroughly heated, so that all the fresh coal is at the front, and any smoke from the front must pass over the main body of the fire. This scheme seeks to allow no waste carbon to escape as smoke, by admitting air through the fire. There are several collateral advantages with this scheme. The side bars are wider apart towards the bottom of the fire, so that by a better supply of air a greater heat may be obtained. The level portion of the fire-grate at the bottom is movable, and fitted with a lever, which causes it to slide in and out on rollers, so as to let out ashes or, if need be, the whole of the fire into the ash-pit below. Again, the slope of the bars, and the gradual manner in which the slack settles down on the fire, enables it to cake together in masses, which keeps the bars unchoked, and thereby admit more air. Also, from having no doors to open and shut great injury to the boiler by the alternate cooling and heating of the boiler-plates is avoided.

SMOKE.—A great deal has been said about the various plans for preventing smoke, and avoiding the waste of fuel consequent upon it. A writer in the *London Mining Journal* recommends *silver* as a preventive. He says that an official connected with the City of Dublin Steam Packet Company found out long ago that two shillings extra on the weekly wages of the stokers when they did not make smoke, and one shilling fine when they did, made them careful to push the red hot coals in the furnace well back, and feed the fresh coal near the mouth; thereby effectually preventing the making of smoke, and economizing fuel. The company made money by the arrangement.

SAFETY RAILS.—Dr. A. W. Hall, of New York city, has invented an arrangement for preventing the accidents by breaking of rails, which have within the past year caused such frightful destruction of life. It consists in a supplementary rail, inside of each of the ordinary rails. The flange of the wheel passes between the two rails. The wheel has a “tread” inside of the flange as well as outside; but the former does not touch, unless in case of the breaking of a rail. Old rails may be used for the safety rails. The safety-tread may be cast without a chilled face, giving it all the tenacity of soft iron; thereby adding to the safety of the wheel, by lessening its liability to break. The *American Artisan* describes and illustrates this invention.

LEAD FLOATING ON IRON.—Melted lead, which has a specific gravity of 11.5 will float on melted iron, which has a specific gravity of 7. This has been recently explained by Prof. Karmarsch, of Hanover, who finds that the lead when melted forms a hollow spheroid, which is filled with some vapor of lead, making it specifically lighter than iron. In smelting, however, certain ores of iron which contain lead, the lead is found at the bottom, where, owing to its specific gravity, we should expect to find it.

HARD STEEL.—We have already spoken of J. P. Smith's extremely hard steel from pig iron by a new process. The *London Mining Journal* recently received a piece of the metal, with the fractured edge of which, glass was cut into strips as if with a diamond. Attempts were made to fray the edges with different files, new and of the best quality; but without more success than if they had been coconut husks.

SELF-LIGHTING GAS-BURNER.—A new burner of this description, illustrated in the *Scientific American* for May 9th, has a miniature supplementary pipe by the side of the main nipple. This receives its supply of gas from a channel cut from the main supply aperture in the cock partially around its circumference. When the gas is turned on to the main burner, the supply to the supplementary burner is entirely cut off; but when shut off from the primary or principal burner, a small portion escapes through the auxiliary, being lighted in the instant of turning off by the flame from the main burner, in consequence of the rapid spiral of the channel cut in the circumference of the cock, which is simply a “fast” screw thread. In lighting, the jet of gas from the auxiliary tube, when the cock is turned, “jumps up,” and ignites the gas from the main tube. The small tube, of course, burns gas when the main tube is not acting, but the amount thus burned is slight and proves to be far less expensive than the use of matches and other appliances for lighting gas. A bowl or cap protects the small jet from being extinguished by currents of air.

SILVERING HOOKS AND EYES.—A patent has been granted in Bavaria, for the following method of silvering hooks and eyes made of iron wire. The articles are suspended in dilute sulphuric acid until the iron shows a clean, bright surface. After rinsing in pure water, they are placed in a bath of a mixed solution of sulphate of zinc, sulphate of copper and cyanide of potassium, and here remain until they receive a bright coating of brass. Lastly, they are transferred to a bath of nitrate of silver, cyanide of potassium and sulphate of soda, in which they quickly receive a coating of silver.

FEEDING STEAM BOILERS.—The *London Mining Journal* of April 11th, says: As an improvement upon the present mode of feeding steam boilers, Messrs. H. Davey, of Gunislake, and D. Davy, of Sheffield, propose to mount a wheel, with recesses upon its circumference, upon centers in a casing, so as to turn freely; this casing is provided with two openings, one communicating with the boiler below the water level and the other with the steam space. It is further provided with openings to the supply tank. The openings are so arranged that as the wheel revolves the chambers are emptied into the boiler. The apparatus is made self-acting, by arranging the inlets for the water so that it impinges in an inclined direction upon the wheel cavities, causing it to start in the required direction, the motion being further maintained by the weight of water being on one side of the wheel only.

DIAMONDS FOR GLASS CUTTING.—Great care and skill are necessary in selecting the cutting points, because the diamond that cuts the glass most successfully has the cutting edges of the crystal placed exactly at right angles to each other, and passing through a point or intersection made by the crossing of the edges; a polished diamond, however perfect may be its edges, when pressed upon the surface of the glass, splinters it with the slightest pressure; but with the natural diamond the most accurate lines are produced on glass, and their surfaces are so highly furnished that, if ruled close together, they decompose light, and afford the most beautiful prismatic appearance—all the colors of the rainbow flashing from them as from the silvery interior of a pearl oyster shell. Diamonds are also employed to drill points to perforate rubies, and bore holes in draw-plates for fine wire, and also for drilling in hard steel.—*Artisan.*

STEEL ROPES.—Messrs. Howell & Co., of Sheffield, have proposed the use of ribbons of steel in the place of wire for the ropes of suspension bridges. A specimen of this laminated rope, consisting of 48 laminae, 3 in. wide and 1-16 thick, would, according to their statement, require 720 tons to break it, and would not take any permanent set with less than 30 tons per square inch. It would be easy to place each strip over the space to be crossed by the bridge, laying the strips carefully on each other, and when the required section is attained, binding them together with wire or with clips to prevent moisture from entering between them. Such a rope would be stronger, and much more easily erected, than one of wire with the wires parallel over the span. And it would be much more rigid than a wire rope of twisted strands, and probably also more durable from its greater compactness. *Engineering.*

Scientific Miscellany.

CHEMICAL GEOLOGY.—David Forbes, F. G. S., delivered a lecture on this subject before a large audience on Feb. 25th. He considers that a combination of the Plutonian and Neptunian theories will best account for the phenomena that present themselves to the geologist. He showed that silica occurred in nature as an igneous product in recent lavas; that it occurred as an aqueous product in different forms deposited from solution; and as a gasolytic product in tubes from the decomposition of fluoride of silicon. He believes that both sedimentary and eruptive granites exist. He considers that the whole of the earth's constituents, being once in a state of vapor, arranged themselves in zones according to their densities; and that consequently the central nucleus of the earth must contain an accumulation of the denser metals and their compounds. The fact that while the mean density of the earth is about 5.4, the density of the exterior crust is only 2.75, supports the hypothesis. At the moment of solidification, the earth must have formed a true sphere; but the outer crust becoming subject to volcanic and other forces, the surface would soon be broken up into mountains and valleys, and subsequent aqueous action would produce other changes in the first formed rocks. Metamorphic action, promoted by heat, pressure, chemical action, aqueous or gasolytic agency, or all combined, would continue to go on, and would produce the condition of things which we now find. *The Quarterly Journal of Science* gives an outline of the lecture, which we condense as above.

PANGENESIS.—Mr. Darwin has recently published a new work, in two volumes, on the “Variation of Animals and Plants under Domestication.” *The Popular Science Review* speaks of it as “Mr. Darwin's masterpiece of scientific essayism;”—and closes its notice of the work by calling attention to Mr. D's new theory of “Pangenesis,” giving a brief outline of it in the following words:

The tissues of the body in both male and female (plant and animal) are constantly throwing off minute atoms, which, under favorable circumstances, are capable of reproducing the particular tissue from which they are derived. These accumulate in the ovum on the one side and zoöperm on the other, and in the union of these two the elements of the tissues and organs of the two individuals combine. Accordingly, therefore, as one or the other of these elements predominates, the resultant will resemble the male or female parent. But it sometimes happens that the two antagonize each other; and, when this occurs, a certain number of the molecules of the early ancestors, which have lain dormant like so many “statohlasts,” come into play and produce reversion.

PLANTS AND ANIMALS.—Prof. Huxley is this year giving his lecture as Hunterian Professor, on the Invertebrata. He does not believe that a sharp line can be drawn between plants and animals, but would regard man and the magnolia tree as extreme terms of one long series, diverging on the one hand to the vegetable, on the other to the animal kingdom.

ORIGIN OF BACTERIA.—Frau Luders, a German lady, and a microscopist, has proved that *Vibrio* are produced from the spores of various fungi. Prof. Hensen of Kiel, supports her assertions. She thinks that the blood of living animals contains these organisms; but that they remain quiescent until, after death, putrefaction commences. Prof. Hallier, a great authority upon such matters, has recently identified a distinct form of fungus in the blood of typhus fever patients, and another in vaccine matter, etc.

ACTION OF THE INDUCTION CURRENT UPON PLANTS.—M. Blondeau has carried still further the experiments upon the vegetable organism to which we have before alluded. The ripening of fruits was hastened by the current. Apples, pears and peaches which had been acted upon by it, reached complete maturity long before other specimens from the same tree which had not thus been operated upon. French beans germinated more rapidly when thus treated, and the plant was more vigorous. Singularly enough, some of these beans germinated downwards; the cotyledone remaining in the ground, and the roots rising in the air. M. Blondeau infers that the embryo has, like a magnet, its neutral line and its two poles.

DISSOCIATION.—M. Dührée says that a hydrated salt has for each temperature a tension of dissociation which is measured by the elastic force of the aqueous vapor which it emits at this temperature. A salt becomes hydrated, when the tension of the aqueous vapor contained in the atmosphere is greater than that which the salt emits at the same temperature. Efflorescence results when the tension of the water-vapor of the salt is greater than that of the aqueous vapor existing in the atmosphere.

CRYSTALLIZATION.—M. Auguste Bersch has found that Epsom salts (sulphate of magnesia,) dissolved in beer, with a small quantity of dextrine (artificial gum), and applied to a pane of glass with a sponge or brush, will, on crystallizing, produce designs identical with those fantastic but symmetrical figures which may be seen of a frosty morning upon the window panes; with this improvement, however, that the liquid may receive any color whatever, at the option of the operator. M. Kuhlmann, on being apprised of the fact, conceived the idea of going a step further, and transferring those fairy-like creations to stuffs and paper. For this purpose he first got the crystallization on sheets of iron, on which he afterwards laid one of lead. By means of a powerful hydraulic press the minutest details of the figures in question were durably imprinted on the soft metal, and a copy of them in relief was then obtained by galvanoplastics. But here another difficulty arose. In the impression of cotton stuffs the pattern must be continuous; whereas in M. Kuhlmann's plates the lines at one end would clearly not coincide with those at the other, so that disagreeable interruptions would be caused in the printed designs. This obstacle, however, has been overcome in a most ingenious manner by effecting the crystallization on the cylindrical surface of a roller. A slight rotatory motion imparted to it will prevent the liquid from accumulating at any particular point before it has evaporated.—*Galignani.*

BLOW-PIPE REACTIONS.—Capt. W. A. Ross, R. A., has detected some peculiar blow-pipe reactions. Having fused a borax bead in the usual way, he charges it with the substance under examination, and then blows the bead into a small bubble or vesicle of extreme thinness. After standing for some hours, the vesicle exhibits under the microscope a peculiar crystalline structure, often of great beauty; and as this structure apparently varies with the nature of the dissolved substance, it promises to become of value in blow-pipe analysis. “Every metal, with its salts, appears like a kind of mineralogical kaleidoscope, throwing its crystallization apparently at random into the most elegant shapes, each of which must be made to yield its atom of information as to the source of all.”—*Quarterly Journal of Science.*

VOLUMETRIC DETERMINATION OF ACETIC ACID.—The fact that acetate of soda gives a violet tint to the litmus paper, makes this determination by means of hydrate of soda solution difficult; as it prevents the chemist from knowing the exact moment of neutralization. The difficulty is obviated by employing tincture of curcuma as a test. In the presence of free acid it remains yellow, but it turns brown immediately when the acid is neutralized.

SPECTROSCOPE.—Prof. Oshorn, of Lafayette College, has so modified the spectroscope that he can detect, from a room many hundred yards distant from a furnace, the sodium in the coal or decomposed fire-brick proceeding from the furnace mouth; also any lime or potash that may be present.

Plaster of Paris---Gypsum.

Among the many numerous articles of importation to this State, is gypsnm or plaster of Paris, of which some 1,500 barrels is employed here monthly, all of which has heretofore been imported. It is gratifying to note, in the history of our industrial progress, the fact that a discovery has recently been made on the peninsula of Lower California, which will place us independent of Eastern shippers for this commodity, and enable us to lay down the article in this city cheaper than it can be obtained in the city of New York. The location of the discovery alluded to is near Loreto, opposite Carmen Island, and within half a mile of a good harbor. The deposit is said to be unlimited in extent, and the gypsum of a quality nowhere excelled. It was first found upon the ranch of Mr. Newton, from which it has been traced to the adjoining property of Capt. Hyde. Capt. H. is an American, who has been for thirty years a resident of that part of Mexico; Mr. Newton is also an American, and until recently a resident there for many years. Aside from its present value, this discovery is almost invaluable with reference to its probable future demand as a fertilizer. A considerable shipment has already been received here, and a quantity has been ground at the reduction works of Mr. Howland, on Market street, and converted into stucco work; which experiment has given a full and practical proof of its value, even for its most difficult employment in the arts.

Gypsum is a hydrated sulphate of lime, consisting of sulphuric acid, lime and water, and may be represented by the following formula: $\text{CaO}, \text{SO}^3 + 2\text{HO}$. It is met with in greater or less abundance from the Devonian, through the carboniferous, even up to the alluvial deposits. Its production is supposed to be due to the decomposition of iron pyrites and carbonate of lime in juxtaposition. It is found wherever sulphuric acid is generated and comes in contact with limestone. It is usually more or less colored by oxide of iron or other coloring matter, occurring of all shades from a transparent white, to yellow, brown, red and sometimes black.

Gypsum is extensively used for making plaster casts and for stucco, and as a fertilizer. When used as a plaster of Paris for stucco, etc., it is first ground to a fine powder, and then calcined by being placed in open kettles, set as if for boiling water. This process is technically called "boiling," and by it the water of crystallization is driven off. When in that state, if wet to a pasty consistency and placed in a mold, it most accurately takes the form of the mold, and becomes indurated in a few moments. It can be so prepared, however, as to delay the indurating process for hours instead of minutes. No art has yet been devised by which its powers of induration can be repeated after being once used.

This material is extensively used in the Eastern States and in Europe as a fertilizer. Its fertilizing effects are too well known to need any extended notice. The exhaustive system of farming practiced in California will doubtless soon create a large demand for this product, and it is a matter of no small congratulation to learn that it can be furnished on this coast in unlimited quantity, of superior quality and at a price about one-third less than that at which it can be delivered in New York. Its greatest value as a fertilizer is for grasses and root crops, although it is used extensively for grains. When used for grains or grasses, it is pulverized and spread over the surface of the ground when the weather is wet or the earth moist; for roots it is placed in the hill at the time of planting. The value of peat ashes for manure is chiefly due to the gypsum which they generally contain.

Alabaster is a very finely granulated variety of gypsum. Gypsum is quite variable in character, occurring compact, foliated, fibrous, highly crystallized and often transparent, like mica—in which latter form it is often mistaken for the latter mineral, and it very closely resembles.

COCONUT FIBER FOR UPHOLSTERY.—

Nature has ever been lavish in her provisions for the supply of man's physical wants. Food, both animal and vegetable, nuts and fruit, are found everywhere and in every variety, ready furnished for all, savage or civilized. But while the necessities for existence are amply provided, the comforts and luxuries demanded by each advance to a higher civilization, have often taxed the ingenuity and intellect of man, to the utmost, in turning the raw material to good account.

The savage kills and eats, as one of the lower animals preys upon another. Civilized man appropriates hoof, hide and hair,—bones as well as body and blood. The Hottentot, with a degree of intelligence but little above the ape, cracks the coconut for its milk or meat. But he who brings shell as well as kernel into subserviency to his wants, has a harder nut to crack.

Mr. John Perry, of this city, by a process entirely new, is now engaged in the manufacture of the fiber of the coconut to be used for mats, matting, beds, sofas, lounges, and all upholstering purposes. Various, and many fruitless attempts have been made to find a cheap and durable substitute for feathers and curled hair for chairs, cushions, and mattresses, at the same time obviating the objections to pulu, shavings, soap root and other material, on account of dust, weight, offensive smell and liability to breed vermin or insect life. Mr. Perry is fully confident that he has found in the fiber of the coconut, a material possessing all the requisites above mentioned, without the objections; while in point of lightness, purity, durability and elasticity, it stands unrivalled; being entirely freed, in the process of preparation, from all deleterious vegetable matter, and consequently not liable to rot after years of exposure to dampness. With the view of being able to supply all the demands of the trade for this new textile, Mr. Perry has purchased a half 50-vara on Chestnut street, between Polk and Larkin, and put up all the necessary buildings and machinery for conducting the business on an extensive scale. Thousands of dollars have been expended in fitting up the establishment. One large tub, say forty feet in circumference, with some fifty stamps for reducing the fiber, was built by E. O. Hunt of this city, at a cost of some \$1,500, saying nothing of the labor and expense required for the complete equipment of the whole. We have had the pleasure of going through all the different departments of the manufactory. We examined the various rollers, tubs, stamps, pickers, and other fixtures, with the view of giving the whole process in detail; but owing to the difficulty, in the absence of illustrated cuts, of making the subject clear to the general reader, we dismiss it for the present, hoping that all who are interested in this line of mechanical industry, will avail themselves of the privilege of a visit to the establishment and a personal examination of the prepared fiber, together with the whole process of its manufacture.

The coconut is procured at Honolulu, Tahiti, Fanning and other neighboring islands, in any desirable quantity, and is brought by ship-loads to this market. While the fiber has been extensively introduced into England for upholstering purposes, Mr. Perry, we believe, was the first to invent a process by which the raw material is taken through all the different stages of preparation,—a process *sui generis*,—consisting of a series and combination of machines, novel alike in both construction and arrangement.

A NEW LUBRICATING OIL, of eastern manufacture,—said to be a combination of mineral and animal oils,—has been introduced here by A. C. Dietz & Co., manufacturers and importers of machinery oils, coal oil, lamps, etc., 521 Front street. The Excelsior Machine Oil, we understand, has been brought into general use throughout the Atlantic States,—where it has been pronounced superior, for lubricating purposes, to the best sperm or lard oils,—being represented as 75 per cent. cheaper, wearing longer, cleansing the machinery from all accumulated gum, and leaving the machine after wiping, perfectly bright and clean. See advertisement.

Foundry Work—The Pacific.

A renewed activity has become manifest in Mexican mining affairs since the comparative quiet secured in that country by the reestablishment of Juarez. Satisfactory results are also being realized. This city is beginning to feel the benefit of such an improved state of affairs, in the consequent orders which are coming in for machinery, etc. The Pacific Foundry is now shipping, for that destination, a large amount of irons—such as doors, grate hars, stirrers, etc., for roasting furnaces; also a number of Varney Pans and Settlers, with shoes, dies, etc. These castings are chiefly ordered from Sonora, and are to be employed in enlarging and refitting existing works, which have been suspended during the late political disturbances in that country.

The same foundry has just sent off a 10-stamp mill, complete, for the Pioneer Mill Co., at Warner's Diggings, in the northern part of Idaho Territory. Several smaller mills were sent to that district from the same foundry last year, and a large amount of machinery is also finding its way thither from the East. This promises to become one of the finest mineral regions on the continent as soon as the Pacific railroad and other accessories to travel and transportation, which will be connected with that great enterprise, are fully in operation.

A mill, engine, boiler and pair of hoisting reels for the Turner's Flat Gravel Co., is in course of construction; also the necessary gearing to drive a 6-inch "American Submerged Pump," which, it will be recollected, was fully noticed and illustrated in our issue of April 25th. This experiment will give that new invention a fair test of its utility and capacity for a mining pump.

The Pacific folks are putting up one of their new engines—the Hartford, Wright's Patent Variable Cut-off—at the Golden Age flouring mill of D. Conroy & Co. This engine has a 22-inch cylinder, with three feet stroke. One of these engines was put up six months ago at the Crown Point mine, which has thus far given the fullest satisfaction. A duplicate of the same has been ordered for the Pacific Mill, at Silver City, which is now being built at the Pacific Foundry. One of the same engines is also being built for exhibition at the forthcoming exhibition of the Mechanics' Institute.

This is a new steam motor which has recently been introduced upon this coast, and which appears to be giving much satisfaction wherever it has been used. We shall soon give an illustrated description of the engine. They are also putting up the machinery in a stern-wheel steamer, recently built for Capt. Wiley, and now lying at Long Bridge, and intended for the grain trade in the waters about this harbor. The same parties have also recently built and put up an air pump at the Empire and Imperial shaft, at Gold Hill. This pump is sixteen inches in diameter of bore, and is employed to force air into the shaft for ventilating purposes. The *Territorial Enterprise* of the 27th inst., speaks of this pump as "working exceedingly well," and that by its aid "there is at present no visible or known reason why the drifts may not be driven through the ledge without further hindrance."

There is also being built at this foundry, for the Florida mine, near Austin, an 8-inch bore Cornish lift-pump, of six feet stroke, with all the gearing, etc., to drive it, with 500 feet of discharge pipe. This pump is to be completed within one week from the time the order was received; such haste being required by the exigency of matters at the mine, where the water has recently gained so rapidly on their present pumping works as to drive the workmen from the lower drift, where the company is now obtaining their best rock.

NEW INCORPORATIONS.—Articles of incorporation have been recently filed in the County Clerk's office in this city as follows: BOYD SILVER M. Co.—May 26th. Capital stock, \$1,600,000; 1,600 shares, \$1,000 each. Trustees: Wm. M. Lent, J. W. Mackay, Geo. Hearst, Joe Clark and David Fay.

A NEW EXPLOSIVE COMPOUND.—Mr. Hefenegger, of this city, has submitted to our inspection a new explosive compound which he has recently invented, and which appears to merit no little consideration. This compound differs from ordinary gunpowder, in being made more powerful and rapid in its action, in both of which respects it very much resembles nitro-glycerine and the so-called "giant powder;" but unlike either of those compounds, it is applicable for use as rifle or gunpowder. In some experiments which were made a few days since in our presence, a block of iron, with a bore in its upper surface, was charged with six grains of Hefenegger's powder and fired, with a small anvil weighing six pounds placed over the bore; the anvil was thrown from its seat, while two ounces of gunpowder did not move the anvil. Sixty grains of the new compound (one-eighth of an ounce), threw the anvil forty feet into the air. A 4-inch shell, with a chamber only one inch in diameter, was charged with half an ounce of the preparation, and burst into numerous fragments. Common gunpowder could not have hurst such a shell.

This compound is perfectly safe to handle and transport, and undergoes no chemical change or deterioration by the lapse of time. The preparation is made from dry compounds, and can be prepared of any desirable strength, so as to be used as a detonating powder or for common gunnery. The inventor has also a self-igniting match which is made upon the spot, by simply placing a few drops of a liquid preparation upon any combustible substance, such as paper, linen, cotton, etc. The liquid can be so prepared as to ignite spontaneously in from five to fifteen minutes, or longer if desirable. All the experiments made were accomplished by this self-igniting liquid, no ordinary match being used in firing any of the charges. We have no time or space to-day to go into any detail with regard to the use or value of these new compounds, but shall refer to them again in a future number. The inventor has taken the necessary steps to secure letters patent for his invention through the MINING AND SCIENTIFIC PRESS PATENT AGENCY, and would like to secure the aid of some capitalist to develop the invention for an interest in the same. Any person desiring further information with regard to this invention can obtain the same by inquiring at this office.

ARTISTS' EXHIBITION AND SALE.—The artists of San Francisco will hold a sale on Thursday evening, June 4th, at the auction rooms of Messrs. Duncan & Co., Montgomery street. As they participate generally, the contributions to the sale, which will partake of the nature of an entertainment, will be choice, as well as varied and extensive; so that all will have an opportunity to fully gratify their taste. If we may judge the productions of others from the artistic display and variety in the form of landscape, lake, river and mountain scenery, recently seen at the studio of D. H. Woods, on Kearny street, this will doubtless prove one of the finest exhibitions of the kind ever presented in this city. The California scenes cannot fail to attract attention, particularly those embracing views of the Stanislaus, Tuolumne and Bear rivers. Some of these are not only beautiful and picturesque, as to grouping, coloring and perspective, but exceedingly life-like and true to nature, bringing back to one the life of other days and its sweeter memories.

COLLEGE COMMENCEMENT.—The first commencement at the City College, corner of Stockton and Geary streets, took place last evening. The exercises were held in Calvary church, Bush street. The degree of A. B. was conferred upon two candidates. These have completed the full course of four years, and are the first graduates of the institution. An address was delivered by Rev. Dr. Woodbridge, of Benicia, and a poem read by Rev. F. Buel. The occasion was an interesting one.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

Alpine County.

Chronicle, May 16th: The I X L Company have decided to turn to and take ore out of their mine—the first quality to be worked, and the second to be laid aside for future operations. It is about time this company exhibited some signs of life. The second class ore of the I X L mine will pay more than the best rock taken from many of the rich mines of Nevada.

A shaft is to be sunk on the Summit Ledge, the extension of the Pennsylvania, in Raymond District.

Same of 23d: At no time has the prospect been so flattering for Alpine as the present. In the Silver Mountain District several of the best claims in the county are being worked with energy. The work progresses steadily, night and day. The I X L Company are getting out ore; the Pittsburgh have struck one of their ledges and are now sinking an air shaft. The company are negotiating for the purchase of Whiteside's mill; the Pennsylvania tunnel is going ahead finely; this week it passed through a stratum of quartz showing ruby silver. This company are liable to strike their ledge at any moment. The prospects of the Rippon are favorable. The Mountain Tunnel is in over 1,400 feet, but has not yet cleared the hard rock. The rock is hearing more sulphurets. There are no idle men in Silver Mountain. The Mount Bullion Company are making fair progress with their tunnel, and the same may be said of the Imperial Company. At Monitor there is very little doing. There is a prospect that work will shortly be commenced on the George Law claim at Markleeville. The St. Helena Company, near Markleeville, have levied an assessment. In the Raymond District the Illinois-California Company are pushing ahead with their tunnel, and work has been commenced on the Summit claim.

Miner, May 23d: The Morning Star shipped for San Francisco this week eight sacks from the lower level of the mine. This ore is for smelting in the Haskell furnace, one of which it is the intention of the company to erect, if it should succeed as is anticipated.

On Wednesday the Pittsburgh Company completed negotiations for the purchase of the Whiteside mill. The mill is a good one of two small batteries, with pans, settlers, and all fixtures complete, and the price paid \$2,500, is only a fraction of its worth.

At the Mt. Vernon mine on the Napoleon lode between Antelope and Slinkard valleys, they have for several weeks past been drifting on the ledge in ore, and have a vein from 8 to 10 feet in width, the full body of which will go from \$30 to \$35 per ton.

Amador County.

Ledger May 23d: The Oneida, with its 60 stamps, is not allowed to remain idle a moment. The works at the mine are now in perfect order, and they experience no difficulty in keeping the mill supplied with paying rock. The last clean up was good. . . . The quartz now being taken out of the Couey & Bigelow mine proves richer the deeper they go. The mill, 26 stamps, is kept in operation day and night.

Butte County.

The Oroville *Record* of the 16th says: The owners of a quartz ledge near Dogtown, on the west branch of the Feather river, while prospecting about two weeks since, struck a pocket, and in less than two hours took out \$1,200.

Calaveras County.

San Andreas Register, May 23d: The new mining district above El Dorado is attracting much attention. Bean & Smiley are, we learn, taking out hundred-dollar rock. The Lodi claim has a tunnel now in about 150 ft. From this tunnel they have taken a large quantity of quartz, which pays them about \$100 a ton. Their last clean up was seven pounds of thoroughly retorted amalgam. The assay shows that the gold from this lode is worth \$18.78 an ounce. The Washington claim, some two miles from the Lodi, is said to be exceedingly rich. We predict that a few months hence, there will be a large and prosperous town in this vicinity.

H. Smith, J. Guider and John Kelley have struck a vein of dirt near the Brewery, in town, which is said to be exceedingly rich. They pick up pieces of gold weighing, some of them, as much as \$3.50, and have taken out of the gravel \$17.50 in a pan of dirt.

The Homestake Company at the Junction, Chili Gulch, have struck gravel which is paying them well. They have got as high as \$15.75 to the pan of dirt.

Nevada County.

Transcript, May 21st: The Badger Hill and Cherokee Gravel Mining Co. has been incorporated. The capital stock is \$250,000, and the company is designed to work the blue cement channel running through Badger Hill.

Same of 23d: A ledge has recently been opened by Mr. Stede, just beyond the establishment of Cashin, Kent & Co. The vein is large and the rock looks fair. The Sneath & Clay mill, recently leased by Mullory & Emory, will commence crushing rock from the ledge in a short time.

The Potosi mine on the ridge above Gold Flat, near the Wigham mine, was last worked by a perpendicular shaft, but has remained idle for some time past. Thos. Mien and others have commenced sinking a new incline higher up, for the purpose of opening the ledge.

24th: At Moore's Flat, the severe winter, has somewhat interfered with mining operations, but the hydraulic companies have all been washing for some time past. They have not cleaned up yet.

The Kentucky Co. had their pump broken lately, and their shaft filled up, delaying the prospecting. They have the large huckets at work, and will soon have the shaft clear.

25th: The North Star mine still continues to yield rich ore. At Findley's bank, this morning, we saw two pieces of ore from the mine, one of which weighed 46½ pounds, the other probably about 40 pounds. Rich, heavy sulphurets, mixed freely with gold, could be distinctly seen through the pieces.

27th: The Boston Co. has located 1,200 ft. of ground on Steep Hollow, near Lowell Hill, for hydraulic mining. The ground extends from the Sacramento claims to the Lower Hill reservoir.

Gazette, 26th: The Sneath & Clay mill which has been idle for the past year, was started up again yesterday. Messrs. Emory & Mulloy, the lessees, have everything in first rate order.

The Buckeye Co., formerly the North Star Mining Co., on Rock Creek, started up their new steam hoisting works on Monday, the 18th inst., and are now hoisting the water from the claims. They will commence taking out gravel this week from the 215-foot level.

Grass Valley *National*, 19th: Since the Powning Bros. leased the Rannels ledge, they have sunk a shaft and found a good prospect. Three loads of rock, crushed by the Hitchen's Bros., at Larimer's mill a few days ago, yielded about \$100.

Placer County.

Dutch Flat Enquirer, May 23d: We learn that the Dutch Flat Co. in drifting from the bottom of their shaft, have disclosed a body of cement in which gold in paying quantity is plainly discernible.

Plumas County.

Quincy National, May 16th: Messrs. McGee & Thompson of the Mammoth quartz mine, intend to commence crushing on the 1st of June. They have completed their tunnel, 1,600 ft., which taps the ledge at the Traugh chimney, 300 ft. below the old level, and 700 ft. below the surface. The ledge averages about six ft. wide of pay rock, some of which is remarkably rich.

The Crescent commenced running sixteen stamps on the 8th inst.

Same of 23d: Messrs. O'Neill & Van Norden have struck some new ground in Nigger Gulch, that prospects well. It seems to be an old channel, and "pans from the top down"—some 15 ft. The company are at work upon a ditch, to bring in the water from the Elizabethtown Flat.

North Fork items: Tom Orton is working with a rocker, and is making an ounce per day to the hand. . . . Joe Hickman panned out 12 ounces in two days, last week. . . . Thompson & Mather have their ditch completed, and will commence work on their claims immediately. They have big prospects. . . . Mr. Drake is making an average of six dollars a day to the hand. Water is plenty on Red Rock and the miners are all doing well. . . . Wagner & Ferguson, at Dutch Hill, had two days' run at the time of a heavy rain, and cleaned up \$800. . . . A new claim in Butt Valley, owned by G. W. Miller, is paying eight dollars per day to the hand. . . . The boys at Barker Hill are preparing to haul dirt, and expect to make big pay.

Siikyou County.

Yreka Union, May 23d: The miners on Humbug are about through with ground sluicing for this season, and most of them have commenced to wash up. We understand the yield is generally satisfactory.

Mr. Steele informs us that he succeeded in securing below some aid in opening and working the "steamboat" claim on McAdam's Creek.

Sierra County.

Downieville Messenger, May 6th: The Independence Quartz Mining Co. are putting up a new mill, in a situation where there will be no danger from snow slides. The mill will be in working order before winter sets in.

At Camptonville, McLellan & Co. and Hugg & Co. are taking out about \$1,000 a week each from their claims below town.

Poverty Hill letter: P. Cunningham, of the Old Paddy Bull claims, from present indications, will take out about \$25,000 this season. Union Hill, Messrs. Miles & Co. are taking out good pay.

Letter from Seale's diggings: The bedrock tunnel of Cox & Co. is still progressing. . . . The Boice Bros. are preparing to blast their bank of gravel which is hard and rich. . . . The hedrock tunnel of Laferty & Co. on Gold Run is being driven ahead as fast as two shifts of good workmen can be expected to run in passable rock. . . . The Kingdon Bros. on Poverty Hill have struck a streak of gravel far richer than ever before found on the hill.

Same of 23d: Letter from Forest City: Mining here continues about the same. The Live Yankee, as usual, has quite a comfortable weekly yield. The Young America is, I think, improving. The Adella, at Rock Creek, I understand, gives first rate indications. The Old Union quartz claims at French Ravine, that used to pay so richly, has been purchased by J. W. Moyle and several other gentlemen. The mine will be immediately reopened.

The Brush Creek Mining Co. at the Mountain House, is going ahead energetically. They employ quite a number of men.

Sacramento County.

Folsom Telegraph, May 23d: Willow Spring Hill is still yielding its thousands. The claims in the hill which were supposed to be worked out years ago are richer than ever, and are likely to continue so, from present appearances, for many years to come. A one-fourth interest in a claim on the hill was sold a few days ago at \$1,700.

Tuolumne County.

Sonora Democrat, May 23d: At Brown's Flat, the Mississippi claim cleaned up 46 ounces last week, six men's labor.

The New York claim cleaned up 16 ounces during the same time.

The Ophir company are extending the main flume up the creek to their claim.

A gentleman from Big Oak Flat informs us that the Rattlesnake mill was started last Monday, and will be kept running steady. Men are working night and day, in the mine, and very fine looking rock is being taken out.

Yuba County.

Appeal, May 20th: George Leland writes from Brown's Valley, that the Rattlesnake has struck within a few days very rich quartz in two of their pay chimneys, nearly at the same time. The quartz resembles more than I have ever seen before, the rich quartz of Grass Valley.

Same of 21st: Yesterday the Pennsylvania Co. shipped five tons of sulphurets to the Grass Valley sulphuret mills, which are expected to yield from \$200 to \$400 per ton.

ARIZONA.

Miner, May 9th: In Walker's district, Poland & Pierson have recently worked in an arastra, 15 tons of Benicia rock, which paid them over \$400. The ledge is not a large one, but all the rock in it pays something. They have several tons more now on hand, which they will work soon. . . . A French has been working ore out of his Tie-Tie, and is well satisfied with the result of his last clean up. . . . R. Winning and McWilliams will immediately start their arastra to grinding Deposit rock.

In Hassayampa district, the Chase mill is prepared to run, and teams are now hauling ore from the mine to the mill. Work upon the tunnel has been commenced. . . . Roddick & Feland in the Chance lode, are hoisting very rich silver rock. The placer mines on the creek are doing well.

In Turkey Creek district, work upon the Gross lode is being vigorously prosecuted, by Messrs. Slack, Linn and Shupp.

In Walnut Grove district, as soon as the planting season is over, work will be started upon several rich mines.

Quartz mining is at a stand still in Big Bug. . . . The companies engaged in placer mining are doing well. All winter and spring they have made, on an average, from four to ten dollars per day to the man.

Jim Thomas has sold his interest in the old Mexican gulch, to a company of Coloradans.

We have heard it intimated that several mills that are lying idle in Yavapai County will soon be set to work.

Recently, at the Big Bug mill, William Gavin built a small arastra, which he run with a small turbine wheel of his own

make. He put into the arastra about three panfuls of tailings, which he picked out of the creek, ground them for three hours, and got \$11.66.

In Weaver district, the Mexicans are still working in the old diggings in the vicinity of Weaver.

In Wickenburg district, work will soon be commenced on the first extension east, of the Great Vulture Lode. They were at latest dates getting very rich rock out of the tunnels. Their mill would be ready to start soon.

Little & Taylor's hydraulic claims, on Lynx Creek, about eight miles east from Prescott, have been paying well, and their owners are well satisfied. Last week, three men in five days, took out \$145.50.

COLORADO.

Denver News, May 6th: About 25 mills, averaging 18 stamps each, are now running constantly in Gilpin county alone. Besides these are the Peregrine mill—the new 12-stamp mill just erected by Mr. Miller; and 20 in the old Eagle mill, by Terry, Smith & Co. Then there is a scheme afoot for building a 40-stamp mill on North Clear Creek; another for a 100-stamp mill at Idaho; and the latter part of the summer will probably see 12 or 20 stamps put into the old Tiger mill. There is hope that the Narragansett mill—40 stamps—will again run before long. Black Hawk will be producing ore by July. Consolidated Gregory Co. are getting to work. The Bohtail confederate pump is at last in good shape, so it is not too much to expect that next August will see 800 stamps in constant use in Gilpin county, producing \$286,000 per month. It is probable a Kenyon mill, of capacity equal to 40 stamps, will be erected at Idaho soon. This is also the intended site of a new 100-stamp mill. Along the creek above Idaho, far more activity than ever before is now observable. The Alden, Syracuse, Fairmount, Piasa, Lincoln, Boston, Colorado and other companies will continue the opening of new mines. Two or three mills are doing very well at Empire.

In Boulder county it is the same story. The same holds true of Park, Summit and Lake counties. New discoveries of both gold and silver lodes have been made within a few months in Park and Lake, and especially to the latter is there likely to be a grand rush. Great preparations are making to work the placers of this and Summit more systematically than in former years. The placer mines of Colorado will produce a million dollars' worth of gold in 1868. In Summit, reduction works will be multiplied this year. On the whole the mining outlook is better for 1868 than we ever knew it. . . . The Colorado Co. is developing the National Treasury lode, and have opened a vein of ore three ft. wide at a depth of 52 ft. . . . Mr. Collum is taking out a fine quantity of ore from his lode on Bear Creek. . . . Mr. Slawson is tunneling for the Potosi lode. . . . Mr. J. W. Partridge informs us that he is to commence work on his copper mines near the South Boulder at once. He has made contracts with the Union Pacific Railroad, and other roads, for conveying his ores.

Central City *Herald*, May 6th: A little party of miners cleaned up a pound of the clean Clear Creek dust on Saturday evening last. They struck a rich streak from which they took \$40 in two hours. . . . Fred Horn, who owns the gulch claims above and below the Wright mill, showed us the result of a three days' run, three men. The result was at the rate of \$6 per day to the hand. . . . Charlie Tyre is working in the Golconda lode, in Spring Gulch, Clear Creek, and is running the ore in an arastra. He is taking out \$175 per cord in gold, and also saving a good deal of silver. . . . Pullerton & Conway are running the Holman mill, north of Chase Gulch, on wall rock and tailings, with good results. . . . Fred. H. Conant resumes work next Monday on the Adaline G. M. Co's claims, Central City. . . . Mr. Borham and the Miller Bros. have leased the Rogerson property on the Bates or Hunter lode, and commenced sinking a new shaft. . . . The Black Hawk Co. have commenced hoisting material from claim No. 1 Gregory, and also have made an improvement in their shaking tables. The company are running 80 stamps on custom ore. . . . The miners on South Clear Creek took out six pounds last week. One hundred miners are at work on the creek, all doing well, and 500 more men could do equally as well. Joe Lagoo & Co. have struck good pay, and Clifford & Co. struck ounce diggings on Friday last.

DACOTAH.

Cheyenne Argus, May 6th: In regard to the Sweetwater mines, we have received from parties writing to their friends in this city, information on the whole very satisfactory. Several lodes have been sunk on during the last two or three months, and the indications are favorable. The Atlantic bids fair to eclipse any gold mine on the

continent. One company on this lode have sunk to a depth of 75 ft., and the body of pay ore varies from 18 to 19 ft. in width. The ore is expected to average \$50 to the ton.

In gulch mining, very little progress had been made. The miners had, however, commenced washing on one creek near South Pass City, with good results. One company is making from \$15 to \$20 a day to the man.

IDAHO.

Owyhee *Avalanche*, May 16th: Trask & Son have turned Jordan Creek out of its old bed and are blasting rock to deepen their tail-race. The ditch that will supply the arastra is completed, and the water-wheel ready for putting together. It is expected that the arastra will be ready for operation about the first of June. The Whisky boys are engaged in preparing for the erection of a whim. The ledge has been traced north from the main shaft several hundred feet. Work will be resumed in the Omega in a few days. Parties are at work sinking on the Sotoma. It is said to prospect well. On the Poorman, a splendid triple shaft is now completed to a depth of 45 feet, and will be used for the main hoisting shaft upon the arrival of the steam engine, now on the way. Work has been resumed on the Calaveras. The north shaft on the Woodstock is now down 25 feet below the level of the tunnel, and shows 20 inches of solid quartz, with smooth casings. The ore is very rich in silver, and in much of it gold is plainly discernible. The ore is divided into two classes, one of which, it is thought, will yield \$800 per ton. The Woodstock Company are using the "Giant Powder," and speak very highly of it. On the Minnesota, the south shaft is down some 90 ft., and the north shaft 60. The Oro Fino Company are at work, although they cannot operate advantageously till their hoisting works arrive. In one place, recently struck, the ledge is from 7 to 8 feet wide, and good pay rock. On the Ida Elmore, several hundred tons of ore are now ready for hauling. The ore is of almost fabulous richness—much the same as the Golden Chariot. We noticed car load after car load of glittering ore coming out of the Golden Chariot. Much of it is so rich that it is hoaxed up to prevent visitors from carrying it away. Five large ox teams were engaged in transporting it to the Sinker mill. A large space is being graded away where the steam hoisting works, which are expected to arrive soon, will be placed. Some parties have obtained the privilege of washing the refuse dirt at the Golden Chariot dump, and are making good wages thereat.

The *Statesman* of the 9th furnishes the following from Alturas county: The Casco Company are nearly ready to commence running on their Wide West rock. The Lucy Phillips Company are busy getting out timbers at Yuba for their 20-stamp mill, now on the way from Umatilla. The Idaho Company are pushing through their new tunnel. Chas. Woodward has his new mill about completed, and will commence crushing as soon as animals can get into Yuba. This will be in a week or two. Two double arastras are running at Rocky Bar, and have all the \$50 rock they can crush. Two others will soon be at work. Placer mining is being vigorously carried on. Water is plenty.

MONTANA.

Helena *Post*, May 9th: Floyd, Bateman & Co. have completed their hydraulic works on Ten Mile Creek above the cañon. They have 600 in. of water with 50 ft. pressure. The average pay of the Bateman claim last year, when worked by a ground sluice, was \$10 per day to the hand; its present yield is about \$30 per day to the man.

On Spring Creek, a tributary of Lincoln Gulch, as high as \$4 to the pan has been taken out. Mining commenced on last Thursday, but on Friday the ditch broke and work was suspended until it could be repaired. Mining is in active progress now. From some refuse dirt, merely run through the sluices to get it out of the way and not expecting it would yield anything, one company cleaned up \$400.

L. H. Hershfield & Co. have purchased the Baker mill now situated on Blue Cloud lode, which they propose moving immediately, and locate upon celebrated Thomas lode near Cable City. This is a 20-stamp mill complete in every particular.

At Diamond City, the yield in the gulch (Confederate) is as rich as ever. Mr. McGregor averages a round thousand per day. Head & Co., the next claim above McGregor's, declared a dividend of over \$4,000 last week. The great water pipe which was finished on Sunday afternoon, worked to a charm. A large concourse of people were on the ground.

Mr. Esler has sold the Argenta furnace to Capt. Guyer, who proposes to run it as soon as he can procure a smelter. Mr. E. failed on account of the closing in of his creditors upon him at the moment of success. He took out \$14,000 worth of silver bullion in 75 days, leaving, in fact after paying for the building of the furnace, there was really a net profit of \$2,000. Col. Wood at Bau-nack had almost concluded to wind up under the same circumstances, two attachment suits being commenced against him; but he persevered, and last week settled up the suits. In another month he will be independent.

ESMERALDA.

NEVADA.

Aurora *Union*, May 16th: Kearns, Olsen & Co., struck a small ledge a few days since, at Bodie, of extraordinary richness. They have already taken out about eight tons of rock which issued to literally glisten with the precious metals. Owing to the deep snow and deep mud on the road leading to the company's arastras, they have not had a crushing yet. This company have also another ledge which is no bad thing, as they already have a hundred tons of ore out of it, the yield of which is estimated at \$100 per ton. Mooney & Co. have a large amount of good ore on their dump. The Swanson Bros. are said to have struck a very rich deposit in their mine, and are getting out first class ore. Each company has a large water-power arastra on Rough Creek, in which they believe they can save as large a per cent. of the metal in the ore as can be obtained by working in the best mills.

Mr. P. P. Moses, who has just finished building a mill for Toombs & Abraham at Pine Grove, informs us that times are very flush, and that two more mills will probably be erected there during the summer. Each claim, being worked, says Mr. Moses, can more than supply a first-class mill with good paying ore.

J. J. Poor, who recently purchased the mine on Last Chance Hill, out of which Arnold & Co. made a neat little fortune of fifty thousand or upwards, in a few weeks, is said to be doing very well. The ore is not so rich as when Arnold & Co. were working the mine, but good enough yet to pay a very large profit for extracting and working. Mr. Poor is said to have realized a handsome little sum from the dump left by Mr. Arnold, from which he has assorted a considerable quantity of very rich ore.

The difficulties between the Catterwood and Kentucky Cos. at Palmetto have been amicably settled. Arrangements have been made for the immediate erection of a mill in the district. The mines are said to be looking remarkably well and the company already have a large amount of good ore on the dump awaiting the erection of the mill.

PAHRANAGAT.

Austin *Reveille*, May 22d: Mr. George E. Clark, has furnished us notes of his visit to Pahrana-gat: At Crescent City I found quite a little mining camp, and the mill of the Crescent Company, partially finished, suspended for want of funds. At the claim on the List lode belonging to this company I saw about 25 tons of good milling ore on the dump. At Logan's springs, two miles off, I found some Chicago men engaged in smelting. At the Illinois lode, I was happily disappointed. The lode cuts the spur of the mountain at right angles, and is accessible from the summit to the bottom of the cañon, a distance of about 1,000 ft. The company is crowding the development of the ledge as fast as possible. A shaft is sunk directly on the ledge to the depth of 100 ft., and two tunnels are being run from the north and south sides of the mountain for the purpose of tapping the shaft and giving a current of good air. Work is suspended on the Webster claim.

RESE RIVER.

Silver Bend *Reporter*, May 16th: The Silver Queen ledge, near the Champion, a mile and a half northwest of town, shows at the surface a vein of rich ore two or three feet. At a depth of near 30 ft. it widens to six or seven feet. A vertical shaft is now in progress, and will soon reach the vein.

Mr. Bauer has sent from the Ophir mine to the Manhattan mill, at Austin, about a ton of ore for a test. Within three months it is supposed the company will be at work upon the Ophir and other mines in that district, with ample capital to develop and place them in proper shape.

A small test lot of 2,372 lbs. of ore from the Savage lode, in Montezuma district, 50 miles south of here, in this county, worked at the Manhattan mill, at Austin, recently, gave a pulp assay of \$293.77 to the ton.

Pleasant Valley district, in East White Pine, seems destined to become famous for its production of rich silver ore. The Hidden Treasure vein, owned by Wm. McCauley, Frank Drake and others, has a width

of 16 ft., at the depth of 14 ft. It is a mass of mineral of the richest character, yielding so far as tested \$500 to the ton. The Aurora is the property of Drake, McCauley, Leathers and Linsey. It is about three-fourths of a mile south of the Hidden Treasure, and the ore is identical. A shaft has been sunk upon this about 14 ft. deep, and a cut about 20 ft. long made across the ledge, but at the time our informant left, had failed to reach the opposite wall. The Monte Christo mill, a small 5-stamp affair, is situated 20 miles westerly from Pleasant Valley district and mines.

WASHOE.

[In the Stock Circle, in another portion of this paper, will be found late mining news from this district.]

Territorial *Enterprise*, May 19th: Two hoisting tanks are again in operation at the new Imperial-Empire shaft. At noon yesterday, the water stood in the shaft eight ft. above the floors of the drifts. The tanks are kept going constantly, and as each holds 600 gallons, the water is fast decreasing. Drifting will be resumed as soon as the water is out.

Same of 21st: From what we have learned, the soldiers have found very good diggings in the Independence Valley region. About 25 miners are engaged in working the mines discovered, which are mostly placer, and are doing very well. The gold is worth \$13 per ounce. A party from Austin are making arrangements to erect a 10-stamp mill on a lead owned by them, the ore from which they think will pay \$40 per ton. Independence Valley is 60 miles north of the Humboldt River.

22d: The Imperial-Empire has shut down again for repairs. They will be completed in 48 hours.

23d: From the office of Wells, Fargo & Co., in this city, there were shipped during the past week, 1,208 pounds of assayed bullion, valued at \$83,406.20; from the office of Wells, Fargo & Co., Gold Hill, 4,624 pounds, valued at \$117,871.64.

24th: The Imperial-Empire works are again in operation, and all is going ahead as smoothly as could be desired.

The Alpha Co. are about to resume operations. The machinery is being overhauled. The Imperial-Empire shaft has drained the mine, and the company can now resume mining in the lower level, where they were obtaining ore of an excellent quality last fall when struck by an overwhelming influx of water.

Trespass, 23d: In the Sierra Nevada, work progresses very satisfactorily. The Ophir shaft is being sunk in good ground, and reasonable progress is reported. Lady Bryan just about pays expenses. In the Gould & Curry, the water has been exhausted from the shaft. Drifting is to be commenced. The Savage is yielding about 1,350 tons per week of ore that will average about \$32. Station No. 6 progresses, and a drift will soon test the ledge from the lowest level. In the Hale & Norcross, the drift from the winze, at a distance of 79 ft., cut the ledge. It showed some little ore mixed with quartz, but before developed was flooded with water, and operations were suspended. The drift at the lower station will probably penetrate the ledge in about two weeks. In the Chollar-Potosi, the incline is down 206 ft. and the work yet continues. From the Blue Wing station, west portion, ore is being extracted which pays for reduction. In Alpha, yesterday, a force of mechanics went to work putting the machinery in repair, preparatory to prospecting in the mine. The Imperial-Empire shaft, it is believed, has exhausted nearly all of the water from the west side of the hill. In Bullion, the drift at the 1,200-foot level remains unchanged in appearance, cutting through a mass of dry porphyry, with no present indications of quartz. The Imperial is yielding the usual quantity of ore, and has been entirely drained through the new shaft. A new lot of machinery has been substituted at the shaft, and the water which was above the drift is draining to the track floor. In the Occidental the usual quantity of ore is being taken from both the upper and lower levels, yielding an average of \$22 at the mill. In the Yellow Jacket there is no change in any of the prospecting drifts. Enough low grade ore is being extracted to keep the Morgan mill employed. Next Monday the work of letting down the pump column for a new level will be commenced, and continued as rapidly as possible. The Kentucky mine presents no change whatever, and is yielding daily about 90 tons of excellent ore. In Crown Point, the south drift is looking better, and the east cross-cut of 17 feet has developed some good ore. The upper levels are yielding the usual quantity of first-rate ore. In the Belcher, at the 850-foot level, the drift cast 130, the

north drift 345, and the cross-cut west, have developed a body of clay with traces of quartz. The clay has been cut through, and a stratum of porphyry developed with considerable water. The east drift has been discontinued. In the Overman, the ore extracted is of very low grade, and hardly pays for reduction.

NEW MEXICO.

Santa Fe *New Mexican*, May 5th: New towns are springing up in several quarters like Elizabethtown in Mora, and Central City in Grant counties, which bid fair to become thriving and populous business centers. Elizabethtown is a thriving, busy town of near a thousand inhabitants, and with thousands of miners near and around her. An immense influx of population is anticipated this spring and the coming season.

Mesilla Valley letter to *Donver Herald*, dated April 16th: The Pinos Altos miners are jubilant. New discoveries have been made of quartz leads of exceeding richness. Much gulch gold is also being taken out in Pinos Altos and Fort Bayard districts.

OREGON.

Mr. R. V. Short has left with us, says the *Enterprise*, a fine sample of almost pure copper, found in this county, near Boone's Ferry, Clackamas County. Mr. F. M. Shaver found it about two feet under the surface, where he was excavating for gravel. There can be no doubt about the genuineness of this article, and we are informed that since the discovery, evidences have been found that the quantity is almost inexhaustible.

PROTECTION TO THE EYES OF WORKMEN.

Dr. Cohn, of Breslau, has been collecting statistics in regard to the manner in which the occupation of metal workers affects their eyes. Of nearly 1,300 men, belonging to six engineering establishments, examined by him, he found that more than 600 had been at some time or other under medical treatment for the accidents to the eye incident to their business; and that, too, on an average twice each, making the total number of accidents requiring medical aid almost equal to the number of men examined. Most of these men had objections to the use of spectacles, as being too easily broken; and on that account, not only expensive, but dangerous. It occurred to Dr. C. that spectacles made of mica might answer; and the trial so fully realized the hope, that they have already come generally into use. The *Mechanics' Magazine* thus describes them:

"The mica spectacle glasses are curved somewhat in the shape of watch glasses; they not only protect the eye in front, but their frames fit closely round the eye sockets, so that no chips can enter from any part, and still the eyelashes do not touch the glasses. The frame is made of thin brass wire, which can easily be bent into any shape. As hinge joints would have caused too much expense, the side parts are soldered on to the frame. The thickness of the mica is about one-twenty-fifth of an inch. These mica spectacles, besides protecting the whole eye, have the following advantages: First, they cannot be broken; heavy blows with a sledge hammer only squeeze them flat, without breaking the glasses. They may be thrown to the ground with full force without being damaged in the least. Red hot metal poured on the mica does not make any impression on it. The shower of pointed particles of iron which issues from lathes, etc., only rebounds from the perfectly elastic mica glasses. Secondly, they weigh only about one-half as much as glass spectacles. Thirdly, they keep the eyes of the workmen cool, mica being a very bad conductor of heat. Fourthly, they are very much cheaper than glass spectacles. They are sold at Breslau for about eightpence, English money, apiece."

SIGNALS ON SHIPBOARD.—Telegraphic signals are now designed for use on shipboard. On a naval steamer, a circular dial, with movable hands and indicatory words, is fitted on deck; a similar dial is placed in the engine-room, or on the gun-deck, or at the rudder, each connected by metallic air-tubes with the one on deck. The officer wishing to give an order turns a handle fitted in the side of the dial by which be stands, and instantly the same signal appears on the steersman's dial, and he obeys the order. In the same way, the captain may send his commands to the captains of the guns, or to the engine-room.

Mining and Scientific Press.

W. B. EWER, SENIOR EDITOR.

Canvassing Agents.

Our PRINTER can do much in aid of our paper and the
cause of practical knowledge and science, by assisting our
Agents in their labors of canvassing, by lending their influ-
ence and encouraging favors. We shall send none but
worthy men.Mr. A. C. Knox, is our city soliciting and collecting
Agent, and all subscriptions, or other favors extended to
him, will be duly acknowledged at this office, Jan. 11, 1886.
Mr. C. T. Raney is our duly authorized agent for
Sacramento County, Nov. 23, 1887.Dr. L. G. Yates is our duly authorized travelling
agent, July 6, 1887.
Mr. A. B. Butler is a duly authorized travelling
agent for this paper, July 15, 1887.

San Francisco:

Saturday Morning, May 30, 1868.

Notices to Correspondents.

ACEQUIA, Santa Barbara.—Few improve-
ments can be named that possess such a
durability as those erected for irrigating
purposes, when properly constructed.
The walls, hanging gardens and towers of
Babylon and Nineveh, have long since
disappeared amidst the rubbish formed
by their own decay; but the constructions
for irrigation and raising water still re-
main on the banks of the Euphrates and
Tigris. In mediæval history, the Moors
stand foremost in systematizing irriga-
tion, next to whom, historically, may be
classed the people of northern Italy.
But of modern improvements in this re-
spect, nothing is to be found of equal
grandeur with the irrigation works
formed during the last twenty years in
British India, which, when completed,
—and they are rapidly approaching this
point,—will, it is calculated, totally pre-
vent in future a recurrence of those des-
olating famines which have formed such
blemishes in its history; the East and
West Jumna, the Ganges and the Sut-
lodge are amongst the largest works of
the kind. The length of the main lines
of the West Jumna canal, is 445 miles.
The Sutledge canal discharges a volume
of 2,500 cubic feet per second, and irri-
gates an area of 312,000 acres. The
Ganges canal has a total length of 898½
miles. Every circumstance associated
with the physical features and climate
of California, combine to point out irri-
gation as being a most desirable invest-
ment.

R. C. B., Drytown.—We are unable to say
whether the drill, about which you in-
quire, is shaped by hand swedging or by
machinery. With regard to the effect of
swedging or pressing steel into shape as
compared to shaping by the hammer, there
can be no doubt but that the hammering
is much preferable, from the fact that it
is impracticable by the former method to
bring the particles of steel into so close
contact as by the latter. By the blows of
a hammer a much greater force is concen-
trated and brought to bear upon a small
point than is practicable where the com-
pressing force has to be applied to every
part of the surface at the same instant of
time. No process of tempering can remedy
the defects arising from an imperfectly
hammered piece of steel.

L. F., Sierra county, wishes to know if
there are any parties in this State, who
are willing to undertake a contract for
deep boring, as for the ventilation of a
mine. The mine in question is a placer
claim, situated in the ancient drift or
"deep diggings" of Sierra county. The
formation of the hill through which the
boring will have to be made, is a cement
or lava formation, and very hard, and
the bore would have to be about 600 feet
deep. The object is to secure ventilation.
If any persons would like to undertake
such a work we should be pleased to put
them in communication with our corre-
spondent.

CARBON.—The beds of coal recently report-
ed to have been again allowed to be
worked near Pekin, belong, we believe,
neither to the carboniferous beds of the
Eastern States and Europe, nor to our
California coal beds, which latter, per-
tain to the cretaceous age; but according
to Mr. Pumpelly, the Chinese coal
beds belong to the Permian system, or
the last of the Paleozoic series, being
immediately overlaid by the New Red
Sandstone, or Trias of the German geol-
ogists.

The "New Flux" for Gold.

For nearly a year past various Eastern
journals have, from time to time, been mak-
ing mention of what is claimed to be a new
agency for the separation of gold from its
ores or matrix—under the designation of
"The Stevens' Flux." We have hitherto
refrained from making any extended notice
of the same, from the fact that we had sup-
posed that this, like all other new things in
the way of metallurgical operations, sug-
gested by persons having no extended prac-
tical acquaintance with the subject, would
soon be forgotten, from the lack of its ap-
plicability. But as the subject seems to
have been again brought prominently be-
fore the public, in consequence of some ex-
periments recently said to have been made
in Boston, and for the reason that it has
now been placed before the people of this
State through one of our prominent com-
mercial journals, we have thought it proper
to inform our readers of what the supposed
improvement consists, and caution them
against placing too much confidence in
the over-wrought statements of Eastern or
any other journals, which are not supposed
to be thoroughly informed upon such mat-
ters.

With the usual assurance of proprietors
of new processes, it is claimed, not only
that this flux is new, but that by it "a
much larger amount of gold can be ob-
tained from the same quantity of ore, than
can be had by any other process or means
known in mining." Indeed, it is claimed
in an article from the *Boston Post*, which
was noticed at considerable length in the
San Francisco Evening Bulletin of Monday
last, that at a recent experiment in Boston
\$431 to the ton was taken from ore that
would yield but \$22 to the ordinary work-
ing process.

With certain ores, as for instance those
containing a very large percentage of sul-
phurets, such a result might be possible;
but no metallurgist, who understood his
business, would subject such ores to any
ordinary process. There are well known
processes by which such ores can be worked
fully as cheap and probably cheaper than
by the use of "Stevens' flux." If the ores
worked were free from sulphurets, the state-
ment of the difference of yield between the
two processes is simply absurd.

The Stevens flux is nothing more nor less
than the residuum thrown aside from the
works at Natrona, near Philadelphia, which
works consume a large quantity of the min-
eral, cryolite, in the production of soda.
This residuum consists of a fluoride of cal-
cium, intermixed with the earth alumina,
and a little silica, carbonate of lime and per-
oxide of iron. An analysis of this product
gives substantially the following:

Fluoride of calcium.....	50.87
Alumina and peroxide of iron.....	21.95
Carbonate of lime.....	5.87
Lime.....	7.63
Silica.....	3.61
Water.....	10.04
	100.00

It will be seen from the above analysis
that the chief value of this flux is due to
its characteristic ingredient of fluoride of
calcium, which occurs in nature as fluor-
spar, and which is well known as a valu-
able flux, for which it has been used in
the laboratory from the earliest days of
metallurgical operations, as well as on a
working scale. The advantage of the addi-
tion of a chloride, (as common salt) as used
by Stevens, is also well known. The chief
advantage derived from the use of the flu-
orides, is the remarkable fluidity which
they give to the heated mass; thereby reu-
dering the separation of the metals more
easy and certain. Their usefulness is great-
est in the case of silicious ores, upon which
they operate in a three-fold manner. First,
by removing, in a gaseous form, much of
the troublesome acid (silica) constituent of
the ore. Second, by the union of the lime
with another portion of the silica to form
silicate of lime, which then passes into
slag, and is rendered still more fusible, as

above stated, by the presence of the fluoride,
which last constitutes the third advantage.

To the fluidity of the slag produced by
fluorides, is due the fact that inexperienced
assayers often obtain better results there-
with, when employed with suitable ores,
than when soda, lime, etc., is used without
fluor spar. The use of fluorides is more
serviceable with some ores than with others;
but the idea that they can extract "five,
ten and twenty times" as much gold as can
be obtained by the use of the ordinary
fluxes, is all moonshine, and the assertion
would never be made by any one who has
a thorough knowledge of metallurgy.

The chief objection to fluor spar, in ex-
tensive metallurgical operations, is its great
cost and the fact that it requires a high
temperature; thus involving additional ex-
pense for fuel.

Large quantities of the product called
"Stevens' flux," is thrown out as "waste,"
at the Natrona Works, above alluded to,
where it is stated some 12,000 tons have ac-
cumulated. The use of this material for a
flux, as we understand it, has been patented
by Mr. Stevens, who proposes to furnish
the same at a given price per ton. There
is no question as to its value; but the only
really valuable ingredient in the same can
be more cheaply obtained in another form—
as fluor spar—which consists of lime 52.57
and fluorine 47.43,—all of which is valuable
in fluxing; while not more than 60 per cent.
of the Stevens flux has any value in the fur-
nace. The 21 per cent. of alumina and
three per cent. of silica has to be fluxed and
got rid of at the expenso of the remaining
fluorine and lime.

In view of the above facts we do not see
what possible value the Natrona product
can have over other well known fluxes. In-
deed, where transportation constitutes a
large item of the cost, as in California, fluor
spar itself,—all of which can be utilized in
the furnace,—must be far preferable to the
Stevens' flux, where half the quantity is
worse than useless.

In working ores of a low grade, it is not
possible that any smelting process, what-
ever, can be made economical.

Great stress appears to be laid upon a re-
port upon this flux made by Prof. Hayes, a
well known metallurgist of Boston, and a
man of undoubted ability. We have read
the Professor's report very carefully, and
cannot find anything therein that contro-
verts the opinion which we have herein
above expressed. His estimate of the flux
is given as follows:

My trials covered its action on the sili-
cious, aluminous, calcareous rocks, and on
sulphureted ores with compound rocks;
and, in all these applications, the minerals
were perfectly melted into thin, generally
glass-like masses, and the metal, or regu-
lus, separated cleanly from the ore.

Indeed, when I used the most expensive
fluxes in the laboratory, the separation of
the metal was no more perfect than when the
ore mixed with this flux was exposed under
like conditions. * * *

[As a fair inference, then, the reverse must
also be true that no better result could be
obtained by the Stevens' flux than by the
most expensive fluxes in the laboratory,
which are the fluorides, as we have already
stated.]

From the trials made, and the well known
character of fluoride of calcium, it is safe
to conclude that in certain proportions, with
or without common salt, this flux may be
usefully applied in reducing any ores or
any wasted mine products. Its special ap-
plication will be doubtless in cases of re-
fractory gold and silver ores containing
sulphides and other compounds of the com-
mon metals, which it reduces to regulus, or
pure metal directly, when sufficient heat has
been applied. When ores containing lead,
silver and gold are fluxed with it, the lead
in mixture with the silver and gold is readily
obtained, every trace of the precious metals
being removed from the ore. In this con-
nection, this flux belongs with the best
known fluxes which can be obtained, re-
gardless of cost. * * *

The experiments demonstrated that this
flux may be applied in the large way, for

reducing ores directly, in furnaces of a
proper form. * * *

It was also proved that the sulphureted
ores afforded sulphureted products, and,
when precious metals were present, these
were held in the impure regulus. It be-
comes necessary, therefore, to roast such ores
before smelting them with this flux, in order to
obtain metallic alloys or rich regulus.

The Professor adds: "It will be safer,
in all cases of the reduction of gold ores, to
insure the presence of some base metal to
form an alloy. In other words, this flux
must be used like any other—the sulphu-
reted ores must be roasted, and free gold
must be collected by the aid of lead or its
compounds, which necessarily involves cupel-
lation, or some other expensive operation
for the final process. This statement is very
far from sustaining the extraordinary claims
put forth in the Stevens' Flux Company's
Circular, or in the report from the *Boston
Post*, alluded to in the former part of this
article. In conclusion, we would express the
opinion that Col. Stevens is just as far from
having found a panacea for the extraction of
gold as have been the hundreds of other
new process-men who have preceded him.

SINGULAR FACT.—We have been informed
by one of the proprietors of the claim known
as the Wisconsin claim, situated in Placer
county, near Colfax, that about once in
every three months they are compelled to
excavate their main tunnel about one foot.
It seems that the tunnel is dug through a
talcoose substance, which, as soon as the air
and light is let in upon it, begins to rise up
or swell so much as to in many instances
crush the supporting timbers. What is
most singular, it does not seem to close up
from the sides or top of the tunnel, but only
rises up from the bottom. The class of
stone called talc, or yellowstone, which is
a kind of mineral magnesia, will expand
when put through a heating process; but
we have never heard of any kind of earth or
stone expanding to the above degree, by
either heating or by any other process what-
ever. This is a subject for the investiga-
tion of geologists and scientific men, and we
generously leave the matter with them for
their own conclusions in regard to the same.
Sacramento Record.

The above phenomenon is very easily ex-
plained, and is quite common in all dis-
tricts where the "bed-rock" is of a mobile or
plastic consistency—like soft, decomposed
granite, or soft slate, of the description al-
luded to by the *Record*. The filling up of
tunnels in such places, is caused by the
weight of the superincumbent mass of earth
forcing the plastic material below the floor
of the tunnel, into the cavity formed by the
excavation; just as when two pieces of
plank are placed parallel in soft clay, a few
inches apart, the clay will gradually rise up
between them, in consequence of the pres-
sure exerted by the planks upon the yielding
mass. The only remedy is to secure the
bottom of the tunnel in the same manner as
the top and sides; but with stouter lining.

J. ROSS BROWN'S SUCCESSOR.—We clip
the following from the *American Journal of
Mining*, of April 25th: "In reply to many
letters of inquiry, we would say that Mr.
Rossiter W. Raymond, lately appointed
Commissioner of Mining Statistics, is still,
and will continue to be, the editor of the
American Journal of Mining, and may be
addressed at the editorial rooms. Mr. Ray-
mond intends to sail for San Francisco on
the 9th of May, after which his address will
be in that city, care of J. W. Raymond,
Esq., but letters sent to this office will be
regularly forwarded to him."

REBELLIOUS ORES.—Among our new ad-
vertisers, this week, appears one from
Messrs. R. Taylor & Co., which will to many
prove a most agreeable one, as we are in-
formed that these gentlemen purpose com-
pleting arrangements having for their ob-
ject the reduction, in California, of those
descriptions of ores commonly denomina-
ted as rebellious ores, and thus avoid for
the future their shipment to Europe for
their reduction.

CONTINENTAL Life Insurance Company,

Interesting California Inventions.

Mr. D. H. Quinn of Sacramento, has furnished us with a description of several interesting inventions recently made by Dr. Thomas of that city. The first is a "Self-Priming Pump," which has all its valves under water, and is described as most complete and simple in its action.

The second invention described by our correspondent, is a "Submerged Furnace" for heating water and generating steam. This furnace can be placed in a tub, or barrel, or used for heating a steam table by the furnace fire. It heats the water upon its outside, and generates steam by the water passing through a coiled pipe placed within the fire of the furnace. It is economical in its use of fuel, of portable size, and appears to be the most effectual apparatus of the kind ever invented, for the purposes for which it is intended. Both these inventions have been patented.

The Doctor has also filed a caveat, and prepared the drawings and specifications of a "Self-Heat Regulating and Self-Attending Cooking Stove," in which the cooking is done chiefly by steam heat. The invention consists of a cylinder with horizontal and perpendicular cylinder ovens therein, all made perfectly steam tight; the superheated steam on the inside of the cylinder and around the ovens is kept at a given temperature by the heat regulator, and all the different dishes of food are cooked in steam-tight vessels, in such a manner as to retain all the aroma of the food, and thereby preventing any odor rising from the stove during the time of cooking. All the vessels containing the food can be highly polished, and will retain their polish during the time of cooking. The vessels in which the cooking is done, can be taken from the oven and be placed on the table to keep the food hot, and would be an ornament thereon. Each dish can be regulated to the minute of time in cooking, as well as the desired degree of heat; for the arrangements are such that there is a clock attached to the stove, to place each dish in the oven at its proper time. For instance, if you wish to have your dinner at 12 o'clock, you will first arrange all the different dishes in their steam-tight vessels, and place the same on trays in front of their respective ovens, then wind up the clock-weight to its proper place, fasten the pendulum of the clock to the lever of the heat regulator, and start the fire in the stove. When the steam in the cylinder is heated to the given degree, the regulator will raise the lever, disconnect the pendulum and start the clock, and as the clock-weight is running down, it comes in contact with the springs that place the dishes in their respective ovens at the given time, to have them all properly cooked at 12 o'clock. And farther, when all is cooked, the clock-weight touches another spring, which rings an alarm bell, closes the stove drafts, opens the oven doors and drafts, to cool the cylinder to a degree sufficient to keep all the dishes warm until called for at dinner.

This invention can also be used for generating steam for power, and can be kept at any given degree of heat, in a uniform manner, with a large saving of fuel, and with no danger of explosion. It may be employed to keep vats of wine at the proper degree of heat, to ripen the same in the shortest space of time. The above machines are on exhibition at the Doctor's office, where all who wish, can see them. The Doctor has made experiments sufficient to prove that he can accomplish what he states, and he will commence the manufacture of these stoves as soon as he has obtained a patent on this invention.

HENDY'S LATEST IMPROVED PATENT SELF-DISCHARGING SULPHURETS CONCENTRATOR.

FOR GOLD AND SILVER ORES,

With Revolving Stirrers and Rotary Distributor.

This machine is designed for saving finely divided Quicksilver, Amalgam and Gold from the sands, and for concentrating and saving the Sulphurets. Any person of ordinary experience with Quartz Mills can readily fit them up and run them.

Those in want of Concentrators would do well to visit some of the quartz mills that have Hendy's Patent Concentrators in use, and satisfy themselves before purchasing other Concentrators or pretended merit. **THEY ARE WARRANTED TO WORK SATISFACTORILY.**

Directions for Operating Hendy's Concentrators:

- The sulphurets are drawn off while the Concentrator is in motion, in the following manner:
FIRST—In setting up, set the pan, A, level by the inner rim, near its center.
SECOND—While in operation, keep the Pan, A, about half full of sulphurets. [See Figure 2, marked S]
THIRD—Open the gate, E, sufficiently to discharge the sulphurets as they accumulate over the amount above mentioned.
FOURTH—The crank shaft to make 200 to 220 revolutions per minute.

References:

Reference is made to the following mills, which have HENDY'S CONCENTRATORS in use:

EMPIRE MILL. (8 Concentrators).....	Grass Valley, Nevada County.
NORTH STAR M. & M. CO. (8 Concentrators).....	Grass Valley, Nevada County.
NORRIDGEWOOD MILL. (2 Concentrators).....	Grass Valley, Nevada County.
VALENTINE & CO. Commercial Mill (3 Concentrators).....	Nevada County.
HUMBOLDT CANAL CO. (1 Concentrator).....	Humboldt County, Nevada.
ROBINSON & McALLISTER M & M. CO. (3 Concentrators).....	Hunter's Valley, Mariposa County.
PLYMOUTH ROCK MILL CO. (2 Concentrators).....	Calaveras County.
MIDAS MILL CO. (4 Concentrators).....	Virginia, Montana.
GOULD & CURRY G. & S. M. CO. (4 Concentrators).....	Virginia City, Nevada.
VULTURE CO. (8 Concentrators).....	Prescott, Arizona.
NOYES & CO'S MILL. (2 Concentrators).....	Prescott, Arizona.
LUCY MINING CO. (3 Concentrators).....	Owyhee District, Idaho.
MOREY & SPERRY (1 Concentrator).....	New York.
GUADALUPE & SACRAMENTO G. & S. M. CO.....	Sinaloa, Mexico.
EL TASTE CO. (2 Concentrators).....	Sonora, Mexico.
B. F. BROWN (1 Concentrator).....	Melbourne, Australia.
JAMES HENTY & CO. (1 Concentrator).....	Melbourne, Australia.

And in use in many other parts of this coast.

The following give additional proof of the increasing popularity of the machine:

SAN FRANCISCO, October 10th, 1867.

J. HENDY, Esq.—Dear Sir:—To your request for an expression, in writing, of my opinion in regard to the merits of your Concentrator, I reply, that I consider it the best machine for saving quicksilver and amalgam, and for concentrating sulphurets, that I have ever used, or seen used. I may add, that I could give you no stronger proof of this than to order, as I did, six more of them, after a trial of one for several months. I shall take pleasure in showing the machine in operation to any one interested, who will call at the mill of the Empire Company, in Grass Valley. Yours,

S. W. LEE, Supt.

NORTH STAR MINE, Grass Valley, Feb. 26, 1868.

J. HENDY, Esq.—Dear Sir:—In answer to your request, I give my opinion in regard to the eight Concentrators we have at work. We have had one at work on blanket washings for the past three months, and it has proved highly satisfactory in saving sulphurets and amalgam, that in past years we have been losing. Of the other seven, six are taking the pulp from the batteries, and the remaining one concentrating from the six, which, when thus reconcentrated, yield 95 per cent. of pure sulphurets. Respectfully, etc.

W. H. RODDA, Supt.

SUPERINTENDENT'S OFFICE, GOULD & CURRY S. M. Co.,
VIRGINIA CITY, Nev., Sept. 17, 1867.

JOSHUA HENDY, Esq., San Francisco:—Dear Sir:—According to the terms under which I secured from you four (4) of your Concentrators, namely—that they were to be paid for only after a thorough trial had demonstrated their value—I desire to inform you that I have tried them, and have found them to work very satisfactorily, and that they will now be accepted by the Company. You will please present the bill for said Concentrators, say \$1,200, at the office of the Gould & Curry Company in San Francisco. Yours, very truly,

LOUIS JANIN, Jr.

The bill was presented in accordance with the above request, and duly paid.

Four Concentrators have been forwarded to the Vulture mine, in Arizona, which makes eight for that mill. The additional order for four machines was made after a thorough trial, which proved their superiority over all others. [See Mining and Scientific Press of Dec. 14th.]

CAUTION.

All of HENDY'S PATENT CONCENTRATORS are marked thus:

"J. HENDY, Patented February 27th and April 17th, 1866."

California Pioneer Fuse

MANUFACTURING COMPANY,

MANUFACTURERS OF

HOSE AND TAPE FUSE,

A New and Superior Article for Blasting in
very wet ground, or under water.

Great difficulty has heretofore been experienced by min-
ers, and others in the use of Fuse, which has been subjected
to deterioration from exposure to dampness during trans-
portation, or during the great length of time which has
passed between its manufacture and use. In addition to
great painstaking in the manufacture of the California-
made Fuse, the above and many similar objections are en-
tirely obviated, and the operator can always depend with
certainty upon the burning of his fuse.

It is often the case that extra lengths are required, as ex-
ploding tunnels, etc., longer than is furnished in the im-
ported article. Fuse of every desired length or size can
be made to special order, at the above manufactory.

scription.Hydraulic Pipe supplied at reasonable rates. In or-
dering, give the quantity of water to be supplied, height of
the fall, and total length of pipe, so as to enable the firm to
determine the diameter of the pipe and thickness of iron to
be used.Repairs.—Boilers, Smoke Stacks, Pipes, etc., put in re-
pair with promptness.To Boiler Makers and Machinists in the In-
terior.—The firm is prepared to furnish estimates of
Boilers, supply new Heads, drilled and punched, and attend
to the selection and forwarding of Iron for Boilers, Pipes
and other purposes.Plans, Drawings and Specifications.—The firm
is prepared to make out Plans and Specifications, receive
estimates, and superintend the Erection of any Machinery
that may be entrusted to their care.To Inventors.—The firm is prepared to assist in de-
veloping the plans of those who have the ideas, but not the
practical experience necessary to put the same in form, by
making Drawings of their inventions, giving them the bene-
fit of their practical knowledge in the construction of Ma-
chinery, and attending to the manufacture and introduc-
tion of their inventions. 13v16f

Pacific Iron Works.

First and Fremont Streets,
SAN FRANCISCO.Having been established since 1851, we have accumulated
a very large variety of Gear and other Patterns, which,
with our superior tools and appliances, give us facilities for
doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine
use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

Including High and Low Mortars, for wet or dry crushing;
Furnace Irons for Roasting Ores; Feeders, Barrels;
Varney's and Wheeler's Amalgamating Pans
and Settlers; Stamp Shoes and Dies of
best White Iron; Russia Iron
Screens, etc., etc.Flour Mill, Saw Mill and Sugar Mill Work in every variety;
Pumping and Hoisting Machinery; Hansbrow's
Patent Challenge Pump, for Domestic,
Ship and Mining use—the most
approved and successful
Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Vari-
able Cut-off Engines," of which we are the sole manufac-
turers on the Pacific Coast, under license from the Wood-
ruff & Beach Co., Hartford, Ct. As a simple, effective, fuel
saving, first-class Engine, this is, without doubt, the best
Engine made in the United States.
Orders promptly attended to. Prices as low as possible
for first class work, and we intend to do no other.

The American Spring Bed.

THIS BED, NOW SO POPULAR IN THE EASTERN
and Western States, was patented August, 1856. For
practical utility, comfort and durability, it is unsurpassed.
It is easily applied to any bedstead. It is portable, and
not liable to get out of order. The price is about one-fourth that
of the spring mattress. It combines elegance with cheap-
ness and comfort. Call on the Mechanics' Institute
Building, No. 28 Post street, San Francisco. 5v16-3mIMPROVEMENT IN GAS ILLUMINATION.—It
was some time since proposed to substitute
for the ordinary gas light the more intense
Drummond light, which is produced by in-
troducing a piece of quicklime or magne-
sia into the flame of a mixture of oxygen
and street gas. The effects thus obtained
surpass those of the latter so considerably
that most persons have felt that all that was
required to permit of this principle of light-
ing was the introduction of a cheap process
of obtaining oxygen gas. Mr. Bourbouze,
however, has now constructed an apparatus
which does away entirely with the prepara-
tion of oxygen, affording at the same time
a great economy in regard to the quantity
of gas employed. The former is substituted
by atmospheric air, the practical arrange-
ment for effecting the combustion being the
following: The gases are admitted into one
common tube; from thence they pass
through a sheet of metal, perforated with a
great many holes, in order to be divided
into many small jets; these are delivered
through a gauze of platinum wire, when
they are lighted. The metal, in being
heated, soon becomes red, then white, and
thus diffuses a dazzling light.—London Min-
ing Journal.DR. T. LAMBERT recently gave an inter-
esting lecture on Biometry or Measure of
Life. He stated that long trunks in the
human body, and hazel eyes are indications
of longevity and that a certain depth of the
orifice of the ear will also indicate a short or
long life. Brown eyes belong to the bil-
ious and blue eyes to the sanguine tempera-
ments; he would add other two, viz., the cap-
illary and lymphatic temperaments, and
classify the mechanism of the human body
as blood making and mental. He remarked
that the lives of those accustomed to se-
dentary employment were short, whereas
blacksmiths and machinists generally lived
to old age. Where parents have lived to a
ripe old age—their descendants would in-
herit their longevity. In Zurich there are
few persons who live after sixty years,
whereas in Berne, Switzerland, the inhabi-
tants were remarkable for longevity."DEAD-OIL" AS FUEL.—We find the fol-
lowing in the London Quarterly Journal of
Science for April: "At the works of Messrs.
Miller & Co., Glasgow, the 'dead-oils'
from the gas works,—which are a waste
material for which the gas manufacturer is
glad to get a penny a gallon,—are burnt
under two steam boilers with great advan-
tage and economy. In the morning the fire
is lighted with coke or coal, and the fire-
bricks heated. Then the 'dead-oil,' which
flows down a long-necked funnel, is forced,
by a small jet of steam, into the furnace.
It ignites at once, producing an intense
heat, which is maintained all day without
the addition of any other fuel. Some ex-
periments were about to be made with these
oils in the locomotives for the coal trains of
the Caledonian Railway.THINKS HE MAY GET IT.—The American
Journal of Mining says: A. W. Putnam,
who has been searching for some time past,
under the guidance of a Boston spiritualist,
for buried Spanish treasures at Scitico, Ct.,
thinks he has now fairly reached the walls
of the enchanted cave. At a point twenty-
five feet from the entrance, the witch hazel
turned to three points, and he has gone to
Boston for a medium to visit the spot and
tell what it means. At a previous visit to
Boston, he left orders with his workmen to
continue until directly behind a certain
stump, and then stop, awaiting his return.
At the time of their stopping, he was sum-
moned by a medium, who told him the fact
in detail, and sent him back, as the spirits
couldn't let the work wait.THE SUEZ CANAL.—The Duke of St. Al-
bans, who has recently visited the Isthmus,
writes to the London Times upon the sub-
ject,—closing thus: "The canal now enters
the Mediterranean and forms the harbor of
Port Said. Eight years since, there was a
narrow strip of sand between the sea and
lagoon, without a hut on it. I now see a
town of 10,000 inhabitants—a rapidly in-
creasing Venice—and a port full of large
shipping. I do not believe there is a single
person on the Isthmus who is not firmly
convinced that the undertaking will suc-
ceed. They see in a marvelously short
space of time a population of 20,000 Euro-
peans alone, created in the middle of the
desert, and supplied with necessaries and
luxuries. They see a great port spring up
under their very eyes, as if by magic, and
the object of their enterprise two-thirds
completed.GERMAN CHARACTERS TO BE DROPPED.—
The Germans are beginning to print their
books in Roman type. It is found much
clearer and less trying to the eyes. Ophthal-
mia killed half the poor compositors before
they had been ten years at the business.

Several Ways of Dissolving India Rubber.

In Oil of Turpentine.—The India rubber, after being cut into small pieces, is put into a glass vessel with from six to twelve times its weight of oil of turpentine. The retort is closed with a cork, through which a small hole has been made, and then heated over a coal fire to 60 or 65° F. It is sometimes necessary to stir it.

In Linseed, Hemp, or Nut-oil.—These oils are heated over a gentle coal fire to the boiling point, with or without some of the known drying substances. After ten minutes boiling, the finely-cut India rubber is introduced, and constantly stirred until everything is dissolved. To effect a quick drying of the solution, sulphate of zinc, heated until it has given up all its water of crystallization, is ground fine with oil of turpentine, and about half an ounce of it added for each pound of the India rubber solution.

In Olive Oil, or Fish Oil.—For application to different leather manufactures, three ounces of India rubber is dissolved in sixteen ounces of olive or fish oil, and sixteen ounces of a raw siccative oil is to be added. The boiling must not be continued any longer than is absolutely necessary, and no other drying materials are to be added.

To dissolve India rubber for the purpose of making leather soft and pliable, it is best to heat equal parts of India rubber and hog's lard, over a gentle coal fire in a covered vessel. From time to time it must be examined, in order to ascertain whether the India rubber is completely dissolved. After that, it is to be diluted with train oil, and the solution applied while warm to the leather. But if a solution is required to render thin fabrics water-proof, lard, train oil, and other common fat oils should be avoided; but the India rubber should be treated with oil of turpentine, or coal oil, until it is soft and swollen, and then dissolved in a varnish of linseed oil.

QUICKSILVER IN SAN MATEO COUNTY.—

The San Mateo Gazette of the 16th says: Considerable excitement was caused in Redwood City, last Tuesday, by the report that a quicksilver mine of surpassing richness had been discovered upon the ranch of Owen McGarvey, some three miles from Redwood City, on the Searsville road. Mr. McGarvey has a contract for grading and putting rock upon Main street, from the county road, near the distillery, to the railroad crossing in the eastern addition to Redwood City, and has been hauling the rock from a ledge on his ranch. The rock is hauled in large boulders as it is quarried out, and then broken up with sledge hammers upon the road, and it was while one of the men was engaged in pounding this rock to pieces, that he discovered quicksilver oozing out and trickling down among the loose rock. Some quarter of an ounce or more of the liquid quicksilver was gathered up in an old cover to a tin can and brought to this office, together with several pieces of rock, in which particles of quicksilver are visible. The rock before us does not have that reddish appearance peculiar to all cinnabar which we have seen before, but that it contains a large per cent. of quicksilver there can be no doubt. There is a mountain of rock where this came from, but the extent of the cinnabar is yet unknown. Steps will be taken to thoroughly prospect the mine without delay. H. F. Williams & Co., of San Francisco, recently negotiated for the purchase of McGarvey's ranch for \$30,000, but backed out of the trade for some reason, and, as we have been informed, forfeited \$1,000 put up as a forfeit in the first instance. Thirty thousand dollars will hardly buy Mac out about this time, we imagine.

RAILROAD BRIDGE AT OMAHA.—The Pacific Railroad Company's bridge across the Missouri river at Omaha, is to be one of the most substantial and expensive structures in this country. The bottom cord will be 55 feet above high water mark, thus avoiding the necessity of a draw. The truss is to be constructed of iron, supported by substantial stone abutments and piers. The estimated cost is \$2,500,000, and its completion, it is thought, will require two years.

Our Patent Agency.

THE PATENT AGENCY OF THE MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of Letters Patent from the United States and foreign Governments cannot be over-rated, and the Proprietors of the Press, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and reasonable agency upon this coast.

THE GOLDEN ERA.

Founded in 1852, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent.

THE GOLDEN ERA

Is the most universally popular of all the Weekly Journals. It presents forty-eight columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected matter. It is a welcome guest in Cottage and Cabin; the favorite at the fireside in city and country; the most useful, agreeable and altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe and elsewhere. Every household in the mountains and valleys, the cities, towns and mining camps of California, and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor. Inspired with the genius of the age, it is progressive, and aims not so much at distinction as a newspaper, as at honorable success in its capacity of a great Moralizing and Improving Influence. Exercising a positive power for good, and yielding a permanent influence, many able and eminent writers choose its columns as a means of communicating with the public. No effort will be spared to make it a thoroughly California newspaper, and worthy of the support of all classes of our citizens.

MOSHEIMER'S

Pioneer Mining School,

ASSAY OFFICE

—AND—

Metallurgical Works,

SAN FRANCISCO.

Having established the first Practical Mining and Metallurgical School in the United States, I would call the attention of gentlemen who may wish to obtain a practical knowledge of Chemistry, Metallurgy, etc., to the fact that I am now prepared to teach the following branches:

- 1.—Assaying of Ores, Metals, and other Mineral Substances.
- 2.—Metallurgy of Gold, Silver, Copper, Lead, etc., by Smelting, Amalgamating, Lixivation, etc.
- 3.—Gold Extraction, by Chlorine Gas; also, a modified process of the same, which is cheaper and quicker than the processes usually employed.
- 4.—Concentration.—Dressing of Ores.
- 5.—Construction of Furnaces, in which any kind of fuel may be used for Smelting, Roasting, etc., as well as the erection of any Machinery or Apparatus required in Metallurgy and Technology.
- 6.—Technology, or Chemistry as applied to any special branch of Manufacturing.

By my Practical Mode of Teaching, any person of ordinary ability can learn to Assay Ores in three lessons, and the working of all the ordinary and refractory ores in a few weeks.

Gentlemen of almost every profession, who, within the last two years have graduated at my establishment, will bear testimony that from my instructions they have learned more in a few weeks than they ever expected to learn.

My charges are from \$50 to \$200.

Ores of every description assayed and worked

THE BEST IN AMERICA.

The Mining and Scientific Press,

Is the Largest and Best MINING AND MECHANICAL Newspaper Issued in the United States.

DEWEY & CO.,

Patent Agents, Publishers, Book and Job Printers, 505 Clay Street, San Francisco.

THE MINING AND SCIENTIFIC PRESS is published every Saturday. Each issue comprises sixteen pages (64 columns), and furnishes more valuable reading matter than any other weekly journal in California.

To the practical mechanic, metallurgist, prospector, millman, mine holder or worker, it is worth many times its subscription price. Its files contain a record of the improvements in mining machinery, the progress and development of the mines, and all new methods and processes for working and

SAVING PRECIOUS METALS.

All progressive information, in fact, transpiring with the times—which cannot be obtained from books.

The MINING AND SCIENTIFIC PRESS is now in its SIXTY-THIRD VOLUME, and enjoys a large circulation. It received the following hearty endorsement of the California Miners' State Convention, held at Sacramento, January 17th, 1886:

RESOLVED, That we regard a mining paper or journal of great importance to the mining interests of California, and recommend the MINING AND SCIENTIFIC PRESS, of San Francisco, to the consideration and support of the miners of the Pacific coast.

Terms of Subscription.—One year, \$5; six months, \$3—in advance. Send for sample copies. Remittances may be made by mail at our risk, if parties sending will register their letters, or send money order.

AS AN ADVERTISING MEDIUM throughout the whole Pacific States and Territories, the Press is unsurpassed. Rates moderate.

THE LATEST IMPROVEMENT
In Dentistry.

PATENTED DECEMBER 30, 1867, by DR.
G. W. COOL. The right of San Francisco
reserved for his own use. The nature of
his improvement consists in lining the en-
tire concave surface with fine gold; it makes the plate
twice as strong and one-third thinner than the common
vulcanite plate. This work has given satisfaction in every
case. Please call at No. 14 Third street, near Market, and
see specimens. All work warranted as fine as the spec-
imens. Prices reasonable. 21v-63m

SURE CURE.

I PROMISE TO CURE RHEUMATISM, NEURALGIA,
Gout in the Feet or Ankles, Chills and Fevers, Dyspep-
sia, Piles, Mange, Bone Felon, and all kinds of Sores, in men
or animals, and no matter of how long standing, whether
inherited or otherwise. Also, Heart Disease, Sore Eyes,
Sore Throat, Diphtheria, Scrofula and Salt Rheum. Secret
Diseases of all kinds cured. DR. JAMES BROWN, No. 340

Those marked with an asterisk () are advertised in this Journal.

FIRST STREET IMPROVEMENTS.—P. Donahue has announced his intention to erect a block of stores on First street, similar to those composing the Oriental Block, as soon as his lease to the present occupants of the Union Foundry expires, which will be in about two years. It cannot be long before the substantial improvements, which for some time past have been steadily advancing westward towards and upon Market street, must cross that great thoroughfare, and continue their way along the city front towards Rincon Point. First street is in the direct line of such improvements, and will doubtless be the first beyond Market to undergo transformation. The announcement of Mr. Donahue will doubtless encourage others, nearer to Market, to undertake similar improvements, perhaps to anticipate him. The time cannot be far distant when all our foundrymen will find it to their advantage to take up the line of march for some point near the water front beyond Mission Bay. That kind of business requires too much ground room to remain long in a locality where land is so rapidly increasing in value as that on First street.

THE COLORADO, which sails for Japan on Wednesday next, has been thoroughly overhauled, repaired, repainted, and put in the best order for comfort and safety. She will take out a new shaft to replace the present one on the Great Republic, which was broken on her last trip out. The Pacific Foundry is fitting up a spring bearing for the shaft, and heavy wrought iron collars and keys for the flanges. A duplicate crank will also be taken out, to be used in case it is found impossible to remove the one now on the broken shaft, and to provide against any other possible chance of its being unserviceable.

TO PERSONS NEEDING SPECTACLES.—Those glasses are best suited to the sight which enable the wearer to read print to the best advantage, at the distance of about fourteen inches from the face. If the book or paper be held nearer than this, it indicates a glass of too great a power; if farther, then one of too weak a power. So says C. Muller, at the spectacle emporium, 205 Montgomery street, in this city.

To Bremen and the German States (marked via Bremen and Hamburg line), three cents per copy, prepaid. Single copies to any address in the United States, two cents.

New Mining Advertisements.

Globe Gold and Silver Mining Company.—Location of Works: Monitor District, Alpine County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-fifth day of May, 1868, an assessment of two dollars per share was levied upon the capital stock of said Company, payable immediately in United States gold coin, to I. S. Fowlers, Silver Mountain, J. Winchester, Monitor, or to the Secretary in San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the thirtieth (30th) day of June, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the eighteenth day of July, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

V. B. POST, Secretary.
Office, Union street, south side, one door east of Montgomery street. my30

Lyon Mill and Mining Company, Kelsey District, El Dorado County, California.

Notice.—There are delinquent, upon the following described stock, on account of assessment levied on the twenty-first day of April, 1868, the several amounts set opposite the names of the respective shareholders as follows:

Names	No. Certificate.	No. Shares.	Amount.
W. N. Wade.....	68	100	\$500.00
O. L. Wagon.....	18	3	15.00
I. S. Fowlers.....	61	10	50.00
A. M. Stetson.....	64 and 65	10	50.00
G. W. Clark.....	73	1	5.00
Wm Smith.....	74	5	25.00
Mrs Henry Van Ness.....	75	4	20.00

And in accordance with law, and an order of the Board of Trustees, made on the twenty-first day of April, 1868, so many shares of each parcel of said stock as may be necessary will be sold at public auction, by Olney & Co., auctioneers, 426 Montgomery street, San Francisco, Cal., on the fifteenth (15th) day of June, 1868, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

J. M. BUFFINGTON, Secretary.
Office, Room 37 New Merchants' Exchange, California street, San Francisco. my30

Office Providence Gold and Silver Mining Company.—The Annual Meeting of the stockholders of the above named Company, for the purpose of electing Trustees and transacting other necessary business, will be held at the office of the Company, No. 37 New Merchants' Exchange, California street, San Francisco, on the TWENTIETH day of June, 1868, at 5 o'clock, P. M., of that day.

F. P. FOLSOM, President.
J. M. BUFFINGTON, Secretary.
San Francisco, May 28, 1868. my30

Mining Notices—Continued.

Adriatic Gold and Silver Mining Company.
Flowers District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twelfth day of May, 1868, an assessment of one dollar (\$1) per share was levied upon each and every share of the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at his office, No. 411 California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the thirtieth (30th) day of June, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the fifteenth day of July, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

PAUL NEUMANN, Secretary.
Office, No. 411 California street. my23

Adella Gold Mining Company, Rock Creek, Sierra County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the thirtieth day of May, 1868, an assessment of one dollar (\$1) per share was levied upon the capital stock of said Company, payable immediately in United States gold coin, to the Secretary, at his office, No. 318 California street, up stairs, San Francisco.

Any stock upon which said assessment shall remain unpaid on the thirtieth (30th) day of June, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the sixth day of July, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOHN F. LOHSE, Secretary.
Office, 318 California street, up stairs, San Francisco. my16

The Flora Glazier Quartz Mining Company.
Location of Works: Plumas County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the eighth day of May, 1868, an assessment of fifty (50) cents per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at his office, No. 606 Battery street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the twenty-fourth day of June, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the ninth day of July, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. W. JOHNSON, Secretary.
Office, No. 606 Battery street, San Francisco. my23

Great Central Mining Company.—Location of Works: Yuma County, Arizona Territory.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fourteenth day of May, 1868, an assessment of one dollar per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at his office, No. 635 Kearny street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the fifteenth day of June, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the seventh day of July, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

O. D. SQUIRE, Secretary.
Office, No. 302 Montgomery street, San Francisco. my16

Hope Gravel Mining Company. Location of Works and Property: Grass Valley, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the seventh day of May, 1868, an assessment (No. 23) of one dollar (\$1) per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at his office, No. 635 Kearny street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the fifteenth day of June, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the eighth day of July, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

DAVID WILDER, Secretary.
Office, No. 533 Kearny street, corner of Sacramento, San Francisco, California. Office hours from 12 to 2 P. M. my3

Illegal Supplemental Advertising.—It would be well for Mining Companies, whose advertisements are repeatedly appearing in the Supplements of daily papers, to inquire into the legality of that class of advertising.

By MAIL.—The Mining and Scientific Press will be sent by mail to any part of the civilized world. In case of removal subscribers have only to inform us of the post office address of their old and new location, and the paper will be sent accordingly.

I. X. L. Gold and Silver Mining Company.—Location of Mine: Silver Mountain District, Alpine County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fourth (4th) day of May, 1868, an assessment of one dollar and fifty cents (\$1.50) per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at his office, Pioneer Hall, (up stairs) Montgomery street, near Jackson, San Francisco.

Any stock upon which said assessment shall remain unpaid on the thirtieth (30th) day of June, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the first day of July, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. CROWNSHIELD, Secretary.
Office, Pioneer Hall, Montgomery street, up stairs. my9

Nuestra Senora de Guadalupe Silver Mining Company.—Location of Works: Tayoltita, San Dimas District, Durango, Mexico.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 31) levied on the twenty-seventh day of March, 1868, the several amounts set opposite the names of the respective shareholders, as follows:

Names	No. Certificate.	No. Shares.	Amount.
M. Eyer.....	57	5	\$7.50

M., for the election of Trustees and the transaction of such other business as may be presented.

T. W. COLBURN, Secretary.
Office, room No. 10 second floor of No. 402 Montgomery street, San Francisco. my19

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the

PACIFIC FOUNDRY,
San Francisco.

SUPERIOR CUT-OFF ENGINES.

We desire to call the attention of Engineers, Manufacturers, and Millmen, to the celebrated

Hartford Engine,

With Wright's Patent Variable Cut-off, which we are now manufacturing under a license from the Woodruff & Beach Iron Work Co., Hartford, Ct. To parties wishing a First-class

Fuel-Saving Engine,

Simple and durable in construction, this Engine is offered to the belief that it is superior to any other manufactured. It enjoys the very highest reputation in the Atlantic States, where it is well known; over 300 of them having been built by the Woodruff & Beach Company, and being now in successful operation.

Pattern and Model Maker,

Has recently opened a shop at No. 28 Fremont street, over Clerc & Co's Foundry, where he is prepared to execute with neatness and dispatch, all kinds of models in wood, brass or iron, and patterns of every description. Jigs-Saws of any size or strength, of a new and superior quality, built to order. Also, an ingenious machine for Polishing Shirts, well adapted for Laundries.

Terms reasonable for all classes of work, and regulated by tho style required. 11v16-3m

OIL STOVES!

MORRILL'S

Petroleum and Universal Oil Stoves

Have proved themselves a superior substitute for Wood and Coal Stoves, in that they work quicker, are neater, bako and broil better, are MORE ECONOMICAL generally. They are portable, can be used in any room, with or without chimney, as they cut no smoke, soot or ashes. There are nine different sizes, designed for barbers, dentists, and other mechanical purposes—as well as for cooking. They are perfectly safe.

I now offer a reward of \$100 for every Petroleum Stove exploded by Naphtha delivered at my store, 18 Geary street, where they are for sale by

M. B. BULLARD,

Proprietor of Petroleum Stove for California, and Agent for Universal Oil Stoves for Pacific Coast.

N. B.—Petroleum Stoves burn Naphtha converted into a gas. Universal Oil Stoves burn Naphtha, Benzine, or Coal Oil, with non-illuminating flame and light on a wick as easy as a lamp. 21v16-3m

Brodie's Patented Improvements

FOR THE TREATMENT OF

Gold and Silver Ores.

BRODIE'S PATENT IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:

No. 1—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price, \$600.

No. 2—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour. \$850.

No. 3—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour. \$1,200.

These Crushers have been erected at several mines in the State of Nevada, and others in Calaveras, Tuolumne and Mariposa counties, to whom applicants can be referred as being the most efficient, cheapest, and best adapted to the work, and compatible with strength and durability, of any Crusher yet erected.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATOR BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1865.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22, 1866.

H. T. HOLMES.

Economy in Advertising.—The Mining and Scientific Press is the best and most economical mining advertising medium in this city. Our terms are less than one half the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The "Press" contains, proportionally a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

ELECTROTYPING CUTS, ENGRAVINGS, Etc.—Our Job Printing Office is abundantly supplied with elegant engravings, ornaments, and other embellishments to suit the various branches of industry in this State.

A SAFE,
CERTAIN,
AND
Speedy Cure
FOR
NEURALGIA,
AND ALL
NERVOUS
DISEASES.
Its Effects are
Magical.

It is an UNFAILING REMEDY in all cases of Neuralgia Facialis, often effecting a perfect cure in less than twenty-four hours, from the use of no more than two or three PILLS.

No other form of Neuralgia or Nervous Disease has failed to yield to this

WONDERFUL REMEDIAL AGENT.

Even in the severest cases of Chronic Neuralgia and general nervous derangements,—of many years standing,—affecting the entire system, its use for a few days, or a few weeks at the utmost, always affords the most astonishing relief, and very rarely fails to produce a complete and permanent cure.

It contains no drugs or other materials in the slightest degree injurious, even to the most delicate system, and can ALWAYS be used with

PERFECT SAFETY.

It has long been in constant use by many of our most

EMINENT PHYSICIANS,

who give it their unanimous and unqualified approval. Sent by mail on receipt of price, and postage.

AEROLITES.—At the Academy of Sciences M. Dauhree described a meteorite picked up in the Philippine Islands, and supposed to have fallen in the year 1859. Upon analysis, it was found to possess the characteristics common to the majority of aerolites hitherto collected, its density being represented by 3.6. Its constituent parts are magnesia, protoxide of iron, a little oxide of nickel, and a very small quantity of alumina. It has been bequeathed to the Academy by the late Don Casiano de Prado, Inspector-General of the Mines of Spain. Another paper on a similar subject was afterwards presented by MM. Dauhree and St. Munier jointly, in which they gave a minute account of the meteorite that fell at Murcia (Spain) in 1858, and excited much interest at the Great Exhibition last year. The density of this large block, which measures about 16 in. in length, as many in breadth, and 10½ in. in height, is 3.54. It is nearly entire, being all most everywhere covered with the well known crust, which however, is not black in this instance, but ochraceous, a circumstance attributed by the authors to superficial decomposition after its fall. Its mass presents a peculiarity not remarked in any other aerolite—a quantity of minute and very brilliant hyaline crystals. Its texture is very hard, sparks being elicited from it by a smart stroke of the hammer. It contains as much as 20½ per cent. of ferric sulphuret, about 15 per cent. of nickeliferous iron, and some traces of phosphorus; the rest is composed of silica and other minerals.—London Mining Jour. April 11th.

THE MECHANIC ARTS IN CALIFORNIA.

The following is from an editorial in the Stockton Independent of the 23d inst.:

"If California is yet unsung in the finer and more æsthetic arts, she has astounded her older sisters in practical invention as greatly as the world was astonished at them. Her young and sparse population is taking out more patents, annually, than any other State in the Union. Many of them are gems of mechanical utility, adapted to the development of her soil and mines. Several hundred quartz machines have been patented, each, in some particular, being valuable, and many improved processes of mining and metallurgy have been discovered. The sluice and hydraulic mining are Californian. In agriculture, she has invented the best gang plows known, made improvements of great value on farming implements, and is now in course of experiment on a steam plow of a new and novel plan. She applied machinery to building railroads, and manufactures some of the best safe and permutation locks known. Her polished woods are perfection in the cabinet art, and in the photographic art her pictures are exquisite gems. Stockton invention has considerable claims on public attention. Baxter's, and Matteson's gang plows have great merits, which farmers well appreciate. Pumps, windmills, agricultural implements, attachments to sewing machines, gunlocks, labor-saving harvest forks, and many other inventions that escape us at this moment, display the inventive talent of our mechanics,—all of which it is to be hoped will be exhibited at the next Mechanics' State Fair in San Francisco, that their light may not be hid under a bushel."

SCIENCE AND FUN.—A very amusing application of frictional electricity, illustrating science in a toy, has been recently patented by Messrs. Funston and Blockstone, 912 Market street, Philadelphia, in the shape of a small ornamental, shallow box, having for its bottom a plate of looking-glass. Another sheet of common glass forms the cover, and there is a space of perhaps an inch and a half between the two glasses. A variety of figures cut out of paper, or other light substance, are laid upon the looking glass, and on gently rubbing the surface of the upper glass with a handkerchief or a piece of paper, the several figures become electrified, assume the erect position, and dance about at a gait rate, much to the amusement of lookers-on. When not in use the box may be hung up to serve as a mirror. The makers furnish a great variety of forms of these toys, and the prices run from fifty cents upward. Stockholder.

WINDMILL POWER.—Smeaton ascertained that the effective power of a windmill with sails of the best form, and about fifteen and one-half feet radius, with a breeze of thirteen feet per second, is about one horse power.

SALARIES.—Louis Napoleon receives as salary \$14,240 per day; Queen Victoria, \$6,027; Francis Joseph, \$10,950; the King of Prussia, \$8,210, and the President of the United States, \$70.

PRODUCTION OF A FRAGRANT OIL FROM RESIN.—(Probably an essential oil.) Common resin lac, or kanri gum, in a state of powder, is gently heated with somewhat diluted nitric acid for a few hours; the mixture or solution is then evaporated to dryness, or nearly so, and treated with an excess of a strong solution of common soda, caustic potash, or lime in water; the resulting liquid is then transferred to a retort, and distilled. At first the distillate has an odor of garlic, but this gradually gives way to an odor decidedly fragrant. On redistilling the portion last drawn over from concentrated sulphuric acid, a strong aqueous solution of this odorous substance is obtained, the solution itself has a warm aromatic flavor, and the odor assimilates to that of peppermint mixed with lavender. Bichromate of potash with sulphuric acid, also, may be used for the oxidation of the resin employed.—*Chemical News.*

MAKING WHITE LEAD.—A few weeks ago we made a note of the fact that a new process for producing an excellent article of white lead, had been devised by M. A. Giffard; the following is the plan referred to: Granulated metallic lead is placed in a barrel, with one-fourth its weight of water. By a suitable arrangement the barrel and contents are rotated about forty turns per minute, while a continuous current of air is forced through at the same time. After revolving for about two hours almost all the lead will be oxidized, and now a current of carbonic acid is substituted for the air, and the rotation continued for five hours longer, when the true white lead, which constitutes almost the entire contents of the barrel, can be separated by decantation, washed and dried.—*Sci. American.*

EFFECT OF FROST ON LARVÆ.—In a paper addressed to the French Academy, M. Reiser announces that the general belief held by farmers, that a severe frost kills noxious insects and larvæ that grub in the earth, is a fallacy, the only effect of the frost being to drive them still deeper into the earth. He found that while the thermometer stood at 5° Fah., and the ground was covered with snow, the soil at a depth of twenty inches was not influenced by frost, and below this line the larvæ were to be found; descending still further as the cold increases.

ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.

Awarded the First Premium at the Paris Exposition.

ADAPTED
FOR
Smelting,
Foundry,
Mining
and
Steamships.

REQUIRES
Fifty Per Cent.
LESS POWER
Than any Blower
now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver mine; Gridley's Foundry, Gold Hill, Nevada; Aetna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

IMPORTERS AND DEALERS IN

**Agricultural Implements, Portable Steam Engines, Hardware,
RUBBER BELTING, Etc., Etc.,**

Nos. 17 and 19 Front street, San Francisco, and 9, 11, 13 and 15 J street, Sacramento.

Wood & Mann's Portable Steam Engines, 6, 8, 10, 12 and 15 horse power,

With newly invented Water Bottom, which entirely surrounds the fire grate and ash-pit, forming underneath the ash-pit, as on the sides of the furnace, a three or four inch water space, by which additional heating surface is obtained, the accumulation of sediment around the fire-box or furnace is entirely prevented, and renders it perfectly safe to use near any barn, or in any farm-yard, or in any building where a stove would be allowed, as no sparks can possibly escape from the furnace or ash-pit. The sediment has a free passage to the bottom of the fire-box, and can be blown off daily by the blow-off cock underneath the ash-pit, by which means the boilers may be kept clean much longer than under the old system. The great saving in repairs which is effected by the use of these water bottoms, and the constantly increasing demand for them, prove their superiority to any others yet constructed.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

MEETING OF UNIVERSITY REGENTS.—The Board of Regents for the new State University held a preliminary meeting yesterday, at the office of Jackson Temple, in this city. Eight members, only, being present, the Board did not organize, and of course no business was done. The first regular meeting of the Board is called for the 9th of June.

As it by magic comes repose,
Forget thy pain, forget thy woes.

This harmless Remedy stops all pain instantly, and leaves no stain. The tongue cannot mention any physical pain that this Remedy will not remove in five minutes. Whether a frightful Burn, a gripping Colic, or a simple Mosquito bite, the result proves an entire relief from distress at any spot or place where applied. It is perfectly adapted not only for all pain, but also permanently cures the worst Ulcers, Piles, Cancers, or breaking out on any part of the body, and all internal complaints, by an outward application to the parts affected.

MOORE'S PAIN ANNIHILATOR, a standard remedy for Catarrh, Cold in the Head, Inflamed Eyes, etc., sold by all druggists.
G. H. MOORE, Inventor and Sole Proprietor, 612 Market Street, San Francisco, Cal. 21v16-3m

SAVE YOUR TEETH.—Drs. Jessup & Beers, over Tucker's jewelry store, are now making a specialty of filling the fangs of dead Teeth, and building up broken crowns with pure gold—thus restoring them to their original usefulness and beauty. They are also using Nitrous Oxide for the painless extraction of Teeth, when so desired—the only absolutely safe anesthetic ever discovered. In breathing it, it acts as a gentle stimulant, without undue excitement, the sensation produced being truly delightful, the effect upon the lungs healthful, and in its results positively free from all danger. Prepared and administered daily at the Dental Rooms of Messrs. JESSUP & BEERS, corner Montgomery and Sutter streets, San Francisco. 16v16f

DISEASES OF THE EYE.—During a late visit to San Francisco, we fell in with an old acquaintance from this county, Mr. O. W. Purdy, who formerly resided at Forrester City. About two years ago, while under treatment, we saw Mr. Purdy at the office of an oculist in that city, with eyes badly inflamed and the sight entirely lost. We saw him a few months later at another physician's, but his case was scarcely improved, and seemingly hopeless. His eyes have now entirely recovered, so that he goes about his ordinary business. From his own lips we learned that the restoration of his sight was entirely due to Dr. D. R. Morgan, whose office is at No. 627 Sacramento street, between Montgomery and Kearny, who cured him in the short space of eighteen weeks. Mr. Purdy mentioned several remarkable cures which occurred in the practice of Dr. Morgan during the time he was under treatment, among which was that of Mrs. Jane Albert, of Brownsville, Yuba County, and several others. Mrs. Albert had been afflicted with sore eyes from early childhood, and for eleven months previous to treatment she had not been able to discern light, nor had she seen the features of her youngest child, twelve months old. She had heard of the remarkable cure of Leonard P. Eder, of Marysville, and Joseph E. Haskell, of Sacramento, and determined to try Dr. Morgan. The result was that she was able, after ten days, to read ordinary newspaper print. Mr. Purdy was of course greatly rejoiced at the recovery of his sight, after so many trials and failures with different physicians.

The above is clipped from the Mountain Messenger, of February, 1883. 10v16 3m

SCREWED BOOTS.

LUMSDEN'S CALIFORNIA APPARATUS
FOR THE MAKING OF

SCREWED BOOTS.
Patented Feb. 21st, 1869.

With this valuable invention, Boots and Shoes can be made on lasts, with or without being plated, in any style that is required. The State Right, will be disposed of at figures that will afford the purchaser an opportunity to realize a fortune.

For particulars apply to
NICHOLAS LUMSDEN, Inventor.
Nevada House, 51 Stevenson St.,
22v16f San Francisco.

JOHN PERRY,
MANUFACTURER OF
Cocoanut Matting, Rugs, Mats, Etc.
And Cocoanut Fiber for Upholstery.
South side Chestnut street, bet. Polk and Larkin streets,
SAN FRANCISCO.

BY A PROCESS ENTIRELY NEW, THE PROPRIETOR is now manufacturing in quantity sufficient to supply the demands of the trade, a NEW AND SUPERIOR MATERIAL FROM THE FIBER OF THE COCOANUT—the best substitute for curled hair hitherto discovered—for mattresses, chairs, lounges, and all upholstering purposes. The following are some of the advantages which it possesses over all other materials used for the above named purpose:

1st. It is cheaper, all things considered, than most articles in use.
2d. It is the best and purest material known in the market, being entirely free from all offensive smell.
3d. It is the most durable, not being subject to rot after years of exposure to moisture and dampness.
4th. It is remarkable for its elasticity, rivaling, in this respect, the finest curled hair.
5th. It contains nothing to breed vermin or support insect life, being entirely freed in process of preparation from all deleterious vegetable matter.
Lastly. It does not pack; is free from dust; much lighter, and in general obviates all the objections to putr, prepared straw, soap root, and other inferior substitutes for feathers and hair. 22v16

HANSBROW'S CHALLENGE

Deep-Well, Mining and Double-Cylinder Patent Pumps.

Six-Inch Mining Pump.

These Pumps combine all the advantages of the common Lift and the Double-Acting Suction and Force Pumps, and are equally fitted for all—Household, Farm, Mill, Manu-
factory, Brewery, Ship, Railway, Mining, and other purposes, and are especially recommended on account of their light
ness, compactness, durability, cheapness, and the facility with which they can be placed in any position.

They are adapted for Hand, Steam, Horse, Water, or Wind Power. They are more durable in all their parts than any other Pumps of the same power.

Four-Inch Deep-Well Pump.

The Valves are of the simplest construction, and can be readily taken out by loosening two common nuts. They are not liable to get out of order, and can at all times be removed without the aid of a skillful mechanic.

The lower valves of these Pumps work upon inclined seats, which prevents sand or other matter that the Pumps may take up, from remaining under the valves, or stopping the flow of water.

These Pumps are worked with less friction, and consequently require less power than any other Double-Acting Pumps of equal capacity.

All sizes, from 2-inch to 8-inch Cylinder, manufactured by the Pacific Iron Works, GODDARD & CO., and for sale by the Agents,
LOCKE & MONTAGUE,
112 and 114 Battery Street, San Francisco.
Send for a descriptive Circular.

PAINE & STEPHENS' IMPROVED CONCENTRATOR,

For Saving Gold and Silver Sulphurets.

This invention, a perspective view of which is given above, consists in applying machinery to the ordinary buddle, and rendering the same automatic in action. It is calculated to do a large amount of work.

One Machine, costing about \$1,400, is sufficient to work the Sands from 25 to 30 Stamps. But very little power is required.

It can be easily run by one man turning a crank. The principle on which it works is entirely dissimilar from any other machine now used on the Pacific Coast; although it is in almost universal use in Europe; but not so arranged there as to be automatic in action.

The illustration given herewith, was fully described in the Mining and Scientific Press of March 21, 1868.

One of these machines may be seen in constant operation at the Eureka (Watt's) mine in Grass Valley, where it is giving the fullest satisfaction, and is working all the tailings from thirty stamps. Another machine may be seen at the Banner mill, in Nevada, and a third below the Gould & Curry Company's mill, near Virginia City.

For further information, apply to THOMAS N. PAINE, Grass Valley, California.

PAINE & STEPHENS.

Manufacturer of Brass, Zinc, and Anti-Friction or Babbet Metal Castings;
CHURCH AND STEAMBOAT

BELLS,

TAVERN AND HAND BELLS AND GONGS,

FIRE ENGINES, FORCE AND LIFT PUMPS,

Steam, Liquor, Soda Oil, Water and Flange Cocks, and Valves of all descriptions, made and repaired. Hose and all other Joints, Spelter, Solder, and Copper Rivets, &c. Gauge Cocks, Cylinder Cocks, Oil Globes, Steam Whistles,

HYDRAULIC PIPES AND NOZZELS

For Mining purposes, Iron Steam Pipe furnished with Fittings, &c. Coupling Joints of all sizes. Particular attention paid to Distillery Work. Manufacturer of "Garratt's Patent Improved Journal Metal."

Highest Market price paid for OLD BELLS, COPPER AND BRASS. 6f

SIXTH INDUSTRIAL EXHIBITION

—OF—

The Mechanics' Institute.

THE BOARD OF DIRECTORS OF THE MECHANICS' Institute hereby give notice that the Sixth Industrial Exhibition of that Association will be held some time in August next, in a building to be erected for the purpose, in Union Square, in this city. Every preparation will be made to accommodate exhibitors and visitors, with a view to make the Exhibition profitable, instructive and pleasant to all parties.

During the three years which have intervened since the holding of the last Exhibition in this city, the manufacturing, mechanical, scientific and useful and ornamental arts have made unprecedented progress on this coast, and it is believed that the proposed Exhibition will exceed any other in value that has ever been held on the shores of the Pacific.

The plan of building to be erected, which has been adopted by the Board of Directors, it is believed will prove to be the best adapted both for display and convenience of the public, of any building ever erected in the State. The building will be perfectly water-tight, being covered with a shingle roof, so that no damage from the elements can be anticipated.

All parties who are interested in any of the branches of Manufactures, Mechanics, or the Arts and Sciences, are invited to exhibit in the proposed Exhibition, and to share in the publicity and consequent profit which always attends such enterprises. Suitable premiums will be offered, and the specific date of opening the Exhibition will be published at some future time.

By order of the Board of Directors.

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1865, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING. 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECTED COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, \$125 per year of forty weeks.
The Libraries, Museums, Laboratories and Apparatus, accessible to students, are various and expensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v16-1y16p

Jackson's Patent Grain Lifter.

This is another useful and important California Agricultural invention, which was first exhibited at the last State Fair, in Sacramento, and which, in our notice of that exhibition, we promised to more fully describe and illustrate in a future number. As the season is now approaching when

This Lifter has proved itself useful in supplying a great want of the farmer, and its discovery is considered a public benefit, as all that it saves is clear profit to the farmer. The machine, as now made, has an elasticity to pass over the roughest of ground, strength for the heaviest lodged grain, and an adjusting lever, enabling the driver, by one motion of the hand, to adjust it to any height of grain.

With this improvement, the Header is enabled to cut the worst of lodged grain with nearly the same ease as if standing, and in standing grain it saves the straw-fallen grain, which averages five per cent. The engraving will enable any person to fully understand its use, and to put the same together. The upper cut represents the lifters only; the lower represents the lifters and header combined. The header needs no alteration, except that in very heavy grain the reel should run stronger; it should be set eight inches forward. The lifters as now made are much better than those which were first offered to the public; and are sold for \$60, with two sets of

Hungerford's Improved Concentrator.

Much attention is being given at the present time, to machinery for concentrating and separating sulphurets. It is now very generally admitted that a large number of the mines which have been abandoned for the reason that they will not pay for working, may be made profitable by a careful concentration and treatment of the sulphurets which have heretofore been suffered

engraving. These are pierced with small openings through which the pulp passes to the circumference of the concentrator. The bottom or floor of the pan is built upon a regular incline from the center to the circumference, and the whole is surrounded with a circular trough. When in use, the pan is subjected to a rapid vibratory or reciprocating action, by which the sand or quartz is kept upon the surface, and passed rapidly off through the opening in the center. The sulphurets gravitate to the

HUNGERFORD'S IMPROVED CONCENTRATOR.

to go to waste. Various devices have been introduced to accomplish the concentration; but the treatment for obtaining the gold after concentration, has generally been by the chlorination process. Among the concentrators, is one which was first introduced some few years since, by Mr. Morgan Hungerford, known as the Hungerford and

bottom and toward the outer edge of the machine, seeking the lowest part of the floor. From this position they work into the outer trough through a number of small openings in the inner wall, as shown by the two light spots near the opposite extremities of Fig. 2. In the bottom of this trough they come in contact with mercury, which takes up all the fine gold, and which can be drawn, at pleasure, through an opening at the bottom; while the sulphurets can also be drawn off through openings in the sides of the trough.

FIG. 2—Sectional View.

Prater concentrator, and which was described and illustrated in this paper soon after its introduction. Several modifications of the original machine have since been made, and great numbers of concentrators operating on that principle have been sold, and have been found to do their work quite satisfactorily. Mr. Hungerford has quite recently introduced still another modification of the original machine, an illustration of which is herewith given.

The general principle on which this machine works is known to most of our mining readers. Fig. 1 is a perspective view of the pan as now constructed by Mr. Hungerford. For economy of space and machinery, one shaft is made to drive two pans, which are set and arranged as shown in the engraving. Fig. 2, represents a sectional view of a single pan, showing how it operates in depositing the sulphurets. The pulp flows from the feeding spouts through a kind of bopper or bowl over the center of the pan, from which it is distributed through arms, as shown in Fig. 1, which have a kind of T attachment at their extremities. There are four of these arms, and their T extremities extend nearly around the entire inner circumference of the pan. The separation between them is much less than shown in the

It will be observed, by considering Fig. 2, that the sulphurets in the trough, at 3, 3, are maintained at the same elevation as the sulphurets and overlying sand in the body of the pan. It will, further, be observed, that by no possible means can the sand in the latter pass to the former in such quantities as to form any considerable percentage of the amount saved. The action of the pan is continuous, requiring no attention, except to remove the receiving vessels as fast as they are filled. These pans have been a long time in use, and appear to give very general satisfaction, as is evident from the numerous testimonials which have been submitted to our inspection, written by those who have used them, and some of which will be given in our advertising columns next week. The pan will hereafter be manufactured exclusively by the well known foundry firm of Goss & Lambard, at Sacramento, to whom communications may be addressed; or to M. Hungerford, in this city.

TO ALL INTERESTED, whether ladies or gentlemen, in promoting the welfare of the sewing women of the city, it will be a pleasure to learn that they can find better and cheaper underwear of all kinds, and childrens' clothing, at the Coöperative Union, 39 Second street, than anywhere else in the city.

JACKSON'S PATENT GRAIN LIFTER.

there is a pressing call for this class of machinery with which to gather our incoming crops, we have taken the present occasion to present our promised illustration of this machine. The object of the invention is to enable the farmer to save that portion of his grain which has been lodged or broken down, so as to lay below the reach of the "header." It runs ahead of the cutting teeth, and with its long fingers carefully picks up the fallen or trampled grain, and carries it direct to the cutting teeth; thus saving from one to two sacks of grain on almost every acre of ground—often more. Those who have used the machine—and the number of such is large—say that it saves from \$30 to \$50 per day, according to the condition of the grain. A diploma was awarded to this useful invention at the last State Fair.

fingers (long and short) as shown at No. 1 and 2. Treadwell & Co., of this city, Sacramento and Marysville, are general agents for the machine. William M. Jackson, Woodland, California, is the patentee.

ALLOYS OF TUNGSTEN WITH OTHER METALS THAN IRON.—Since the introduction of processes by which tungsten has been separated from its ores, and since its value as an alloy with iron has been made so manifest, numerous experiments have been made in the hope of combining it usefully with such metals as copper, tin, brass, German silver, etc. From the peculiar nature of tungsten, it has been thought that it might have the property of imparting additional hardness or toughness to such metals, and that they might thereby be also materially protected from oxidation. In no case, however, has any beneficial result been obtained for the metals named. Iron seems to be the only metal which can be improved by an alloy with tungsten.

Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

Mount St. Helena Copper Mines.

EDITORS MINING AND SCIENTIFIC PRESS. I had occasion, recently, to examine some of the copper discoveries on the N. E. side of the noted mountain above named. The principal lode, so far as is yet shown, is situated twelve miles northerly from Calistoga, in Napa Valley. It is a few hundred yards to the left of the stage road leading from the latter place to Clear Lake, outcropping on the side of a deep cañon formed by Lillie's Sawmill Creek. Mr. George Lillie discovered it about a year ago, and located a claim of 1,600 feet, which is known as the "Lillie Mine." Immediately north, an extension is located of 3,000 feet, known as the "Blackstone." There are other locations on what is supposed to be the same lead. I believe, however, the metal has only been struck in the first two, from which handsome specimens of metallic copper and some excellent ore have been taken. There seems to be really three parallel lodes about 100 feet apart, showing in both the Lillie and Blackstone claims. They are included, I believe, in the same location, being considered as one vein. Deeper explorations may prove the theory correct, but they are widely separated in their outcroppings. No distinct casings are apparent, and therefore there are no positive proofs of their being true veins. A few excavations have been made at points on the outcroppings, but none of sufficient depth to demonstrate the value of the lode. A tunnel has been commenced to strike the Blackstone at a considerable depth, and the Superintendent in charge seems to be prosecuting the work with zeal and vigor. A preliminary incline on the lode following the face of the vein matter down to a considerable depth, would have enabled him to start his tunnel with more certainty of its future usefulness. An incline shaft acquaints the miner with the varying character of his vein, in dip, breadth and lithological changes of the ore, which often differs so greatly from the surface appearances as to render the identity of the lode unrecognizable at a short depth below. The surface dip can never be relied upon, as it is almost certain to greatly change within the first hundred feet. No reasonable calculation can therefore be made of the length of tunnel required to tap the vein. Often the vein is passed through without the fact being known, from the dip changing sharply towards the tunnel; thus striking it sooner than anticipated, and at a point where the vein may be pinched to a mere thread. A change in the dip away from the tunnel, places the point to be cut so distant that the work is occasionally abandoned in despair. At times a tunnel may pass between the broken ends of a fault, and never touch the vein at all. All this trouble is avoided by following down from the surface, and a tunnel may then be located with a certainty as to its extent, availability for drainage and extraction of ore. A tunnel is rarely suitable for preliminary exploration of a mine. The folly and inutilty, as well as the ruinous expense of exploring tunnels, has been but too thoroughly demonstrated in the early and crude, but energetic workings, of the silver mines of Nevada.

Both the Lillie and Blackstone claims are favorably located for work. A fine stream of water runs through the cañon. A tunnel driven from the level of the stream would cut the veins probably four or five hundred feet deep. The inferior ores might be here stamped by water power, and concentrated. Twelve miles of transportation by wagons would reach the Napa Valley Railroad. Should the ores therefore be

abundant, even a low grade could be made available.

The strike of these lodes is northerly and southerly, with a dip of about 20° from the perpendicular to the west. They seem to be from one foot to two and a half feet in breadth. The formation is a talcose slate. It is in this same belt of talc-slate that the "Mammoth" Cinnabar lode, claimed to be five miles long, is located, which is thought by the miners to be a continuation of the Phoenix lead, in Pope Valley. A vein of chromic iron, I was told, existed not far from the Blackstone. I was unable to visit it. From the general aspect of the country, one might readily conjecture its mineral character. Mount St. Helena, and the adjacent country, is classed by Whitney among the cretaceous rocks, intermingled with volcanic formations. The volcanic rocks predominate near Clear Lake, and the district is marked by hot mineral waters, beds of sulphur and lakes of borax. Of these I shall have occasion to speak in another letter.

JOHN A. VEATCH.

EDITORS MINING AND SCIENTIFIC PRESS. Recent Washington news mentions the report that J. W. Taylor, Commissioner for the collection of statistics of gold and silver mining, was sent to the House May 2d, and that in connection with other matters which the report discusses, the Commissioner says: "It is understood that the Secretary of the Treasury has continued the mining commission of the department, directing special inquiry into the best methods for the economical reduction of obstinate sulphurets, which have hitherto obstructed the economical reduction of gold-bearing rock."

This is the most sensible and important action which the government has yet taken in regard to the mines; and if it had the proper facilities for carrying out the intention, very important results would follow, and very valuable information be obtained. If it is the duty of the Commissioner only to learn of all the means now employed for working ores, and report those which are most successful, he will be doing well. But how much more could be accomplished if the government would offer a prize for the best manner of reducing gold-bearing sulphurets, by methods not now known—say \$20,000. That would set into active thought and experiment every gold miller and miner in the country, and might do more in one year to solve the problem of gold extraction, than the inquiries of a Commissioner would in ten. The attention of our Congressmen should be drawn to this matter. The combinations of gold with its matrix are yet but imperfectly known, and very few are willing or able to pursue the investigation to the point of success. Capital that is employed in mining and reducing quartz, wants immediate returns. It will not spend itself in experiment on what is untried; but contents with what can be gained with present appliances, if it pays the percentage. If it does not, it is dropped. The idle mills all through California attest this; yet with such knowledge as could be brought out by a large offer, there need be no idle mills in the whole State.

EL DORADO.

CURIOS EXPERIMENT.—Our interior friends, in some of the remote mining cañons, who rarely hear the sound of a deep-tuned church-bell, may treat themselves to as much as they like of it, at a cheap rate, by observing the following simple directions: Take a common steel or iron poker, or indeed any bar of iron two or three feet in length, and to one end attach a piece of tape eighteen inches long, by a "clove-hitch" in the middle. Then taking one of the two tape-ends in each hand, stop your ears with your fore-fingers, carrying the tape-ends with them. Now swing the poker against a chair. The result will be highly satisfactory.

Correlation of Electricity and Magnetism.

In 1831 Faraday discovered electrical induction; it is the most important, although perhaps not the most brilliant of his discoveries. Ten years before (in 1821) he had observed a perfectly new phenomenon in the science of electro-dynamics,—that science which issued complete, as we may say, from the brain of Ampere, after Oersted's discovery. Struck by the experiments of the great French physicist upon the mutual attractions and repulsions of electrical currents and magnets, Faraday was led, by theoretical ideas which were rather disputable and not very conformable to the principles of mechanics, to assume that an electric current must turn round the pole of a magnet with a continuous movement, and reciprocally that the pole of a magnet must in like manner turn round an electric current. He verified this double result by experiment; and Ampere soon showed its accordance with his theory, adding to it other facts of the same nature. It is not the less true that the discovery of a continuous movement of rotation due to the combined action of a magnet and an electric current was quite unforeseen, and at the same time very important; for up to that time there was no example of any such action in physics. It was the first step in the course which was to yield to the finding of a relation between mechaical movement and the molecular forces.

Arago (in 1824) was the first who directly established this relation, by his beautiful discovery of magnetism by rotation; for he showed that simple mechanical movement could render a body, in itself, non-magnetic, capable of acting upon the magnet. Faraday advanced still further in 1831, by discovering that it was sufficient to bring toward, or remove from, a metallic wire forming a closed circuit, another parallel wire traversed by an electric current, or simply a magnet, in order to develop in the former wire an electric current. He discovered induction—that phenomenon which so many others had sought in vain, although suspecting its existence, but which he alone had succeeded in producing.

Let us dwell for a moment upon his fundamental experiment. Two metal wires covered with silk are rolled together round a cylinder of glass or wood; the two wires are thus isolated, and have all their spires approximate and parallel. An electric current is passed into one of these wires; immediately a current is manifested in an opposite direction in the neighboring wire, the extremities of which are united by a galvanometer; but this current only lasts for a moment. The current passing through the first wire is interrupted; immediately another current is developed in the second wire, which is momentary, as in the former case, but directed in the same way as the producing current, instead of in the contrary direction. The momentariness of these two currents, and the fact of their alternately opposite directions, constitute the two important characters of this new mode of production of electricity.

Faraday did not stop at this. Starting from Ampere's idea that a magnet is only an assemblage of electric currents arranged round an axis in a manner very analogous to the circulation of an electric current through a metallic wire rolled into a coil, he tried the replacement, in his fundamental experiment, of the wire traversed by the current by a simple magnet. For this purpose he twisted a single wire instead of two into a coil round a glass or wooden tube; then he introduced a magnet into this tube, and ascertained that at this moment a momentary current is developed in the coil of wire, and that a second, equally momentary but in an opposite direction, is developed at the moment when the magnet is withdrawn. Here, therefore, was realized that production of electricity by magnetism which Faraday had long been seeking; convinced, as he was, that, as electricity produces magnetism, magnetism in its turn must produce electricity.

ACOUSTICS.—M. Regnault, of the French Institute, has been making use of the new sewers of Paris for the purpose of testing, on a large scale, some questions in acoustics concerning which there has been doubt. By firing a pistol in the sewers of various diameters, he found that the sound was carried to the following distances: 1,282 yards in a passage of 4.2 inches diameter; 4,191 yards in a passage of 11.8 inches diameter; 10,494 yards in a passage of 43 inches diameter. The nature of the materials and the construction of such passages exercises great influence on the rapidity with which sound is transmitted.

THE INEVITABLE FUTURE.—The *American Journal of Mining*, in allusion to the recent lecture of Prof. Jevons at the Royal Institution upon the probable exhaustion of the English coal mines,—which cannot be far off, at least as regards economical production compared with the mines of "other countries,"—makes the following remarks: Suppose, then, that in fifty or a hundred years, England's great supply of power becomes so exhausted that "instead of producing more than half the total supply of coal in the world, she should produce only a small fraction of it." The result would be gradual, but the inevitable and final ruin of her commercial supremacy. It is not only the diminution of the coal that portends this change. Several important social and political signs point in the same direction.

In the first place the encroachments of Russia in Asia, and the schemes of France in Egypt and Arabia, tend to deprive the British Empire of its vast Indian provinces, or, at all events, to take from England the only thing for which she values those provinces, the Indian trade. On the other hand, the Pacific Railroad and the steamship line from San Francisco to China put New York like a toll-gate between England and that quarter of the world. English houses will be obliged to establish their branches and agencies here; American houses will multiply and wax strong; coal or no coal, the world's commercial center of gravity is changing its place.

The social condition of England herself is no less significant. Every year shows the soil of that country distributed among fewer proprietors. Large tracts of land are returning to the uncultivated condition, to serve as parks and preserves for gentlemen; the rich are constantly growing richer, and the poor, poorer. Hundreds of thousands are annually leaving the shores of their native land to seek in the New World that permanent foothold which they cannot maintain at home.

Wise proprietors of mines or factories know very well that to secure willing, faithful and permanent labor, they must give their workmen homesteads. "A cottage and a piece of ground" goes a long way. But society in England is organized on the opposite plan, and when that day has come, the portentous shadow of which already darkens the noon of national prosperity; when the diminished resources of England can no longer maintain, in spite of geographical disadvantages, her commanding commerce and manufactures, there will be nothing to prevent the workmen from leaving that soil which they do not own. The operation of all these causes may be delayed by measures of wise statesmanship; but we do not see how the result can be considered otherwise than inevitable.

THE CHLAMYDER.—In a new work by M. Pouchet, Director of the Rouen Museum of Natural History, and correspondent of the Academy of Sciences, the habits of this curious bird, which apparently cares more for a splendid than a comfortable home, are thus described:

"The speckled chlamyder is a bird resembling our partridge, but distinguished from it by its deep color relieved by clear spots, and by its neck, which is adorned with a red collar. For the location of their nest, the couple choose an open place exposed to the sun and to the light. Their first care is to make a path of round pebbles; when they deem it to be sufficiently thick, they begin by planting in it a little avenue of branches. They are seen for this purpose to bring from the country slender shoots of trees of about the same size, which they thrust solidly by the thick end into the interstices of the stoues. These branches are disposed in two parallel rows, converging a little in such a manner that they form a miniature shrubbery. The plantation is a yard in length, and is sufficiently wide to allow the two birds to walk alongside of each other in the interior. This grove being finished, they devote themselves to embellishing it. Each starts out foraging in the fields, and brings back all the sparkling objects it can pick up—pearl shells, birds' feathers, all that charms the eye. These trophies are suspended at the entrance to the grove, which soon begins to shine in the sun like a palace of the Arabian Nights. In the places frequented by the chlamyders, if a traveler loses his watch, his knife, his seal, he does not spend his time looking for it on the ground; he knows where to find it."

TELEGRAPHING FOR THE BLIND.—A telegraph operator proposes to have the blind taught to read telegraphic signals by touch and sound; and those who are deaf also, by touch alone. The idea is an excellent one.

Mechanical.

HARDENING IRON AND STEEL.—A patent has recently been obtained for an improved method of accomplishing the above named object, by a resident of Worcester, Mass. The *Scientific American* thus describes it:

The article made of iron or steel, to be carbonized or hardened, is immersed in a bath of molten cast iron and allowed to remain the desired length of time, after which it is removed and thrown into cold water. It is found that the melted cast iron works the best when heated to the degree required by foundries for pouring good castings, and when thick or large pieces are to be carbonized or hardened, it may be well to raise the heat of the molten metal still higher. The depth at which the metal will be carbonized and hardened will depend much upon the length of time it is allowed to remain in the molten bath of cast iron, and also somewhat upon the degree of heat to which the melted metal is raised, so that each operator can, by a few trials obtain almost any desired depth of carbonization or hardness, whether operating upon iron or steel. The article, if instantly drawn from the bath, as soon as immersed, and plunged into cold water, will be carbonized to a slight depth, which may be all sufficient.

It is claimed that by this plan, articles made of iron may be carbonized and hardened at slight expense, so as to have a surface equal in resistance and hardness to the best tempered steel, while at the same time they retain an elasticity which prevents their breaking.

ADSORPTION OF POWER BY SHAFTS AND BELTS.—Only the crudest means are at present available to ascertain the amount of power transmitted by pulleys and belts. So many conditions are to be considered that the construction of a set of rules for calculating the amount of power in all cases, is simply impossible. Not only the width of the belt, the diameter of the pulleys, and the relative position of the shafts, but the condition of the belts and the velocity of the shafts, must be taken into consideration, together with the peculiar circumstances which every separate case presents.

It is well known that the closest mathematical calculations, based on the style of engine, diameter of cylinder, length of stroke, velocity of piston, pressure of steam, and other points of a steam engine fail to give accurately the amount of power the machine may develop. The actual trial by means of the indicator in the hands of a skillful manipulator is the only reliable test. From one of the best—if not the best—masters of the indicator in this country, we learn that engines calculated by their builders to give a certain amount of power often so signally fail of achieving the result desired, that in one recent instance an engine calculated for 60-horse power had run for months yielding less than 26-horse power! The indicator showed the fact, and the experience of the operator detected the fault and pointed out the remedy.

Now if in a machine constructed with such care and skill as the steam engine, such a wide difference should be found between the calculated and indicated horse power, what difference should we not expect, when the test is applied to a case presenting so many points of possible variation between the intended and real amount of power as that of belt transmission? And it is the fact that in very many cases the proprietor of steam power, knowing the actual power of his engine, finds that while letting for hire what he deems is one-half of that power, his tenants are absorbing nearly the whole available power.—*Scientific American*.

SHRINKAGE OF CAST IRON.—Mr. David Walker recently read a paper before the London Association of Foreman Engineers, in which he dwelt upon the necessity of careful "feeding" by the molder to keep up the head; otherwise the casting inevitably becomes unsound. Exteriorly, it would take the form of the mold, but in the center it would be hollow; the experienced molder so arranged his feeding head as to supply those parts of the casting which were thicker than others.

ALUMINUM BRONZE.—The invention of this alloy is said to be a disputed point between France and England; the first claiming St. Clair Deville and Devray, and the latter Dr. Percy, as entitled to the merit of the invention. In the proportions of ten per cent. aluminum to ninety per cent. of copper, it resists oxidation and friction, is elastic, and has a strength nearly that of cast steel.

USE OF THE DIAMOND IN CUTTING

GLASS.—A writer in the *Scientific American* says: Not over one-half of those who use this tool do so intelligently. A true diamond-cut in ordinary glass, is a beautiful, clear, hair-like line scarce observable, and noticed plainly in silvered glass only on account of reflection. The usual so called "cut" with many is a heavy white line, something they can see, or they are not satisfied. Such a cut is mere abrasion of the glass, in the part over which the diamond has traveled.

The cutting point is found, in the ordinary glazier's diamond, somewhere between the perpendicular and the angle at which a pen is usually held while writing. This point must be sought for, and the diamond used only by one person. Here is applicable the frequently urged advice, "study the use of your tools," and have your own "kit."

The natural philosophy of the diamond-cut in glass has not yet been satisfactorily explained, though studied over by some of the first minds in this country and in Europe. After the fracture of a piece of well cut glass, the track of the diamond is marked by a serrated line (something like saw-teeth) of a beautiful regularity, penetrating to the depth of about 1-64th of an inch, varying slightly according to pressure. This appearance is quite plain to the naked eye, but under the microscope shows its full beauty and gives cause for astonishment. Thus seen it presents the idea of the line of holes in a sheet of postage stamps, with the exception that the holes are much closer, and appear as if made with an oval instead of a circular punch. A true cut is the result of much practice and study, and will become familiar by a clear, whistling, somewhat musical sound.

PHOSPHORUS IN IRON.—The deteriorating effects of phosphorus in iron, furnish a very striking illustration of Lord Palmerston's definition of "dirt"—matter in the wrong place. The phosphorus in Cleveland iron, which so seriously reduces its value in the market, and renders it necessary to bring iron from other districts to mix with the iron of the district in the puddling furnaces, and to use the ores of other districts to mix with its own—would, if extracted, even in its lowest priced form—as a manurial ingredient—be worth at least £66 per ton; as one ton of phosphorus is equal to two ton five cwt. of phosphoric acid, or four ton ten cwt. of the highest qualities of Patagonian, or seven tons of Peruvian guano. There is therefore a tolerably good margin for working expenses if the process by which the phosphorus is extracted is carried out on tolerably economical principles. For instance, iron which is now worth 47s. per ton, when containing one per cent. of phosphorus, would, if freed from this element, be worth at least as much as hematite iron, or say 54s. per ton.

A NEW METHOD OF COATING METALS.—The usual method of covering sheet iron and other hard metals with tin or alloys, has been to dip the plates first in acid and then in a solution of the coating substance. By this process only comparatively small sheets could be coated. A new one, described by the *Scientific American*, consists in spreading sheets of the coating metal upon the sheets to be coated, and subjecting the two together to heavy pressure between rollers. Sufficient heat is thereby produced, to make the two unite firmly. Sheets of any size may thus be coated with a perfectly uniform surface.

PATENT WEIGHING CUP.—A Philadelphia man has taken out a patent through the *American Artisan* office for a tin dipper so graduated by marks and numbers on the outside, that the depth to which it sinks when placed in a pail of water and steadied with the hand by the handle, will indicate the weight of its contents. All that is necessary to weigh, for example, a pound of butter, is to fill in the butter until the one-pound mark is on a level with the water.

AMERICAN CAST IRON.—An English engineer, now in New York, writes us as follows: "The cast iron here astonishes me. I saw in Brooklyn navy-yard a cast iron naval gun which had been hit by a Southern shot about four feet from the muzzle, and the shot had left its mark, impressing the rifling quite clearly. There was not a crack upon the surface of the gun; but the dent was driven right through the thickness of the gun and reproduced in the chase, so that a closely fitting shot could not be fired from it."—*Engineering*, April 17th.

Scientific Miscellany.

The Mastodon and the Tapir in California.

The *American Journal of Science and Arts* for May, has a paper from Prof. B. Silliman, announcing the fact that remains of the mastodon have been "identified as occurring under the basalt which covers the ancient gold drift, and forms the highly characteristic ranges known as Table mountains." His attention was called to such remains by discovering a portion of an *os ilium* in the collection of Judge Preston, of Jamestown, Tuolumne County, which had been found in driving a tunnel under the basalt in Table mountain, at a point 1,500 feet from its mouth. The point of a tusk was also found. Both of these specimens were secured by the Professor, and are now in the Peabody Museum at Yale College.

As further and confirmatory evidence that these bones were taken from beneath the basalt, he learned from Mr. D. T. Hughes, who is engaged in exploring a tunnel, formerly called the "Maine Boys' Tunnel," upon the southwest side of the same mountain, that at a point about 1,600 feet in, bones had been some time since uncovered, but were at the time of the Professor's visit inaccessible, owing to the falling in of a portion of the work. Upon his departure from California in January last, he urged Mr. Hughes to use all diligence in the search; and on March 24th he received from him a letter, a portion of which the Professor includes in his paper, stating that he had reached the bones, and giving a description of them as they lay. Being very much decayed, they could not be removed entire; but four grinders, which were in a tolerable state of preservation, were secured, and are now in the possession of Mr. H., who inclosed to the Professor sketches of three of them. Several fragments of the bones were obtained. Measurements were also taken of the two tusks, which lay together, and which, although large pieces of the points had apparently been broken off, were still seven feet and one inch in length. Two of the grinders measure each six inches in length by three and a half inches in width, and the other two each four and a half inches in length and two and three-quarters inches in width. These remains "were found 1,650 feet in under the Table mountain, and four and a half feet above the ledge or bottom slate, imbedded in a stratum of sand overlying a deposit of gold-bearing gravel, and scattered over a space twenty feet long by ten or twelve feet wide." Professor Silliman thus closes his paper:

From Mr. Hughes' description and the accompanying drawings, there is no room to doubt that the bones discovered are those of the mastodon, and it appears probable that nearly the entire skeleton of a full-sized animal was entombed in the sands resting immediately upon the ancient auriferous gravel beneath the Table mountains, and of course anterior in age to the period of volcanic activity and overflows of lava, which have hitherto been considered as marking the close of the Pliocene era, a catastrophe which appears to have exterminated the other members of the Pliocene fauna.

If the mastodon survived the catastrophe which exterminated the hippopotamus, rhinoceros, tapir, etc., and continued through the Post-Pliocene, to the appearance of man, it yet remains to be proved that man was his companion prior to the dawn of the existing epoch.

In the same Journal, Prof. Wm. P. Blake gives a note upon the occurrence of fossil remains of the Tapir, in California, which we give entire as follows:

The remains of Tapir occur in the auriferous gravel of Wood's creek, near Sonora, in Tuolumne county, California. They were found by gold miners at a depth of about forty feet below the surface, and were presented to me by Dr. Snell, of Sonora. A specimen submitted to Prof. Owen at the British Museum was recognized as the

"crown of the left lower molar tooth of a tapir, and another specimen as the posterior epiphysis of the cervical vertebra of a hoofed animal, probably a young tapir." Numerous teeth of the mastodon have been found in the same region, together with stone implements of various forms. Some of the latter, according to the statements of Dr. Snell, were taken from the deep placer deposits which underlie the lava of Table mountain.

TEST FOR BROMIDS IN THE PRESENCE OF CHLORINE.—Surgeon J. H. Bill, U. S. A., contributes to *Silliman's Journal* a paper upon this subject, the essential parts of which we here give:

The Fresenius test solution of auric chlorid produces in faintly acid solutions of alkaline bromids, a coloration ranging from dark orange red, to light straw color, according to the strength of the solution. Iodids must be out of the way. Chlorids, however, do not interfere in the least. The following is the best way of applying the test. Separate iodids by palladium, and after getting rid of excess of palladium, by sulphureted hydrogen, concentrate the solution to about twenty-five cubic centimeters. Select two test tubes of the same size and shape, and color of glass. Into one pour the solution suspected to contain bromid. Into the other pour pure water, adding perhaps a trace of chlorid potassium; add now to each test tube, a drop of chlorhydric acid, and then to each one drop of auric chlorid solution. On now comparing the two tubes particularly in the direction of their long axes, a yellow color will be observed in the tube containing the bromid, and made very manifest by comparison with the other tube.

The following experiment shows the delicacy of the test applied as above. One centigram of potassic bromid was dissolved in 1,000 cubic meters of water. Thirty centimeters of this solution, compared with thirty centimeters of a very weak solution of potassic chlorid, gave a decided yellow color. This experiment was varied by dissolving a gram of potassic chlorid in 2,000 cubic centimeters of water, halving, and adding one centigram of potassic bromid to the one-half. Thirty centimeters of each of the two solutions now tested, gave ample evidence of the presence of bromid.

The mixed chlorid and bromid should be brought to the state of salts of the alkalis if necessary, by precipitating with argentic nitrate, thoroughly washing, and fusing with potassic carbonate. If sodio carbonate is used, the subsequent reaction with the gold test is not so decided.

OZONE.—The *Journal of the Franklin Institute* for April, says that a youthful physicist of its acquaintance, who has one of those collections of chemicals and apparatus known as Crew's Laboratories, while trying the development of ozone by the action of a heated glass rod upon a mixture of air and ether, varied the experiment by substituting oxygen for air and a glass tube for a rod. Under those conditions, a tremendous detonation was the result of the introduction of the heated tube into the mixture. Supposing that the glass might have been too hot, he repeated the experiment, but again an explosion followed, although the tube was not sufficiently hot to burn the closed hand, when drawn through it. A glass rod was then dried, but although at a low red heat, it produced no such result.

The explanation is obvious. The position of mixed gas and vapor inside of the tube, being confined, was so completely acted upon, that ozone in sufficient purity and bulk to ignite the vapor or mixture was produced; while in the case of the rod, that part of the oxygen converted into ozone at each instant, was too rapidly diffused and diluted for such a result.

DELICATE TEST FOR ALKALIES.—According to Boettger, the coloring matter of the common ornamental plant *Coleus Verschaefeltii*, is readily turned green by alkalis. By digesting the fresh leaves for 24 hours in cold absolute alcohol to which a few drops of sulphuric acid have been added, a solution is obtained from which paper of a fine red color may be prepared. The color is not affected by carbonic acid, and hence it readily detects the presence of earthy carbonates, in natural waters. Its sensibility is very great; a piece of the paper held in the flame of illuminating gas, is at once turned green by the ammonia present.—*J. Pr. Ch.*, 1867.

The Gatling Gun.

This automatic machine gun, an American invention, appears to have proved one of the most successful inventions of the day. This gun is loaded and discharged continuously, by the simple turning of a crank. The ammunition, which is put up in metallic cartridges, is fed to the barrels from a hopper, as corn is fed to a mill. The first Gatling gun was made in 1862, in Indianapolis, Ind., the home of the inventor. The next year he had a battery of six guns made at Greenhard's establishment in Cincinnati, which was destroyed by fire in the shop. Twelve other guns, with six barrels each, were soon afterwards made at Wells' Type Foundry in the same city. Several of these were sold to the U. S. Government, and were the ones employed by Gen. Butler, near Richmond.

Important improvements were made by the inventor in 1865, and the improved gun was tried before the U. S. Ordnance Department at Washington, with so satisfactory a result, that the Chief of Ordnance ordered several larger ones made for the Department capable of throwing balls of half a pound weight. Eight accordingly were made at Philadelphia, which were submitted to a very prolonged trial at Washington, with most satisfactory results. Gen. Grant, with several other generals and Secretary Stanton, witnessed the trials. One of the guns was sent to Fortress Monroe, where it was submitted to still farther trials as a flank defence for fortifications, and with so much success that *one hundred of these guns* were immediately ordered for the United States service, the guns to be built at Colt's Armory at Hartford.

Two of these guns were exhibited in the American Department of the Paris Exposition; one of them was taken out and submitted to a trial in the presence of the Emperor and Minister of War.

The Gatling gun has since been tried in the presence of the Emperor of Austria, at Vienna; before the King of Prussia at Berlin, and the Czar Nicholas, at St. Petersburg. Official trials have also been made at the Hague, Holland, and before the officials of several of the minor governments of Europe,—all of which experiments are said to have been in a high degree satisfactory; and orders for their construction in greater or less numbers have already been received from nearly every government in Europe. Large numbers of these guns are now being turned out at Colt's armory, where their manufacture has been carried to the utmost perfection by the employment of machinery constructed expressly for this manufacture. They are made on the same plan as the government arms—each and every part being interchangeable from one gun to another. A few men with such a gun, it is believed, can do the work of an entire regiment. Such a thing as storming a position defended with a few of these guns would be utterly impossible. The patent right is owned by the Gatling Gun Company, with the principal office in the city of Indianapolis.

A NEW GAS BURNER has recently been introduced here from the eastern States, known as "Locke's Patent Self-Lighting Gas Burner," and patented in 1867. We understand that the new Mercantile Library building has been furnished with this burner, also several other places in this city. Samples can be seen at Mr. George H. Chick's, 834 Market street. We hope to give an illustrated description of this burner at an early day.

THE HUE AND CRY-OLITE FLUX.—"The Stevens flux,"—says the *American Journal of Mining*,—"seems to be going a-begging. What is the matter? Does not the Lisbon Gold Company require a new supply?" Our readers will remember that we gave a full description of this flux, its composition and its pretensions, in the Press of May 30th.

New Patents and Inventions.

Under this heading we shall mention, from week to week as occasion may demand, New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

List of patents issued from the United States Patent Office for the Pacific Coast and Territories for the week ending May 12th, 1868:

IMPROVED TRUNK LID SUPPORTER.—Samuel Wehrly, San Francisco, Cal.

IMPROVED CHART ROLLER.—E. L. Hagan, Empire City, Colorado Territory.

IMPROVED SHOE FOR AMALGAMATORS.—John H. Bullock, Gold Hill, Nev.

IMPROVED CARRIAGE SPRINGS.—Walter B. Higgins, San Francisco, Cal.

IMPROVED HARNESS LOOP.—George W. Roland, Salem, Oregon.

IMPROVED MACHINE FOR TREATING HIDES.—Herman and Louis Royer, San Francisco, Cal.

IMPROVED MACHINE FOR MAKING DRAIN PIPE.—Robert Skinner, San Francisco, Cal.

IMPROVED BOOT AND SHOE LAST.—James H. Swain, San Francisco, Cal.

PATENTS RECENTLY ISSUED.

77,183.—IMPROVEMENT IN CHART ROLLERS. E. L. Hagan, Empire City, Colorado Territory:

I claim the chart roller constructed as described, consisting of the case C, having the hinged lid H, and adapted to receive the chart rollers B, said chart passing through the curved opening E, their operating cords F, passing through separate openings in front of the charts as herein shown and described.

77,674.—IMPROVED APPARATUS FOR PRODUCING MOTIVE POWER.—Edward Stockton and William O. St. John, Folsom, Cal.:

1. I claim the combination and arrangement of the springs I, L, weights P, P, and gears J, J, said gears being so connected with their respective shafts that they remain stationary, while the shafts are turned to wind up the springs and weights.

2. The ratchet-wheels L, L, for connecting the gears with the shafts, in combination with the couplings E, E, substantially as and for the purposes described.

This invention relates to that class of machines for obtaining motive power by the employment of springs, weights, wheels and pulleys, for driving windmills, pumps, churns, grindstones, etc., etc., and supplying power for other purposes, and consists in attaching steel springs to a shaft placed transversely across a frame which is permanently attached to a bed. Two other shafts are also placed transversely across the frame, the spring-shaft and center-shaft being geared together, and operated by toothed wheels. The outside or front of the two shafts above named is a driving-shaft, and is engaged by the teeth on the gear-wheel of the center-shaft. This shaft has a pulley at one end, and a crank near the other end. To the center-shaft are attached cords or chains, passing over grooved wheels, which are attached to a roller that is suspended above the machine. The center and spring shafts are provided with keys, for winding up the springs and drawing up the weights. Ratchet wheels, provided with pawls, are placed upon the shafts beside the two toothed wheels, which prevent the springs and weights from running down and unwinding, except by the operation of the driving-shaft.

77,918.—IMPROVED HARNESS LOOP.—Geo. W. Roland, Salem, Oregon:

I claim a winged metallic loop for attachment to harness, constructed to operate substantially as described.

77,920.—IMPROVED MACHINE FOR TREATING HIDES.—Herman and Louis Royer, San Francisco, Cal.:

1. We claim the vertical shaft B, with a slot B', and set-screws b, b, h, said shaft having a forward and back motion, substantially as and for the purpose described.

2. The pins or rollers c, c, c, set in rings D and D', together with the grooved weight I, substantially as and for the purposes described.

This invention is designed to provide an improved machine for converting raw hides into a leather suitable for beltings, lacings and other purposes where it is desirable to

preserve the native strength and toughness without destroying or impairing the natural fibers or grain of the skin. To accomplish this object, the inventors employ a machine mounted on a suitable frame, having a vertical slotted shaft, to which is attached, at its base, a beveled wheel between two beveled pinions upon a horizontal shaft. Around the vertical shaft is placed a row of vertical pins or rollers, held in place by upper and lower rings, one of which is firmly bolted to the frame. An iron weight or press is employed for crowding the coil of hide down after it has received a forward and back action around the shaft. This action produces the desired result of stretching in one way, compressing, corrugating or roughening in the opposite direction. The pressure downwards by the iron weight compensates in a measure for the stretching of the hide lengthwise in the action about the shaft. The hide, after being thus operated upon, is treated with oil or tallow in the usual way, but not blacked. By this treatment the leather is rendered very tough, and the natural fibers or grain is not injured; but is rendered stronger and more lasting, for the purposes designed, than by any other machine or process.

77,925.—IMPROVED MACHINE FOR MAKING DRAIN PIPE.—Robert Skinner, of San Francisco, Cal.:

1. I claim the follower G, constructed with slots G' G' and the curved openings, F F, in which it slides in combination with the stationary core E, and ring N, substantially as and for the purpose set forth.

2. In combination with the above claimed apparatus, I claim the steam jacket J, for heating the same, and the material worked thereby, substantially as described.

The object of the above invention is to provide an improved machine for making drain and water-pipes. It consists of a stationary cylinder, in which a core is placed; a follower, attached to a piston-head, moves up and down around the stationary core, passing through slots in a center-block. A close-fitting packing ring is placed around the core, and slides up and down upon it by the action of the piston or follower. Another ring is placed at the top of the cylinder, and the cement or material of which the pipe is made is held between the two rings around the core in the cylinder. A cross-head is placed over the top ring, which is regulated by hand-wheels or set-screws. The pressure upon the material between the two rings is derived from the engine driving up the piston. Power is applied to the piston end of the machine, either by steam, by hydraulic or any other power that will produce the required pressure.

77,931.—IMPROVED BOOT AND SHOE LAST.—James H. Swain, of San Francisco, Cal.:

I claim the projection or flange C, or its equivalent on the face of the last, substantially as for the purpose specified.

This invention relates to the construction of an improved last for the manufacture of nailed or pegged boots and shoes. It consists in attaching a metal bottom or sole to the ordinary last. This bottom or sole has a projection or flange on its face, so that when the nails or pegs are driven through the sole, they will be battered down or turned up and clenched, and not protrude, as is the case when a wooden last or a metal face or bottom is employed without the flange or projection around it. In the manufacture of cased work, the screw as it penetrates through the leather sole, will be arrested by the projection upon the plate before it penetrates too far, thereby rendering it necessary to cut off the projecting end. If the last is made entirely of metal, the flange may be cut upon the face, in the same manner as it is now cast with the plate.

NEW INCORPORATIONS.—Articles of incorporation have been recently filed in the County Clerk's office in this city as follows:

BEAR RIVER MINING CO.—May 29th. Capital stock, \$300,000; 3,000 shares, \$100 each. Trustees: Geo. Clark, A. G. Picr, J. M. Buflington, W. J. Stringer and Wesley Henderson.

CALIFORNIA ANCHOR CO.—June 4th. Capital stock, \$600,000; Trustees: Wm. H. Ladd, H. F. Williams, Wm. H. Lyon, G. A. Lloyd and C. A. Stewart.

ELECTION OF OFFICERS.—CROWN POINT MINING CO.—Trustees: J. D. Fry, Thomas Bell, A. Hayward, Thos. Sunderland and R. Sherwood; President, J. D. Fry; Secretary, Charles Elliot; Superintendent, Thomas C. Taylor.

THE SUBMERGED PUMP AS A HYDRAULIC PROPELLER.—The American submerged pump, which was lately described in this paper, is adapted to other uses than those mentioned in a previous article, as will be seen from the following statement:

In one of Admiral Farragut's letters, describing his visit to England, is an account of the Ruthven hydraulic propeller, which has been applied to an English iron-clad of 700 tons, the *Water Witch*. This propeller, as it is termed, is very different from the invention generally known by that name. Water rises from below into a box, whence a rotary pump, worked by steam, throws it with great violence into two square boxes placed on the outside of the vessel, one on each side, nearly amidships, and about the water-line. These boxes are square tubes, ten or twelve feet long, and twelve inches in diameter, open at both ends. Near the center is a valve, under the control of the officer of the deck, and as he turns it, the water is thrown with great force, either forward or aft, thus propelling the vessel either ahead or astern, at his will. The Admiral took a trip in the *Water Witch*, and was surprised to find that she sailed at a speed of seven miles an hour against a fresh breeze and quite a sea, and under more favorable circumstances made nine knots an hour. There was no interruption of the machinery, and the movements of the vessel were wholly controlled by the officer of the deck, who, by working the valves spoken of, can go ahead, back astern, or turn the vessel on her center. The Admiral says that on her return she was kept at a speed of nine knots till within fifty or sixty yards of the wharf, when she was suddenly checked, and brought to her landing with infinitely more ease than any steamer he ever saw. About a year before the Admiral's visit, the same steamer was tried with plunger pumps, and made, with them, fifteen knots an hour. But the packing of the pistons would not stand the strain, and as they were liable to get choked at sea, they were replaced by the rotary pumps, which required more power and gave less speed. The American submerged pump would, however, answer all the requirements of this propeller, and the absence of all packing would remove one of the drawbacks which necessitated a change of pumps, even at the expense of a serious loss of power, in the *Water Witch*.—*Times*.

A SKILLFUL OCULIST.—It affords us pleasure to mention the success which has for the past few months attended the practice of Dr. D. R. Morgan, of San Francisco. We have had occasion to speak of several remarkable cures effected by this gentleman, before, and we have recently seen several patients of his, some of them fully recovered, and others partially restored from total blindness, from which they had sought relief in vain, through other practitioners, among which we may mention the case of Mrs. Jane Young, of Virginia City, who was for several months under the care of an able physician at Sacramento. She was afflicted with very sore eyes for about eight months, and much of the time was unable to see anything. We saw her after sixteen applications by Dr. Morgan, with sight sufficiently restored to read coarse print, and the eyes fast regaining their healthful luster. She is also recovering her hearing, which had been lost to all ordinary sounds.

William H. Casson, of Nevada City, a boy of thirteen, had a total eclipse of one eye, and could see but little from the other. After five weeks' treatment he had recovered sufficiently to read the bill of fare at the International Hotel, printed in nonpareil. He was still under treatment. Mrs. Francis, of Santa Cruz, was another case of total blindness, extending over an afflictive period of twenty-one months, until hope and patience were both nearly exhausted. Her's was a case of very rapid recovery, and a great cause of rejoicing with herself and family.

We do not, in mentioning these remarkable cures, wish to convey the impression that all his cases result so happily, in such a brief space of time. Although we believe that the Doctor has had great success from the start, we do not claim the performance of miracles, but merely the application of great skill in the profession which the Doctor has taken up as a specialty, which covers an extended field of practice in this State in which physicians generally have not attained much success.—*Mountain Messenger*.

RAINFALL NIGHT AND MORNING.—It is stated as the result of careful experiments for six years at the Greenwich Observatory, that rain is more frequent between noon and midnight. The smallest rainfalls take place in the morning, as the sun is going up; the greatest in the afternoon, as the sun is setting.

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board.

SAN FRANCISCO, SATURDAY MORNING,
JUNE 6, 1868.

Financial.

It is too soon yet to enter upon any calculation as to the volume of money that will be required to move the maturing crops. Some have expressed a doubt of there being coin enough for this purpose, without seriously embarrassing other commercial relations; but we can see no good ground to predict such a result. The crops will undoubtedly be the largest ever raised in California; but we believe they have been, in some cases, largely over-estimated. Should they, however, realize to the fullest extent the estimates made, they will probably be moved without serious detriment to other business.

Money is in abundant supply, notwithstanding the reported heavy shipments made via Panama and to Oriental countries. Legitimate business wants find ready accommodation, in bank, at 1 1/4 to 1 1/2 per cent. Large loans, upon real estate securities, are effected readily at 10 to 12 per cent. per annum. Our savings and loan institutions continue to augment their deposits, in the face of a brisk demand. Those recently established in this city, as well as in several of our interior towns, are doing as well as can be expected under the large accommodations furnished. Bullion is in moderate supply, and is quotable at \$800.000 for gold bars; silver bars are variously given, from par to 1/4 and 1/2 per cent. premium. Currency bills on Atlantic cities are worth 37 to 38 per cent. premium on gold; sight drafts, payable in coin, 1/4 to 1/2 per cent. premium; telegraphic transfers, 10 to 14 per cent.; sterling exchange, 48 1/2 to 49 1/2; commercial exchange, 49 1/2; Mexican dollars, 4 1/2 to 5 per cent. premium; exchange on Paris, 5 francs for 30 days.

The real estate transactions for May last were \$654,893 in advance of those for the same month in 1867. Sales were lively, but with less of the speculative movement which characterized the months of January, February and March. The total amount of money which changed hands last month was \$2,107,263, being a decrease of \$257,094. The number of sales made was 522, being 171 less than in April, and 209 less than in March. The sales made so far, each month this year, according to *Carlier's Circular*, have been as follows:

Month.	Sales.	Value.
January.	433	\$1,713,597
February.	514	2,340,000
March.	731	3,825,943
April.	693	3,943,262
May.	522	2,107,263

It will be seen that since January 1st, 1868, no less than 2,993 sales of real estate were effected in this city, and that the enormous amount of eleven and a half millions of dollars changed hands.

The number and value of mortgages and releases for the same period will be found in the subjoined tables:

Month.	Mortgages.	Value.
January.	205	\$914,293
February.	252	982,012
March.	293	1,325,263
April.	267	1,022,752
May.	260	906,270

Month.	Releases.	Value.
January.	1287	\$1,610,810
February.	1268	1,118,535
March.	1283	607,320
April.	1196	498,494
May.	1174	529,463

For a city of 134,000 inhabitants, the foregoing figures show an unmistakable liveliness in the real estate market. We are pleased to note that there is a greater tendency to embark capital in enterprises of a legitimate character, outside the city, with the view of improving the country and developing its resources, instead of investing in real estate speculative transactions, in the hope of more speedy returns. The far-sighted man of business comprehends that the value of real estate in and around San Francisco must depend wholly upon the progress, character, and value of her natural tributaries. Vigorous efforts are still being made to clear up titles, and dispose of those which have nothing better to recommend them than the efferonery with which they have been urged as valid. The new system of selling homestead lots for a small amount paid down, and the balance payable in moderate monthly instalments, is productive of much good. Persons never before noted for economical characteristics, have been induced to embark in these purchases, and, in course of time, will come into possession of valuable real estate property. This is a pleasing and easy manner of inculcating habits of thrift and economy, and will produce good fruit in a moral as well as substantial way.

City Stocks.

A few shares of Union Insurance Company stock sold at \$89 per share; Spring Valley Water at \$68 to \$67, and California Steam Navigation Company at 69 1/2 to 69 3/4 cent, and 70 to 71. The Gas Company paid its usual monthly dividend on the 1st inst., and the Pacific Bank 1 per cent. on the same date. A special meeting of the stockholders of the National Insurance Company will be held on Friday, June 12th, at 1 o'clock, for the purpose of considering and voting upon the question of dissolving and reincorporating. For Home Mutual Insurance Company stock \$19.60 has been offered. It is the intention to re-organize this company with a paid up capital of \$200,000.

Mining Share Market.

The mining share market has been somewhat inactive since our last reference, and the sales have fallen off considerably in volume. There is a lack of animation throughout the whole list, and transactions generally exhibit more than usual variation, in most instances showing a recession from former prices. Many look for a reaction in the course of several weeks, and this we may expect, judging from the present sphy and unusual dullness in this class of stocks. Under the present aspect of the market, speculation has received a check, and outsiders, for the moment, have in a great measure ceased investing.

The Assessor of Storey county, Nevada, for the first quarter of 1868, returns the product of twelve claims on

the Centstock lode to be 45,435 tons of ore, valued at \$1,334,983. If we compare this aggregate with our quarterly statement published in April, wherein seven companies in January report a product of \$411,016, nine in February, \$431,333, and ten in March, \$711,097, total, \$1,554,016, we find a difference of nearly \$250,000, and in this exhibit in no single month do we give the returns of twelve companies. The same authority states the yield of seventeen companies, during the quarter ending December 31, 1867, to be 94,912 tons of ore, showing an aggregate product of \$2,458,392.

By resolution of the San Francisco Stock and Exchange Board, adopted on the 1st inst., all stocks will be hereafter sold and quoted by the share.

Justice and Independent Company levied an assessment of \$5 per share on the 26th of May, and Union \$5 per share on the 2d of June.

CROWN POINT—advanced from \$117 to \$124, declined to \$117, and closed at \$116 50. The bullion product for the month of May aggregates \$108,677, against \$169,074 in April. The expenses for the month just closed were about \$77,000. The mine continues to look well. Porphyry has made its appearance on the east side of the south drift, but it is thought to be only a bunch, and its pay ore is found on the east side of it; otherwise the face looks well. Later, by telegraph, we learn that less porphyry is now encountered. The drift is now 121 feet from the lode. From the annual report of the Superintendent of the Crown Point Mining Company, closing May 1, 1868, we learn that 25,888 tons of ore were extracted, as follows: From West Body, 18,392 tons; East Body, 166, 6,730; 600 level, 7,315; 700 level, 3,645; and 800 level, 166. "The bodies of ore on the 800 level," says the Superintendent, "are not sufficiently opened to form any estimate of the amount known to exist in the three different strata. Between the 500 and 700 levels we can safely count on between six and seven thousand tons now in place, in east and west bodies, and numerous others that will not be included." From the Secretary's annual report for the year ending May 1, 1868, we make the following extracts:

RECEIPTS.	
Cash on hand, May 1, 1867.	\$57,051 30
Bullion.	886,028 60
Assessment.	60,000 00
Other receipts.	25,115 14
	\$1,006,195 04

DISBURSEMENTS.	
Dividends.	\$48,000 00
Mining expense.	240,744 34
Milling expense—company.	162,116 27
Milling expense—outsider.	115,941 57
Legal expense.	79,394 18
Mine improvement.	17,851 97
Mine improvement.	86,212 03
Salaries, office rent, etc.	10,400 00
Taxes, assaying, etc.	31,459 67
Cash in Treasury, May 1, 1868.	127,682 53
	\$1,008,195 01

The cash on hand is \$76,631 25 in excess of previous year; bullion receipts \$381,999 87 less. Including an assessment of \$60,000, the entire receipts show a diminution of \$348,117 18 as compared with last annual statement. In the previous fiscal year the dividends amounted to \$372,000 against \$48,000 disbursed during the year just closed. There were 25,964 tons of ore reduced, making the average yield per ton for the entire year, \$33 35. The average cost of reduction has been as follows: 14,184 tons at Rhode Island mill, \$31 52 per ton; 11,773 tons at Santa Clara mill, \$34 70, 6 1/2 tons at Ophir mill, \$46. The cost of mining 25,964 tons was \$9 85 per ton against 34,750 tons at \$7 60 in the previous year. The assets are stated to be \$294,765. This company will probably declare a dividend of \$7 50 per share, or \$150 per foot, and will be made payable on and after the 12th inst.

KENTUCK—In slight request, improving from \$416 50 to \$430, and closing at \$410. Bullion receipts for May account aggregate about \$109,000, and the expenses for same month are estimated at \$62,000. A dividend of \$30 per share is payable on and after the 10th inst.

SAVAGE—sold at \$150 50 to \$157 00, then at \$165, and closed at \$160. During the week ending May 30th, 1,550 tons of ore were extracted, showing an approximate value of \$60,000. The entire mine, on the fourth station, contributed 913 tons of the above amount. The estimated profits of the ore extracted during the past four weeks, as per weekly statements, amount to \$106,277. The west streak in the third station north is said to open out well, and extends down at least fifty feet below the old seventh station. The Potosi chimney on same level has yielded eleven tons of first-class ore during the week under review, and the fourth station continues to improve in raising, showing already a considerable body of ore. In the south mine, same level, the breasts are looking better than before. In the north drift, fifth station, much trouble is experienced on account of broken quartz and water. The south drift, same level, is reported to be in good ore, and the breast just opening looks better than it did the previous week. Sinking of shaft has been stopped, in order to re timber it, and it will probably take a month before the sixth station will be opened.

CHOLLAR-POTOSI—exhibited a very marked advance, rising from \$244 to \$285, declining to \$260, advancing to \$287 50 and closing at \$286. The bullion product of the mine amounted to \$64,839 75 against \$46,676 in April. During the week ending May 29th, 893 1/2 tons of ore were sent to custom mills; 717 tons were extracted from the Blue Wing level same time. In the new shaft the incline has been advanced twenty-five feet during the week, and should the rock work as well as at present, they expect to have it deep enough in the course of a week to place timber at the 1,100-foot station—vertical measurement from mouth of shaft.

AMADOR—sold at \$287 60 to \$290. The May receipts of bullion amounted to \$44,251 80 against \$42,412 in April. A dividend of \$10 per share will be paid on the 20th inst. GOLD HILL QUARTZ sold at \$120. The bullion receipts for May aggregate \$11,066 10 against \$9,736 81 in April.

INTERNAL—was in slight request, selling at \$208 to \$195, and closing at \$196. The lower drift now runs in tough clay and porphyry, and they are advancing at the rate of four feet per day. LADY BRYAN sold at fluctuating rates, closing at \$33. Dispatches of the 4th inst., state that the injunction would come up for argument on the following day.

The sales in the Board during the past week have been as follows: Regular sessions, \$1,307,686; open sessions, \$452,118—total, \$1,859,804. In May the sales amounted to \$10,162,396, and for the first five months of the current year \$52,290,370 against \$24,247,002 same time in 1867.

EXCELSIOR!—Still higher is over the cry of the true artist, who, not content with mere mediocrity, aims ever to reach the highest walks of his profession. In adopting this motto for their splendid new Photographic Gallery at No. 649 Clay street, Mr. J. R. Mains, and his partner, Mr. McCabe, have shown to the public upon what plan they intend to conduct. Every style of photographic picture is there obtainable, made in the best and most tasteful style of the art, and at very reasonable prices. But it is only necessary to mention that the well-known and popular J. R. Mains is the operator, and the public know the rest themselves and will seek him at once.—*Golden Era.*

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

Alpine County.

Miner, May 30th: The old Whitesides Mill has passed into the hands of the Pittsburg Company. Mr. Thompson, the superintendent, has offered the I X L Company to work their ores at \$12 per ton, with the calculation that this, with the ore the Pittsburg's own mine will now furnish, will keep the mill running.

On Monday the mine of the Buckeye No. 2 Company was sold at Sheriff's sale to D. C. Riddell for something over \$2,000.

M. C. M. Co.—Nearly 50 feet of drift has been made on the ledge this month. The ore looks very well.

Amador County.

Dispatch, May 30th: The Casco mine situated in Hunt's Gulch, has been purchased by Messrs. Haley & Co. for \$6,000. The shaft is 10 ft. by four in the clear, is now down 265 ft., and is still being sunk at the rate of two ft. per day.

The lower south level in the Coney-Biglow mine is now in 40 ft. and the vein is 12 ft. wide. The upper north level is over 140 ft., with a vein 20 ft. wide. The rock in these levels, we learn, is richer than any that has been found in the mine heretofore.

Calaveras County.

Chronicle, May 30th: Mr. Said, manager of the "Petticoat" mine at Railroad Flat, has leased the mill of Hephurn & Co. for one year. Work is being pushed rapidly forward, with flattering prospects.

The Centre House mine, near the Junction, Chili Gulch, has been prospected so far as to warrant its owners in putting upon it a mill. The work in the shaft is continued night and day.

Inyo County.

Territorial Enterprise, May 27th: We were yesterday shown a large lot of very fine specimens of silver ore from a number of different leads in Cerro Gordo District by Dr. James Delevan, who spent the past winter in that region. The ores contain a considerable amount of copper and lead, with much silver. As yet the furnaces in use are very small and rude affairs, but some large and well-constructed furnaces will soon be in operation. The leads yield paying ore from the top, and there is no prospecting after supposed rich deposits. Dr. Delevan will return in a few days to the mines, taking with him tools and supplies for the mines in which he is interested—the Cerro Gordo, Mexican, and others. The majority of the miners now in the district are Mexicans.

Kern County.

Havilah Courier, May 23d: We saw a few evenings since a gold brick, value, \$465.51, which was made out of rock from the Rip Van Winkle lode, Keyesville District, owned by Fritz & Bernard.

The New York and Clear Creek Mining Co. are about to resume work on the Cape Horn claim.

Letter from Kernville: The claims of Ellsworth & De Land and Hutton & Co., are yielding very rich ore. Ellsworth & Co.'s mill is running again. Their shaft is down about 300 ft., and prospects well. Mr. Odors, about a mile above the old mill, has some very rich lodes, which he has begun to work in earnest. He made a run with his arastras last week, which yielded over \$100 to the ton. The old placer mines near Keyesville, are being worked to a considerable extent, and are paying well. Fritz Bros. & Co. are working a quartz lode near Keyesville which is from two to three ft. wide, and pays from \$50 to \$80 to the ton. The rock is crushed on Dick Scott's arastras.

Los Angeles County.

Star, May 16th: Soledad, once the scene of active operations in copper, is again attracting attention in silver and gold mining. Messrs. Searles & Yates are constructing arastras; these are miners of great experience, and they have the most sanguine hopes in their ultimate success. Polk & Kabler are now running the mills of Mr. McMurtry, and are realizing handsome returns. Scott & Edgerton have four horse arastras running, with every prospect of success.

Nevada County.

Transcript, May 28th: The Buckeye Co., at Sweetland, owned by Evans, Stiger, & Co. is paying big dividends to its owners. The American Co. at Sebastopol, are taking out an immense amount of gold. The claims are paying \$75 per day to one-eighth interest. All the claims along the ridge are paying splendidly. The Wyoming, Ohio, and Golden Gate companies, at

North San Juan are taking out lots of gold. The Eureka Co. has started up again after lying idle about two years, and the prospect is very good. It is estimated that over \$1,000,000 has been taken out of these claims and the largest clean up was about \$10,000. The mine was or is owned by San Franciscans, and they stopped work on it two years ago because it did not pay well. There were two gold bricks at Furth's hanking house, North San Juan, on Tuesday last, worth about \$20,000, which came from the diggings in the neighborhood. Business is better along the ridges than it has been in two years.

Same of 31st: From a gentleman who came from Red Dog yesterday we learn that a lump of quartz and gold was found in the diggings of Clipstine & Co., at Remington Hill, on Thursday last, which weighed 240 lbs. Our informant says it is estimated that it will yield not less than \$20,000.

A lot of mining ground, consisting of ff y c'aims of 40 by 250 feet each, was sold a few days ago by Martin Janch to John B. Hunter for the sum of \$17,500.

Same of June 30th: Considerable mining is now being done in the vicinity of Washington, and the miners are doing first rate.

Gazette, 29th: The Cold Spring and Fountain Head companies, on the Washington ridge, three or four miles above Nevada, are making arrangements to commence working. The companies have joined together and surveyed a ditch, connecting with the South Yuba Canal, near the Central House, and extending down to the Cold Spring claims. The ditch will be about five miles in length. Men are already at work digging the ditch.

Jacobs & Sargent cleaned up \$1,675 yesterday, after a twelve days run, in their Railroad claims at Quaker Hill.

Same of June 3d: We were informed in Grass Valley, on Tuesday, that the old Rocky Bar mine (in which the brothers Watt laid the foundations of their fortunes,) will be started up next week under the superintendence of A. B. Brady. Also, that there is every prospect of work being speedily resumed in the Allison Ranch mine.

Grass Valley Union, May 28th: The Red Jacket mine is located on the north side of Deer Creek, about one mile below the Anthony House. About 18 months ago W. M. Pearl and others, residents of Timbuctoo and Smartsville, took it into their heads that the site of the Red Jacket mine had deep down under it the celebrated Smartsville lead of blue gravel. A company was organized and work at once commenced. A letter from Judge Pearl, dated at the mine, on the 24th inst., says: "The problem as to whether the Red Jacket Mining Co. is worth anything or not, is solved. We have found a large deposit of 'blue cement,' equal in richness, to all appearance, to the cement claims of Smartsville."

The owners of what was lately known as the Lucky Mine, were incorporated on Wednesday last, under the name of the Howard Hill Mining Co.

The Idaho Co. a few days since struck the ledge in the shaft, at 40 feet below the 300 foot level. This strike shows pretty conclusively that the Idaho Co. are on the east extension of the Eureka ledge. The quartz resembles that of the Eureka mine in every particular.

Grass Valley National, May 29th: In the Doomsday mine since 9 o'clock Tuesday morning, the water has been reduced in the incline 160 feet, including the vast quantity in the first level. Some few timberers have given away, but generally speaking the mine has suffered but little by being filled with water a month or two. Work will be resumed in the first level on Monday.

Same of June 1st: We visited the North Star mine on Saturday. The company are taking out from 40 to 80 tons of rock per day. In the sixth level, east, the ledge has been drifted upon for about 300 feet, and is from two to three feet thick. We have seen ore before, but nothing to compare in beauty and richness, both in gold and sulphurets, to that we saw in this level. In this and the other levels there is all of ten years work in sight. Chlorination works are in contemplation. The mine has yielded about \$10,000 in rich specimen rock within ten days past.

EXCELSIOR.—Nevada Transcript, of May 29th: By a letter we received from Carlisle we learn that matters are beginning to look up in that region. The Kentucky claims, located on the Ohio ledge, Old Man Mountain, adjoining the Grant mine, and for the past eight months under the Superintendence of Mr. Wood, has a tunnel 218 feet, and in addition they have run a cut 80 feet, tapping the ledge, which shows itself well defined, and though cut a distance of eight feet, not yet through. The mine is opened

by the tunnel 150 feet. The shaft which is to intersect this tunnel was sunk 40 feet last fall, and it will now be pushed forward. The annual meeting of the stockholders will soon be held, when they will decide whether to build machinery and a mill this season. The Kentucky Co. have expended some \$12,000.

Placer County.

Dutch Flat Enquirer, May 3d: We have this week heard several parties inquiring for miners to work their hydraulic claims, but we are informed that they are not to be had in this vicinity.

Nevada Gazette, May 2d: The quartz mill of the Rising Sun Company, near Colfax, has been completed, and was started in operation a week ago Monday. A friend at Colfax informs us that after a run of four and a half days, they cleaned up the amalgamator and obtained \$905. This was in addition to what may have been saved in the battery, which has not yet been cleaned up. A crushing of rock from the Rising Sun mine, at the Gold Hill mill in Grass Valley, gave a favorable return, and the mine is managed and partly owned by experienced Grass Valley miners.

Plumas County.

Quincy National, May 30th: The Crescent mill is only running sixteen stamps at present. The mine is full of water, and the mill is running on rock taken from the upper level. The Whitney mill and mine is utterly deserted—no one at work there.

San Bernardino County.

Guardian, May 30th: For more than one year past the great quartz lodes of Holcomb Valley have been effectually stopped by litigation, and from present appearances it will be some time before they settle their difficulties and resume operations. On the Green Lode work has also been suspended. The placer mines, however, of Holcomb Valley, are being worked by about forty men. A steam pump is employed by Mr. Charles Farciot, and all are making fair compensating wages, with a prospect of doing better as the high waters subside. Recent advices from Lytle Creek show that new placers have been discovered, that are paying from fifty to eighty dollars per day to the four men engaged in working them; also in Swartout's Pass new placers are being worked at paying rates by Sonoranians.

Sierra County.

Downieville Messenger, May 30th: A. M. Sackett has bought 100 tons of quartz from the claim of Johnson & Gardner [extension of the Docile] at Alleghany, and is now mining it out with a view to crushing it in the Docile mill. It is reported that the rock already taken out is very rich.

After years of labor, the Gold Bluff boys have at last got on the track of their ledge in the lower level, and will probably reach pay in a comparatively short time.

It is rumored that rich rock has been struck in a lower tunnel being run at the Docile.

J. and R. Hainer have taken a contract to run 250 ft. of tunnel in the Good Hope claim for \$1,250—\$5 per ft.

La Porte letter says: Mining has commenced and is steadily progressing in all of the best hydraulic claims in this vicinity, and it promises well for a mining season.

Siskiyou County.

Yreka Union, May 30th: On Humbug the miners generally have their claims open and are getting good pay. At Mugginsville the miners are doing a great deal of work with good prospects. Moore & Grooms have washed a small piece of ground and received good pay. At Etna the work in opening the claims through the flats is progressing satisfactorily, and good prospects are obtained. Work has been resumed on the "Steamboat" claim on McAdam's Creek. This summer water power, instead of steam, will be used for running the pumps and hoisting the dirt.

Tulame County.

Sonora Democrat, May 30th: A gentleman from Jamestown informs us that marvelously rich rock is being taken out of the Croesus mine, and that the further it is opened the better it looks. The machinery for a ten stamp mill is already on the ground. In putting it up things will be arranged for an addition of ten more stamps.

ARIZONA.

Prescott Miner, May 16th: Last week Little & Taylor of Lower Lynx creek, after five days' run, with three hands, cleaned up their sluice boxes, and got \$150. Miller & Co.,—three men—took out of the England gulch, last week, \$150. Two Mexicans, who came here recently from Weaver, took out of this gulch in one half day over half an ounce. They washed the dirt in a rocker. George Niox has a sluice claim on Upper Lynx creek which pays him about \$5 a day. The placer miners on the Has-

sayampa are making fair wages. The Aztan mill is running upon Chase rock. McWilliams & Smith have been flooded out of their claim in the vicinity of the Tanks. They will resume operations so soon as the water decreases. We learn that it is the intention of some of our miners to pay a visit to Black Cañon soon, and prospect with a view to working it with hydraulic process. On Big Bug all the companies now at work, some four or five, are making from \$4 to \$12 a day. Considerable gold is being taken out of the placers at Weaver Hill, and in the vicinity of the Vulture mine. D. R. Poland came down from Walker's District yesterday. The arastras were running. In Turkey Creek District the shaft on the Gross lode was down 10 ft., and prospects were good. Indians were plenty, and work, fear, will have to be suspended. In Wickenburg District, both mills are now at work. The new silver ledge recently discovered northeast of Wickenburg is being prospected. The vein is narrow, but the lode is well defined, and can be traced for miles. R. W. Groom has found another rich silver ledge 15 miles below Wickenburg. He will sink a shaft upon it. The Wickenburg and La Paz people are greatly excited over the new mine recently discovered near Black Tanks. The ledge has been located for miles, and is being worked by several companies. It is said to be richer and larger than the Vulture. Henry Wickenburg and W. P. Smith are hauling rock to their mill at Wickenburg, to crush and test it. In Big Bug District, Mr. Gray will soon start his mill.

COLORADO.

Herald, May 13th: The Ophir Co.'s mill started up yesterday. B. C. Waterman has the Philadelphia mill all ready to run on custom ore. Charley Aldrich has 14 of the Kenyon G. M. Co.'s Bertola pans running on blanket tailings. He has purchased of Mr. Fitzpatrick the "clean up," in and around his 8-stamp mill. The miners on North Clear Creek, below Black Hawk, as a general thing are making money. J. D. Nash is running the Sensitive mill on custom ore. Mat. France gave us a couple of specimens of ore from the "Brown" yesterday, which are perfectly splendid. The ore, upon close inspection, is found to be full of ruby and brittle silver. The Herkimer lode is opening out splendidly. The mine now shows 15 inches of rich ore besides a good show of second quality. Mr. E. C. Beach has been managing the Briggs' mining property. Today he deposited a solid chunk of gold weighing 53 lbs. 10 oz. 10 pwt., troy, the result of his labor for the month of April. The value is \$15,000 in currency. The cost of the reduction was \$7,000.

Register, May 14th: Mining matters are materially improving. Yesterday Warren Hussey & Co yesterday shipped 260 ozs., as the result of their small purchases during the week. Placer mines long idle are now being worked with profit.

Georgetown Miner, May 14th: From the shaft of the Equator, about 100 feet deep, there was taken out one day last week, 1,200 pounds of ore, scarcely a specimen of which does not carry "wire" native silver in abundance. At the bottom of the shaft, there is 12 inches of this native silver-bearing ore. In the Winnebago lode, a few hundred feet north, the same kind of ore in considerable quantity has been discovered. In the Herkimer lode, a new pocket of splendid looking ore was opened last week. The Sonora lode is now in splendid condition. It has been opened by two adits, one about 50 ft. above the other. A shaft has been sunk connecting them.

On Thursday last the largest ingot of silver hullion ever produced in this Territory was taken off at the Georgetown smelting works. It weighed 260 lbs., troy, or 3,120 troy ounces, coin value \$4,242.20, currency value \$5,516.16. This product was from nine tons of first class ore and two tons of low grade galena ore, which gave, by average assay, less than \$50 in silver to the ton. Notwithstanding the low yield of this two tones, the average yield on the 11 tons is \$382.75 in silver, coin value, to the ton of ore. This amount of silver was taken out in five days' run.

DACOTAH.

Colorado Register, May 14th: H. Tadder, a good prospector and reliable man, writes from Atlantic City, April 5th: I have prospected the rock from the Atlantic ledge thoroughly; if it was in Colorado it would not pay for crushing. The Miner's Delight has a two foot crevice and shows free gold. The deepest shaft is 10 ft. I think the ore will pay about \$500 per cord. The Creaser will probably pay expenses. The Lone Star State prospects about \$60 per cord, has a two foot crevice, and a shaft about 20 feet deep. This includes all the important

ledges in this country. Rock Creek has about 600 inches of water, and has been slightly prospected. We get from half a cent up to ten cents to the pan. About 400 claims have been taken. Only one claim is opened. The owners have three joints of sluice; they make about \$5 per day. After looking over this country for ten days, I must say that I am very much disappointed in the prospects.

On the 18th he writes: Hundreds are now arriving from Montana and the western mines. They seem very much dissatisfied, and quite a number are leaving here for Colorado.

IDAHO.

Owyhee *Avalanche*, May 23d: The Golden Chariot Co. was robbed of about \$6,000 in crude bullion on the night of the 20th at their mill on Sinker Creek. It was taken from the retort.

Letter from Flint District: The Rising Star Ledge is 20 feet wide in the upper level, the whole width, with the exception of a small horse in the middle, containing good millage ore, and much of it immensely rich. There are about six tons of "first class" that will work over \$800 per ton, and about 90 tons assaying at least \$175 per ton.

Lewiston *Journal*, May 9th: During the last week there has quite a large number of persons left here for Warren's, Elk City and Pierce City. Every one feels confident that the quartz interest of Warren's and other camps is to be developed this season.

Idaho *World*, May 20th: As the season advances the show for a prosperous mining year is better and better assured. Water is becoming more plentiful, and the late rains have added much to the volumes furnished by the ditches. The creeks are as full as in former years, and all about the Basin the miners are generally very profitably employed.

World, May 23d: The late rains have furnished water to many, and we learn that on the high mountain tops the fall of snow within the past fortnight has been so plentiful as to assure a good supply of water in some of the ditches until late in the ensuing fall. The prospects are that this will prove about as lengthy and profitable a mining year as any which has gone before it in Idaho. Nearly all the claims are being busily worked.

Letter to same from Deadwood: Nearly all the locators here are doing better than they expected. Judgo Gray's Co. are doing very well. The Dutch claim has paid at the rate of \$25 a day to the hand for the last three weeks, and promises to keep up this lick for the season. Mr. Reed is making good wages in the same gulch. Comromise Gulch has prospected rich wherever tried, but there is no water in it yet. Two men took out \$70 one day last week there, with one rocker. Hyland's diggings on Horso Fly Flat, are good. He has not yet made a clean up. Jackson offered one of the shareholders \$1,000 cash for one-fifth of 1,500 feet, and the man lunched at him. Wright & Co. have three claims in Keystone Gulch, from which they are taking out lots of dust. Water is cheap, everything considered—65 cents for day and night. Emery Gulch is good. Three companies are at work in it, and are all doing well. Elwood Gulch also pays. Madden & McIntosh have not cleaned up yet. Boulder Gulch, I hear, pays well. Bill Houton is making plenty of money out of his hill ground, and I hear his partner has refused \$1,000 for one-third of three claims. Bill Hupper has found a quartz vein which crops out exceedingly well, and a lot of the rock, which he treated by a simple rough process last Saturday, yielded 62 ounces to the ton. It is situated in or crosses Keystone Gulch, near the head.

MONTANA.

Helena *Post*, May 16th: Gulch diggings have recently been struck on a tributary of Lump Gulch.

A clean up of \$3,600 was made on Sunday from a four days' run upon Cable Rock in the Nowlan & Plaisted mill at Cable.

Prospects in Bannack for the summer are flattering. Roe & Co's ditch has been opened, and hydraulicing commenced. The quartz mills are being put in order, except Col. Wood's, which is sending forth a 15 pound brick every week.

On Taylor, Thompson & Co's claim, Last Chance Gulch, a 10-horse-power engine hauls two cars on separate tracks, 135 ft. long, up a grade of 33 ft. to 100. The average hourly number of car loads of 1,500 each, is 32. Twenty hands are employed.

At the Crow Creek mines the big ditch is now complete, and work has commenced in earnest, with satisfactory results. Radersburg is the liveliest mining center of its size in the Territory.

The small gulches in the vicinity of Bear are paying remarkably well where water can be obtained. At the head of Deep Gulch,

six miles distant from Bear, eight to ten claims are yielding enormously during the few hours that they are worked each day, the runs ranging from \$7 to \$75 per hour, with from four to five men shoveling in. It is, however, impossible to obtain water for more than three or four hours per day.

On Lincoln Gulch there are 108 claims located, 17 of which are yielding large quantities of the precious metal. The ground prospects from 15 to 40 cents to the pan. A clean-up of \$1,100 was recently made from a 10 hours' run on claim No. 5, four men being engaged in shoveling. There are 500 men in the camp.

Letter from Philipsburg: The St. Louis & Montana Mining Co. have been running a tunnel for the purpose of striking the Hope lead at a depth of 175 feet. This tunnel takes its start at the bottom of a shaft over 100 feet in depth, and is already nearly 200 feet in length.

Work on the Comanche lode is progressing finely at four different points. The Mountain Queen, Apache, and Freeman lodes are being developed with satisfactory results. Upon the latter there is a shaft, 100 ft. in depth, showing a well-defined ledge. Bell & Kidder have a tunnel 100 ft. in length on the Pride of the Mountain.

Mr. Philip Deidsheimer is daily expected here with a mill from California or Nevada, and still other mills are expected from the East by some of the first boats coming up the river.

Virginia items: Messrs. Hall & Spaulding have resumed work on their quartz mill, upon Meadow Creek. The machinery is to be a 10 stamp California mill. It left Sioux City April 20th for this place via the river.

From Highland we learn that the Nevins boys have resumed work with their astras.

Mr. Plattner's astras, on Brown's Gulch, has started up with rock from the Black Lode.

NEVADA.

Pahranaagat.

The Stockton *Independent* of May 30th, has a letter from Salt Marsh, from which we quote: The mines never looked more prosperous than at present in the Hot Creek district. Since the Domition mill was burned, several claims have struck the finest quality of ore, and in sufficient quantities to justify the erection of a first-class custom mill. Rattlesnake Cañon, six miles south of Hot Creek, is attracting the attention of capitalists, and there can be but little doubt that the miners will have facilities for working their rich ores before the close of the summer.

Moray, 15 miles north of Hot Creek, has some very rich mines. Those that have been brought into notice by their rich yield of silver, belong to Messrs. Hall & Co. Their ore paid the best average of any rock that was worked at the Old Dominion mill—a large portion running over \$250 to the ton. I have not seen a locality in the State where the facilities for working the mines were so convenient—wood, water and ore all in and on the same mill, and only 35 miles from the greatest abundance of salt. The claims that have been worked by this company have paid well from the top. I saw the most beautiful specimens of ruby ore, taken from a depth of only 70 ft. from the surface. The ledges average from one to three ft. in width. It is expected a mill will be erected at Moray during the summer.

Pahranaagat district has awakened from the causes which had almost depopulated the district. A fine 10-stamp mill has been built at Hiko, 12 miles from the mines, and is running to the satisfaction of all parties interested. The bullion the mill is turning out is of a fine grade, running as high as \$89. The last ore worked averaged \$150 to the ton. At Crescent City a 10-stamp mill is now in process of erection. The list lode is yielding eight to ten tons of milling ore per day. A company at Logan is erecting a smelting furnace for the purpose of working the Galeua ore, of which there is the greatest abundance in that vicinity.

Humboldt.

Register, May 30th: The vein of the Arizona Consolidated Silver Mining Co. is three feet wide at the end of the drift, and the ore is worth \$200 per ton. The company is now sinking a shaft, through which to hoist the ore.

Mr. Guaca has secured Holt's mill, at Winnemucca, and intends to run it this summer on ore from the Winnemucca mines, some two or three miles north of the town.

The De Soto mine is said to look better than ever. The Almira ditto, with plenty of ore in sight; still the Eastern owners are doing nothing.

Messrs. Godshalk and Shupe, from Bucks County, Penn., who have been examining our mines, while rambling over our mountains discovered a very fine vein of quartz, only half a mile above town.

Gov. Fall is now doing a rushing business on the Arizona mill, his new mill, having employed every available carpenter in the county. It will soon be completed and in running order.

Reese River.

Silver Bend *Reporter*, May 23d: For several weeks past the Combination mill has been undergoing salutary changes. The entire battery of 40 stamps now runs with a greatly increased speed; all of the 32 amalgamating pans, and the 16 large settlers are steadily performing their work; the reverberatory furnaces are in splendid trim and no poisonous fumes now stifle the breath of the operatives. Three or four teams are constantly delivering ore, 30 to 35 tons of which is manipulated daily. It is estimated that the bullion product of this mill for the next twenty days will exceed \$50,000.

We now have three quartz mills clattering away upon the rich ores of the district—the Combination with its 40 stamps; the Belmont with 10 stamps; and the Borques mill with its three stamps—53 in all. A furnace for chloridizing is to be built in connection with the latter.

The continued rain has retarded operations upon the Silver Queen ledge. An assay of a selected piece of ore gave \$481.74 silver to the ton.

The richness of the extensive deposit of chlorido ore in the vein of Leon & Co's El Dorado South was not known until recently. Several tons sent to Austin yielded about \$500 per ton. Hereafter it will be worked here and will not be so closely sorted, but will probably work near \$300 per ton. The main incline sunk by the company shows that it is continuous to the lower depths of the works—over 100 ft. The extent of this immense bonanza upon the surface indicates that it is probably the most remarkable deposit of ore of equal quality ever disclosed in any mine of the State. It is easily mined and there are hundreds of tons in sight.

Hot Creek correspondence of same: The Wyoming ledge, at Rattlesnake Cañon, is still improving. At the depth of 30 ft. from the surface, the shaft is seven ft. in diameter and is entirely in pay ore. How much wider the ledge is cannot now be told, but the owners have started a drift from the present depth and intend to cut through to the south wall. At the bottom of the shaft the ore is discernably richer than at any point above—being literally a mass of black sulphuret, tied and held together with threads of native silver.

Reville, 29th: Mr. A. Pumpelly, who returned from Silver Peak a few days ago, informed us that the mill of the Silver Peak and Red Mountain Co. would not be opened before the first of July. The tramway, eight miles long, over which the ore is to be delivered from the mine to the mill was designed by Mr. J. E. Clayton, the mining engineer of the company, and is said to be very ingenious in its construction. The mill contains 20 ordinary stamps, and two novel steam stamps, which are estimated to possess a crushing force equal to 10 ordinary stamps.

Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

Territorial *Enterprise*, May 26th: Work has been resumed in the drifts of the Imperial-Empire shaft, the water having been reduced below the tracks in the drifts. The air-pump, used for forcing fresh air down the shaft and into the ends of the drifts, works exceedingly well. One tank, hoisting 600 gallons at each lift, is sufficient to keep the water down.

Same of 28th: The silver-lead ores of Galena District are at last to be worked at a profit. Smelting is necessary. Mr. McFarland is now extracting \$250 per ton in gold and silver—chiefly the latter—with the furnace which he has lately erected west of Washoe City.

We were yesterday shown a bag of bullion from the Malta mine, Argentine District, Washoe County, weighing 134.65 ounces, .971 fine in silver, and .022 fine in gold. The bar contains \$169.03 in silver, and \$61.23 in gold—total \$230.26—and was extracted from six tons of ore, showing a yield per ton of a fraction over \$38.39.

29th: The rich streak in the Cole mine has now widened out to two ft. in thickness, and is only stripped for a distance of ten or 12 ft. This whole deposit is exceedingly rich in gold and silver. Our party dug out several pounds of the ore, and on taking it outside of the mine and washing it off, gold was to be seen in nearly every piece. An assay of ore taken out of the center of this streak, yielded at the rate of \$2,508 per ton in gold and silver; another from a different part of the streak yielded \$1,600, and others well up in the

hundreds. The average of nine assays of ore taken out at random for a distance of 40 ft. along the lead, and outside of as well as within the newly discovered deposit, was \$461 per ton.

The Gould & Curry Co. are vigorously engaged in sinking the Bonner Shaft. The shaft will be put down until through the west wall of the lead before drifting is commenced.

The Crown Point Co. have commenced sinking their main shaft for the purpose of opening a new and deeper level.

Trespass, May 30th: In the Crown Point, work in the shaft continues; down 31 feet. The middle body of ore has improved most materially. South, 800-foot station, a magnificent body of ore has been developed. In Chollar-Potosi, about 800 tons of ore have been extracted during the week, nearly all of which has been taken from the old chambers of the Blue Wing station. The timbers for the 1,100 foot station are being put in position. At a depth of 1,200 ft. a drift will be commenced. The new machinery at the Justice is nearly completed. About 1,450 tons of ore has been taken from the Savago this week.

The following is a statement of the amount of bullion shipped or received for assay during the past week: By Wells, Fargo & Co., in this city, there were shipped 5,393 pounds of assayed bullion, valued at \$140,815.35. Gold Hill, 4,530 pounds, valued at \$124,319.68.

Yesterday a body of ore 10 inches wide, which will assay from \$35 to \$50, was cut in the Suro claim, about a mile from the city.

NEW MEXICO.

Santa Fe *Gazette*, May 9th: The result of 16 days' run of the mill at these mines has been between \$2,300 and \$2,500.

C. E. Cooley, Esq., of Tuerto or New Placeres mines, was in the city on Monday. He had with him specimens of gold. The only machinery in use, as yet, is the astras. We are assured that the tests which have been made are satisfactory. There is on this claim a smelting furnace for reducing copper. It is said to operate well.

Gulch mining is now being carried on quite extensively on the Tuerto grant. Several experienced miners from Arizona are making good wages, notwithstanding the scarcity of water.

Capt. Hubbell informs us that several claims have been taken up on the Magdalena Mountains, a few miles west of the town of Socorro. The ores are of gold, silver, and copper.

In consequence of the snow, work has not yet been begun at the Moreno Mines, but there is a large number of men waiting for the opening of the season.

OREGON.

Enterprise, 16th May: The copper recently found in Clackamas County by F. M. Shaver is turning out a magnificent affair. The locality is close by the Willamette, and just above it is a valuable bed of iron ore, equal to Oswego and quite as extensive.

Dallas *Mountaineer*, 23d: By the arrival of Mr. Edgar on Thursday, we learn that the people of John Day Valley and Canyon City are prospering. The mines are turning out their average amount of gold dust.

Jacksonville *Sentinel*, 23d: We were at the Occidental mill this week, and found everybody busy. Col. Drew has been running night and day for 13 days. The quartz, being crushed now is from Timber Gulch lead, and has the appearance of being very rich. The last run paid \$10 to the ton. The mill is in splendid running order.

A vein of decomposed quartz running across Kanaka Flat has been struck. From present indications the lead will pay fully as well as the Timber Gulch lead. The vein of quartz is between three and four ft.

At Sterling the claims are still panning out well. We hear of a number of claims paying an ounce a day to the hand.

We learn that new diggings have been struck between Rogue River and Galice Creek, that prospect well.

A THOUSAND MILES OF ROLLING STOCK.

The railway rolling stock of Great Britain, if ransed in line, would be headed by about 50 miles of locomotives and tenders, about 100 miles of carriages, and 850 miles of freight, gravel, cattle and miscellaneous cars. On the British railroads last year, the amount expended upon locomotive power was 27.93 per cent. of the working expenditure. For maintenance of way and works the expense was 18.43 per cent. of the working expenditure; for repairs on cars, 8.18 per cent. The total expenditure under all heads was 49 per cent.

INCREASE OF CAPITAL STOCK.—The Empire Mining Co. has increased its capital stock from \$100,000 to \$500,000.

San Francisco:

Saturday Morning, June 6, 1868.

Notices to Correspondents.

METRON.—The principles on which the French and English systems of weights and measures are based, vary very greatly. The more simple method adopted by France, has for its standard of reference the measurement of one of the great circles encompassing the earth. The ten-millionth part of a quadrant of the meridian, constitutes the unit of this system. This quadrantal arc was fixed at 6,213 miles, 1,450 yards, English measure; consequently the ten-millionth part thereof, constituting the meter or standard, is equivalent to 39.37079 English inches, being nearly $3\frac{1}{2}$ inches longer than the English standard yard, and a fraction of an inch longer than the seconds pendulum to be immediately noticed. In England, the standard of length is the yard measure, which is sub-divided into 36 inches. This is based on data obtained experimentally by Captain Kater, that the length of a second pendulum whose oscillations are obtained by the action of gravity alone, at the level of the sea *in vacuo*, at the latitude of Greenwich, is 39.13929 inches. The decimal division of the standard yard has never been adopted by the English generally, but her chemists now very generally adopt the French decimal system of weights, from its great convenience in expediting their calculations. For the ordinary transactions of common life, as respects both coins and weights, much can be said for the convenience arising from their capability of being halved without passing so readily into fractions, when they are divided, in comparison with the decimal mode. The latter mode was adopted at an early period for sub-dividing coins in India.

A RESIDENT OF THE SOUTH.—The area occupied in France in the cultivation of the vine, amounts to about five millions of acres,—a very large part of which is unsuitable for ordinary tillage, consisting of rocky hillsides. The deficiency occasioned in the supply of brandy, owing to the ravages of the "oidium," has, to a considerable extent, been made up from the refuse remaining after manufacturing sugar from the beet-root. The extent of land under cultivation for this root in France, is said to amount to 125,000 acres.

GENEALOGIST.—The name Mordaunt is a corruption of the French word *mordant*, biting, indicating that the party to whom the name was originally applied, was habituated to the brutal habits associated with "rough and tumble" modes of fighting. The Premier Earl of the English and Irish Peerage, is named Talbot, the founder of the family obtaining that name, owing to his possessing the qualities of a bloodhound. So much for aristocratic names.

ONE UNEDUCATED may accept as correct, the statement made to him, that the total pressure on the surface of a man of average size, amounts to between fourteen and fifteen tons, spread over the entire body. To our sensations this is not felt, because, an equally great pressure exists internally as well as externally. The ordinary pump is based upon the same principle, viz., that the pressure of the atmosphere, on the average, amounts to fifteen pounds on every square inch of surface.

POMOLOGIST.—The term Beurré, applied to a very numerous species of pear, signifies the Burrel or Butter Pear, so termed on account of its rich soluble qualities when ripe.

Commencement at Oakland.

The Annual Commencement of the College of California took place at Oakland on Wednesday last. The day was most beautiful, and the attendance of the *litterati* from this city and other portions of the State was large. Vice President, S. H. Willey, presided at the exercises. The following named young gentlemen delivered their graduating orations, which were characterized by unusual ability:

Salutatory, in Latin, by Richard Eugene Poston, Marysville.

Oration, "Empiricism," by Charles Allen Dudley, Mokelumne Hill.

Oration, "Our Mothers," by Richard Eugene Poston, Marysville.

Oration and Valedictory Address, "Truth and its Application," by Charles Augustus Wetmore, Oakland.

The graduating class consisted of five, whose respective standing and honors was as follows, five being the highest mark for class distinction: John Lyman Beard, 4.381, second honor; Clinton Day, 4.269, second honor; Charles Allen Dudley, 4.554, first honor; Richard Eugene Poston, 4.655, first honor; Charles Augustus Wetmore, 4.755, first honor.

The Commencement exercises were of more than average excellence, and gave evidence of unusual promise for the young gentlemen who took a part therein. The Oration by Mr. Benton was worthy of the man and the occasion, and was listened to with marked attention.

The fifth annual meeting of the Associated Alumni of California, was held in the afternoon, and was followed with the usual interesting and unique social entertainment in the evening. These evening exercises are growing more and more in favor. In no part of the world is there such a general and hearty annual gathering of the community of letters as that which accompanies the Annual Commencement exercises at Oakland. The associated Alumni of California, instead of representing a solitary institution, is made up of graduates from all the principal colleges throughout the Union, and many in distant countries. It meets annually upon a common ground of union for friendly greetings, recognizing in its membership only the fellowship of culture and the guild of letters. After the delivery of the Annual Alumni Oration and Poem, and the formality of business, the members proceeded to one of the College halls, where a collation was served up under the auspices of the ladies, who were freely admitted to fill all the vacant space which could be found.

The festivities of the evening were continued until the shrill whistle of the locomotive announced that the hour of eleven had arrived, and that those who would take the last boat for the city, must be up and moving. All the exercises of the day passed off in a most happy and gratifying manner. It was the last Commencement of the "College of California," as the next academic year will commence under the auspices of a full fledged "University."

CONTRIBUTIONS TO OUR CABINET.—We are indebted to Mr. Ezra Carpenter, President, for a fine specimen of cinnabar ore from the "Silver Bone Mine," in Pope's Valley, Napa county. The rock is somewhat peculiar in character, consisting of a kind of indurated clay—a silicate of alumina. It is beautifully studded with bright crystals of cinnabar.

We also acknowledge the reception of some fine specimens from the lava flow, from the recent volcanic outbreak at Mauna Loa. The specimens were forwarded by Mr. Teuant, of Honolulu, through the hands of Mr. Augustus D. Jenny, of the U. S. steamer Lackawana.

CONTINENTAL Life Insurance Company, 302 Montgomery street, corner of Pino.

Foundry Work.

THE GOLDEN STATE IRON WORKS.

We were not a little interested, during a visit the past week, to the Golden State Iron Works, to notice among other things a large number of printing-press castings. On inquiry we learned that the first printing press ever constructed at this foundry, and the first, we presume, on the Pacific Coast, was built last winter for Faulkner & Co., type founders of this city. They are now building three others of the same style and size—a $33\frac{1}{2}$ by $23\frac{1}{2}$ Washington Press, together with an inking machine to accompany each. This is especially interesting as the pioneer enterprise of a new business on this coast, which must eventually become one of much importance.

The same foundry is also building a 10-stamp mill for the Bovee mine, near Angels, Calaveras county. An engine and boiler accompanies this mill. They have just sent off three stamps, with the necessary appurtenances, to be put up at the Mohawk and Montreal Co's mill at Meadow Lake, where the company have five stamps already in operation. An additional boiler accompanies the order. They are also manufacturing one of the new Landrum hall pulverizing drums, such as those in use at the Mariposa Estate.

A heavy set of Cornish Crushing Rolls, with gearing, etc., complete, was shipped from the Golden State Works on Tuesday last, for a mine in Arizona. They also shipped a few days since a Cornish lift pump, with iron hob, for the "Petticoat" mine, at Railroad Flat, Calaveras County. They recently sent up ordinary hoisting machinery for this mine, but that has been found insufficient to keep down the increasing influx of water, hence the present order for a pump. This "iron hob" is quite a novelty in the mode and manner of its construction. Instead of the cumbersome and unwieldy construction usually employed for this apparatus, this establishment has substituted hollow tubing (gas-pipe), thus securing the greatest strength obtainable from the least weight of metal. When we take into consideration the great expense of transportation in this country, the improvement here introduced is an important one. This mine belongs to Mr. G. W. Hopkins, the well known mining superintendent of Virginia City, and is said to be a very valuable and promising piece of property. It is under the immediate management of E. Said, as resident superintendent. We noticed among much other miscellaneous work at this establishment a large number of Roy's improved whale bombs in process of construction. This useful California invention is elsewhere in our columns to-day more fully described.

THE NEW COMMISSIONER.—Mr. Raymond, the new Commissioner for the collection of Mining Statistics on this coast, arrived on Sunday last. The next evening he addressed the California Academy of Sciences. The substance of his remarks will be found in our report of the proceedings of the Academy. The clearness with which he defined his position, and his agreeable style of speaking, made a most favorable impression. He is evidently a "live man." He is moreover by education especially fitted for the office. His acquaintance with the very subjects with which it has to do, made him sought after some two years ago to take the editorship of the *American Journal of Mining*; which position he accepted, and indeed still retains. His affable manner will doubtless disabuse many an honest miner of the notion that "Freiberger" are all conceited and arrogant positivists, who hold in contempt the ideas of "practical men." We predict that he will win golden opinions among us.

ACRES.—A statistician has figured out the arable land in the United States. It amounts to 52,000,000 farms of 160 acres each, or 8,320,000,000 acres.

Mechanics' Institute.

The regular monthly meeting of the Mechanics' Institute was held on Thursday evening, at their hall, on Post street. The report of the President for the quarter ending May 31st, was read. We append the bulk of the report:

The finances of the Association are in a very slightly improved condition.

We owed on the 1st of March, 1868.....\$3,839 54

We owe this date.....2,124 36

In addition to the above, is the debt of \$50,000 secured by mortgages on the building.

The receipts for the past month have been \$3,321.50. Disbursements during the same time \$4,208.28.

MEMBERSHIP AND LIBRARY.

The present membership is 1,156. New works added to library during past quarter, 344. Efforts are being made to increase the number of periodicals for the reading room.

PROPOSED POLYTECHNIC INSTITUTE.

It is desirable that we should bring ourselves in more intimate connection with the mechanical, scientific, inventive and industrial genius of the State, and exert ourselves to place before communities here and abroad the progress made in these various departments, and which is attested by the vigorous building of railroads, development of ocean navigation, and the large number of patented inventions. In this connection I propose to call a meeting of those interested in this particular, for the purpose of organizing a society similar to the Polytechnic Society of the American Institute, believing that by a proper identification with all which relates to the Arts and Sciences, our membership will be largely increased.

THE STATE FAIR.

The time of your officers has been largely absorbed in projecting and furthering the Industrial Fair, to be held this fall, and they have labored under some difficulties from unexpected sources. Before the adjournment of the Legislature, and previous to your last annual election, it was well understood that you were somewhat justified in feeling that you had the assurance of an appropriation of \$10,000 from the State, to be devoted to premiums at the forthcoming Fair. It was reasonably expected that with this as an incentive to inventors and exhibitors, the result of the Fair would go far toward wiping out the heavy debt under which we are now struggling, and which is taking our life's blood. It was with regret and surprise the Directors learned that one of the committee having in charge the matter of the application to the Legislature for an appropriation, and who reported so favorably to your meeting in February last as to obtain the thanks of that meeting, had so far forgotten his relations to this Society, and the members thereof, as to use his official position to prevent this Society obtaining the appropriation, which "there was every reason to believe" had been unanimously agreed to by the Committee of Ways and Means of the Assembly.

The Directors have obtained loans guaranteed by the net receipts of the forthcoming Fairs to the amount of \$20,000, and find everywhere a feeling of hearty good will and tender of pecuniary assistance. Work has been commenced on the Fair building on Union Square, and is being pushed ahead under the immediate personal superintendence of Mr. John Dickson, and in charge of the Building Committee, the same being done by days' work. It is expected that the building will be ready to receive goods by the first day of August, the eighth of that month having been appointed for the opening. There is a general desire to exhibit by the public, and a large percentage of the space has been already engaged. This is encouraging, when we consider that the building will cover an area of 68,000 feet. We have to acknowledge courtesies on the part of the State Agricultural Society, and efforts in our behalf, especially before the Legislature, in the matter of the appropriation, and it is to be hoped that the kindly feeling so happily inaugurated last year may continue to our mutual benefit and to the advantage of the State at large.

We are under deep obligations to our Members of Congress for favors extended, also to the many friends of the Society, who have given us substantial tokens of their good will by constantly forwarding to us various newspapers, magazines and other documents. A. S. HALLIDIE, Pres.

DEEP AND DEEPER.—The artesian well is on the Colt estate at Hartford, has reached a depth of 1,300 feet, and is to be bored 200 feet deeper.

California Academy of Sciences.

REGULAR MEETING.

MONDAY EVENING, June 1, 1868.

Vice President Dr. James Blake in the Chair.

The committee appointed to make arrangements for a course of lectures, reported the following arrangements for the delivery of lectures: Lecture to be delivered by Dr. James Blake, on the third Monday in June; by Dr. Henry Gibbons, on the first Monday in July; by Dr. Cooper, on the third Monday in July; by Mr. Falkenau, on the first Monday in August; by Dr. H. N. Bolander, on the third Monday in August; by H. G. Bloomer, on the first Monday in September; by Theodore Bradley, on the third Monday in September.

Milton S. Latham, Frederick Townsend, and Dr. B. D. Deau were elected members of the Academy.

A resolution formally reported from the Council, for reduction of life membership fee to \$100, was adopted as an amendment to the Constitution.

On the recommendation of the Council, a Committee, consisting of Dr. Cole, Dr. Cooper, and Mr. Bradley, was appointed to inquire if rooms for the Academy's use can be had from the city.

H. G. Bloomer was elected Director of the Museum.

Several donations were made to the cabinet, when business was suspended in order to listen to R. W. Raymond, newly appointed Mining Commissioner, who was present.

The President then introduced Mr. Rosaiter W. Raymond, the new Commissioner of Mining Statistics, who arrived on Sunday in the steamer, and was invited to address the Academy. Mr. Raymond returned thanks for the kindness of his reception, and proceeded to give an interesting statement of his plans and views in connection with the discharge of his duty as Commissioner. Alluding to the limited time allowed him for his first report, and to the fact that the political struggles of the day had prevented Congress from making the usual appropriation for the purpose, he explained that his object for the present summer was to observe, study, and listen, and, by personal observation, to acquaint himself with the condition, prospects, and requirements of the mining interest. He could not attempt to do justice to particular districts, or to travel everywhere. He should be governed entirely for the present by his own judgment as to what he ought to visit, for the purpose of informing himself, and so preparing himself for greater usefulness and effective action when the necessary means should be put in his hands. If he found next October that he had any valuable ideas, he should communicate them to the Government. If not, he hoped to have sufficient moral courage to confess the fact, and to abstain from a report. Mr. Raymond paid a high compliment to the industry, sincerity, and ability of his predecessor, Hon. J. Ross Brown, and showed that it was now necessary for the work to take a new shape and direction. The duty concerned first the Legislature, second the citizens of the country, and finally science. It was his business, primarily, to furnish such information and advice to the Government as would form a sound basis for legislative action. If incidentally this information should be valuable to the public, so much the better; and if the interest of science could also be subserved, then the highest aim would be accomplished. But the first duty was to the Government, and concerned therefore the relations between the Government and the mining industry.

Mr. Raymond then presented his views upon the general subject of governmental interference with mining. He claimed that as the product of mining, though of permanent value, is from a limited and exhaustible source, while agriculture furnishes a supply of perishable wealth from a perennial source, and furthermore, since the mistakes and losses of mining are to a certain extent irrevocable and irreparable, while those of agriculture are repaired by time and skill, Government has a certain relation to mining, as a trustee of the resources of the country, which it does not claim toward agriculture. He was opposed, however, to all burdens and restrictions on the miner. He thought the Government should meddle with no industry; but there were two points in which the Government was bound to legislate, the first for the sake of the miner and the second for the sake of the country. The first was the question of title, which should be settled on some equitable, free, and uniform basis. The second was a necessary safeguard against wanton or ignorant waste and destruction of our mineral resources. For this purpose

he believed a National School of Mines would be the best and the only means. He thought mining education was worth five hundred mining laws. The subject of a National School of Mines was too great a subject to be discussed this evening, but he believed in a really National school—not local, not State, but National. He did not think that a Bureau would do the work. It must be a school of Mines, and a school in which mining was to be the specialty—not mineralogy, not general science, but the business of mining. He knew that they were going to have a University, and he hoped it would be a good one, but he believed that it never should supersede the necessity for a National School of Mines. He proceeded to speak of the feeling of the mining community with regard to scientific men. There were too many who imagined that every man who came from Germany, or called himself doctor, was a perfect oracle. Again, there was a class to the full as incredulous, who never would believe that any man with a handle to his name could be anything better than a humbug. Here in California, however, above all other places known, men took their places for what they were worth; and he never would believe that while science is knowledge, and knowledge is power, science would be "played out" here. Mr. Raymond closed with the expression of his belief that the extension of knowledge among the people is the true and only security for our democratic institutions and our national glory.

Mr. Falkenau, on behalf of the Academy, expressed a cordial sympathy with the ideas advanced by Mr. Raymond, and moved that the suggestion as to mining education be made the subject of a special debate. On motion of Dr. Cooper, the third Monday in August was fixed for the opening of such debate by an address from Mr. Falkenau. The Academy then adjourned.

HARDNESS OF COKE CRYSTALS.—It is not generally known that the substance known as coke is exceedingly hard, in its minute form of crystallization. Coke is generally considered as a very soft substance. Such an impression has obtained, however, from the ease with which it may be crushed and pulverized; but it has been found that the minute crystals of which this substance is formed, are intensely hard, and are even possessed of the remarkable property of cutting glass. The term "cutting" is used here with a full understanding of its meaning, and in contradistinction from the process of "scratching," which many other substances than the diamond or coke can accomplish. The cut produced by a crystal of coke, properly manipulated, is so clear, clean and perfect, as, like the diamond cut, to exhibit the most beautiful prismatic colors, owing to the perfection of the incision. This quality of the extreme diamond-like hardness of coke, it would seem, ought to prove of value in many processes in the arts, so as to be a useful discovery as well as one of a highly scientific interest. If coke really possesses such extreme hardness, why may it not be employed as a substitute for emery?

A NEW WHALE BOMB.—While at the Golden State Foundry, a few days since, our attention was particularly attracted to a new and evidently most effective whale bomb, the invention of Captain Roys, of this city, and an improvement on the bomb generally in use, which is also his invention. The bomb, as is well understood, explodes within the body of the whale, and it is said that fully three-fourths of all the whales so killed, sink and are lost, for the reason that the harpoon which is attached to the bomb has but little holding power. This bomb is so constructed that immediately on its explosion a large cross-arm is thrown out in the cavity thereby produced, which effectually prevents the withdrawal of the harpoon, and renders the loss of the whale impossible, if the boat and tackling is sufficient to hold on. The invention, we should judge, was one of much importance to the whaling interest everywhere.

CANTON FLANNEL, previous to washing, is said to be the best article for polishing the eyes of spectacles. This recommendation is given on the authority of C. Muller, the well-known optician, 205 Montgomery street, in this city.

FLOUR MILL REMOVAL.—Workmen are busily engaged upon the new building for the Golden Gate Flour Mill, now being erected on the lot adjoining the Union Foundry, on First street. The present premises on Pine street will soon be vacated, and some ornamental structure will no doubt be erected in place of the unsightly pile of brick and rough wood work, which has so long marked the locality from which some of the finest flour on this coast has been derived.

BUERK'S

Watchman's Time Detector.

THIS WATCH-CLOCK WAS INTRODUCED TO THE public in almost every section of the United States and Canada about five years ago, and it has proved itself to be the best invention in the world for testing the faithfulness of Watchmen. Since its introduction, the Proprietor has improved on some parts, and corrected deficiencies and he has now

A Perfect Check upon the Watchman.
With other Clocks, a regular routine has to be followed, but with this Watchman can be ordered to visit any particular place as often as required, without being compelled to go to places where it is not necessary to visit as often. The instrument is complete in itself, portable, and as reliable as the best lever watch.

It is not so likely to become disarranged in its works as a good watch, because its parts are stronger. But when it needs cleaning, any common watchmaker can adjust it, its mechanism being simple. It requires no fixtures or wires communicating from room to room, as is the case with the ordinary Watch Clocks; a small, inexpensive stationary key is alone required at each station. By its use places can be guarded that it would be impossible to guard with any other instrument, such as Railroad Tunnels, Bridges, Yards, Ships, etc. The instrument will in all cases be warranted perfect and satisfactory. Its price is invariably Seventy-five Dollars, cash on delivery, including as many keys as are requisite, not exceeding twelve.

THIS WATCH-CLOCK IS SOLD AT A LESS PRICE THAN ANY OTHER IN THE MARKET.

The DETECTOR is extensively used by large Manufacturing Establishments and Railroad Companies in the United States, from whom numerous testimonials have been received.

This Detector is covered by two U. S. patents. Parties using or selling these instruments without authority from me will be dealt with according to law.

N. B.—Parties purchasing these Clocks should test them sufficiently in the counting-room or office, as they will not be taken back after having been injured by the Watchman through carelessness.

All communications promptly attended to. Address
J. E. BUERK, Proprietor,
47 Congress street, Boston.

Support Home Manufacturers.

California Pioneer Fuse

MANUFACTURING COMPANY,

MANUFACTURERS OF

HOSE AND TAPE FUSE,

A New and Superior Article for Blasting in very wet ground, or under water.

Great difficulty has heretofore been experienced by miners, and others in the use of Fuse, which has been subjected to deterioration from exposure to dampness during transportation, or during the great length of time which has passed between its manufacture and use. In addition to great painstaking in the manufacture of the California-made Fuse, the above and many similar objections are entirely obviated, and the operator can always depend with certainty upon the burning of his fuse.

It is often the case that extra lengths are required, as exploding tunnels, etc., longer than is furnished in the imported article. Fuse of every desired length or size can be made to special order, at the above manufactory.

Manufactured by J. S. POWNING, Sec'y. JAS. EVA, Supt.

Pacific Iron Works.

First and Fremont Streets,
SAN FRANCISCO.Having been established since 1851, we have accumulated
a very large variety of Gear and other Patterns, which,
with our superior tools and appliances, give us facilities for
doing first class work unequaled on the Pacific Coast.

Among other things, we manufacture the following:

STEAM ENGINES,

Horizontal and Vertical, for either Stationary or Marine
use.

BOILERS—High and Low Pressure,

Pump, Pipe and Sheet Iron Work of every kind.

Quartz Mill Work,

Including High and Low Mortars, for wet or dry crushing;
Furnace Irons for Roasting Ores; Freiberg Barrels;
Ruff & Bench Co. Hartford, Ct. As a simple, effective, FULL
SAVING, first-class Engine, this is, without doubt, the best
Engine made in the United States.Flour Mill, Saw Mill and Sugar Mill Work in every variety;
Pumping and Hoisting Machinery; Hand-brow's
Patent Challenge Pump, for Domestic,
Ship and Mining use—the most
approved and successful
Pump manufactured.

Castings of every description, Iron and Brass.

We would call especial attention to "Wright's Patent Vari-
able Cut-off Engines," of which we are the sole manu-
facturers on the Pacific Coast, under license from the Wood-
ruff & Bench Co., Hartford, Ct. As a simple, effective, FULL
SAVING, first-class Engine, this is, without doubt, the best
Engine made in the United States.Orders promptly attended to. Prices as low as possible
for first-class work, and we intend to do no other.

ROOM YET FOR IMPROVEMENT.—The im-
proved rails form the first hopeful approach
to something like perfect railways, inas-
much as from their great stiffness they can
be made to more nearly conform to, and be
maintained in, mathematical lines and
planes, than can the crooked, yielding bars
so long employed. With the latter, there is
only a rough approximation to parallelism
of way, to straightness of line, and to a
plane surface. A thousand successive
gaugings over as many feet of way, gauging
foot by foot, would show constantly recur-
ring points of tight and loose gauge; and
we actually allow, indeed we are compelled
to allow, nearly or quite $\frac{3}{4}$ inch "play"
between the flanges of the wheels and the
rail, in its supposed position of 4 ft. 8 $\frac{1}{2}$
inches from its opposite neighbor—it really
being anywhere from 4 ft. 8 $\frac{1}{2}$ inches to
4 ft. 9 inches off. In its power of support
in a vertical direction the rail receives the
blow of a driving wheel, loaded to say 5
tons, and in some cases to 7 $\frac{1}{2}$ tons, and
sinks under the wheel, and, in thus sinking,
a wave is raised both in front of and behind
the point of application of the pressure,
the rail being lifted in each direction into
the air, taking its substructure of chairs
and sleepers with it. Every plate-layer,
standing near passing trains, knows what
this is, and how the rails are hammered
into and notched upon the chairs, and how
the chairs are bedded into and driven half
way through the sleepers, and how the
sleepers are banged up and down in the
ballast, to the great consolidation of the
supporting substratum, the production of
dust, and the increase of the resistance to
traction; although upon the latter point the
plate-layer's views may not be so definite as
upon the others we have mentioned. Let
a pile be driven close to the rail, and upon
this pile place the fulcrum of a light lever
whose arms are in the ratio of 10 to 1, or
even 20 to 1. Let the shorter end be in
contact with the under side of the rail, mid-
way between two sleepers, and the other
will show, on the passage of the train, what
the rail is doing and how uneasy it is.

Nothing in the principles of mechanics
is more certain than that (as first ably main-
tained by George Stephenson) the resist-
ances to traction upon a perfect railway
would be constant at all speeds; and we
know that these resistances may amount to
so little as 6 lbs. per ton moved on a level,
this being about the minimum at slow
speed. So far, however, from this being
the measure of the resistance at 60 miles
an hour, the draught then amounts to nearly
30 lbs., if not, indeed, to more than that!
Yet we tolerate imperfect railways and sub-
mit to this enormous waste of power, with
all its attendant wear and tear, danger and
impoverishment of railway capital. We
ought to ride safely at 100 miles an hour,
and attain that speed with engines of half
the present weight. We say we ought, be-
cause if wheel and rail fitted each other, in
the manner of first-class machinery for al-
most any other purpose, three-fourths of
the present resistance at high speed would
be avoided.—Engineering.

FRENCH PATENT LEATHER.—The process
which has been so successfully adopted by
the French artisans in glazing leather, so as
to give it the repute for superior quality and
beauty which it now universally sustains,
is to work into the skin with appropriate
tools three or four successive coatings of
drying varnish, made by boiling linseed
oil with white lead and litharge, in the pro-
portion of one pound of each of the latter
to a gallon of the former, and adding a
portion of chalk or ochre—each coating
being thoroughly dried before the applica-
tion of the next. Ivory black is then sub-
stituted for the chalk or ochre, the varnish
thinned with spirits of turpentine, and five
additional applications made in the same
manner as before, except that it is put on
thin and not worked in. The leather is
rubbed down with pumice-stone powder,
and then placed in a room at 90°, put out
of the way of dust. The last varnish is
prepared by boiling one-half pound of as-
phalt with ten pounds of the drying oil
used in the first step of the process, and
then stirring in five pounds of copal var-
nish and ten pounds of turpentine. It
must have a month's age before it is fit for
use, in order to exhibit its true character-
istics.

SCIENTIFIC CANE.—An English medical
gentleman has invented an electric cane,
with the view of self-defence against noc-
turnal attack. In the handle of the cane
is placed an electric pile, with carbon points
and reflector. On touching a spring the
apparatus works, emitting a concentrated
ray of electric light, which can be thrown
full in the robber's eyes, and thus dazzling
him, safety may be found in running away.

DEATH OF A TREE SIX THOUSAND YEARS OLD.—The great Dragon Tree of Orotava, Tenerife, the King and Nestor of the Monocotyledons, is no more. A drawing of it made by Mr. Borda, 100 years ago, was published about sixty years ago by Humboldt, who first drew scientific attention to this vegetable wonder. The late Mr. Webb published, in his history of the Canaries, figures of it taken after the storm of July 21st, 1819, had destroyed half its crown; and it has recently been described, measured and photographed by Prof. Piazzzi Smyth. He gave the trunk a girth of 48½ feet, at the lowest accessible part, and a height of sixty feet. Fenzl of Florence, who announces the demise of the tree, makes the circumference about seventy-eight English feet, but intimates that he was not able to measure it exactly. When he visited it, a year ago, "it was still in excellent health, its immense crown covered with innumerable panicles of scarlet fruits, and the huge trunk, although completely decayed in the interior, sustained vigorously the spreading mass of fleshy branches and sword-like foliage." He charges the destruction of this famous historical monument to the sheer carelessness of the Spanish authorities, who might have prevented it by keeping up sufficient props. That venerable trunk was, it is said, as hollow and about as large in the year 1402 as in recent times; and the hollow had even then been used immemorially by the Guanches for religious rites. The age of 6,000 years which has been assigned to it by some of the "most sober naturalists" may not be very greatly exaggerated. Probably even the cavity was as ancient as the oldest of California Redwoods.—*Silliman's Journal for March.*

REFINING SUGAR.—The improved process, patented in Germany by Messrs. Pierre & Massey, consists in bringing saccharine juice, after being clarified in the usual way by means of lime and carbonic acid, to a boiling temperature, and precipitating it with caustic baryta; the precipitate is then suspended in water, and decomposed with carbonic acid. About 60 parts of baryta is required for every 100 parts of sugar. The sugar solution, thus purified, is afterwards evaporated.

Cocoanut Matting, Rugs, Mats, Etc.

And Cocoanut Fiber for Upholstery.

South side Chestnut street, bet. Polk and Larkin streets, SAN FRANCISCO.

BY A PROCESS ENTIRELY NEW, THE PROPRIETOR is now manufacturing in quantity sufficient to supply the demands of the trade, A NEW AND SUPERIOR MATERIAL FROM THE FIBER OF THE COCOANUT—the best substitute for curled hair hitherto discovered—for mattresses, chairs, lounges, and all upholstering purposes. The following are some of the advantages which it possesses over all other materials used for the above named purpose:

1st. It is cheaper, all things considered, than most articles in use.
2d. It is the best and purest material known in the market, being entirely free from all offensive smell.
3d. It is the most durable, not being subject to rot after years of exposure to moisture and dampness.
4th. It is remarkable for its elasticity, rivaling, in this respect, the finest curled hair.
5th. It contains nothing to breed vermin or support insect life, being entirely freed in process of preparation from all deleterious vegetable matter.
Lastly. It does not pack; is free from dust; much lighter, and in general obviates all the objections to piled, prepared shavings, soap root, and other inferior substitutes for feathers and hair. 22v16m

THE GOLDEN ERA.

Founded in 1852, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent.

THE GOLDEN ERA

Is the most universally popular of all the Weekly Journals. It presents forty-eight columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected matter. It is a welcome guest in Cottage and Cabin: the favorite at the fireside in city and country; the most useful, agreeable and altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe and elsewhere. Every household in the mountains and valleys, the cities, towns and mining camps of California, and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor. Inspired with the genius of the age, it is progressive, and aims not so much at distinction as a newspaper, as at honorable success in its capacity of a great Moralizing and Improving Influence. Exercising a positive power for good, and wielding a permanent influence, many able and eminent writers choose its columns as a means of communicating with the public. No effort will be spared to make it a thoroughly California newspaper, and worthy of the support of all classes of our citizens.

SAN FRANCISCO

HYGEIAN HOME WATER CURE.

No. 637 California street, opposite St. Mary's Cathedral.

WE HAVE NOW THE MOST EXTENSIVE AND COMPLETE Health Institute on the Pacific Coast, both for ladies and gentlemen. The success which has attended industry and an honest persistence of this rational mode of curing the sick for the past ten years, has enabled Dr. Smith to establish a home combining all the Hygienic appliances essential to the invalid. Owing to our increased facilities, we feel warranted in reducing the price for gentlemen to \$20 per month; to ladies from \$15 to \$20 per week for board and treatment.

BARLOW J. SMITH, M. D., Physician and Surgeon. 21v16-3m H. G. COSGROVE, Superintendent.

ARREST OF DRIFTING SNOW AND SAND.
In Southern France the railways are seriously embarrassed every winter by snow drifts filling the deep cuttings, but the past season a section of the line of railway from Saint Etienne to Annonay, has been kept open by the judicious planting along the banks, on either side of the track, of pine trees; a system of treatment previously adopted in arresting the dunes, or inroads of sea sands, which in many parts of France used to annually cause great damage.

ENLARGEMENT
OF THE
American Journal of Mining
Volume III, Commencing March 3.

In consequence of the remarkable success that has attended this Journal, the proprietors feel warranted in increasing its size to

Twenty Pages,
Thus making it the LARGEST and most COMPREHENSIVE Mining Journal on this continent, representing the Gold, Silver, Copper, Iron, Lead, Coal, Salt, Oil, and in fact all the Mineral interests of America, containing beautiful engravings, illustrating the latest improvements in mining, mining and metallurgical machinery.
The Journal has won the encomiums of the press of the entire country and Europe, and numbers among its contributors more eminent scientific men than any other weekly publication in America.

The reports of the markets in stocks, metals, minerals and ores, carefully corrected weekly, are an important feature of the Journal.
Subscriptions: \$4 per year; for six months, \$2.25—in advance; single copies, 10 cents. Specimen copies sent free.
Address, **WESTERN & COMPANY,**
Publishers, 37 Park Row, N. Y.

Pamphlet containing the Law and the Instructions of the General Land Commissioner, post paid, 25 cts. Address **DEWEY & CO.,** Mining and Scientific Press, San Francisco.

Important to Californians.—Many inventors have lately had their claims for Patents seriously (and in some cases fatally) delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. The Mining and Scientific Press Patent Agency has strictly complied with the requisitions of the Department, and properly filed all necessary papers as Claim Agents.

AN INSTRUCTIVE BOOK!

Prof. LAYNES'

ELEMENTS OF COMPOSITION,

BELLES-LETTRES AND ORATORY

For Scholars, Teachers, Lawyers All Professional Persons, and those of Common Education, who would improve the Eloquence and Effectiveness of their Composition and Manners of Address.

Price, postage paid, - - - \$1.10

This is a new publication, and in style and treatment of this important subject, is original, simple, plain and comprehensive. The author, Prof. LAYNES (a meritorious Teacher of good standing in California, and a sound thinker and reasoner,) in his preface says: "The method pursued by the Author in developing the subject of Composition, is both the synthetical and analytical. The former is necessary to teach the theory, the latter the practice of the art; and as these are both indispensable to the scholar, so are also the two methods, as the sequel will show."

The Work has lately been approved and authorized by the State Board of Education for use in the Public Schools. To further illustrate the varied and popular endorsement the book has so rapidly received, we quote the following

RECOMMENDATIONS:

It is simple, concise, and well arranged. It seems to be a work of great value.—John Seelt.

I am prepared to concur in the recommendation of the Honorable Superintendent of Public Instruction.—J. C. Pelton.

After an careful and thorough perusal of the same as it was in my power to give, I came to the conclusion that, for conciseness, correctness, and precision of definition, as well as for completeness and simplicity of style, it was, and would be, without a rival. I regard your work as the best at its kind. I know of but few men in any profession who would not be benefited by its careful study.—Wm. H. Hall.

I regard it as one of the best treatises upon these important branches—perhaps the only one in the English language, equal advantages—combining comprehensiveness with conciseness, and of such simplicity in its arrangement as to be readily understood by the advanced pupil.—F. W. Hatch.

It is admirably arranged to develop the correct idea of the analysis and synthesis of language, and the amplification of ideas into sentences and periods. The style is clear, terse and pleasing. I do not hesitate to recommend it as a great acquisition to our text books.—James Denman.

I am happy to express my conviction of the value of the whole treatise. It would give me much gratification to see so thorough and excellent a treatise emanate from young California.—Martin Kellogg.

I recommend it to all those who wish to obtain a book that will give them the education of young men in America, and to express their thoughts and feelings in a clear, simple, and forcible manner.—Caroline L. Atwood.

I regard the book about to be published as far superior to any work extant upon that subject.—Wm. S. Hunt, A. M.

I believe the work will be a valuable and much needed addition to our school text-books.—Hernon Perry.

You have brought the results of a profound analysis, and made them available, in a practical form.—J. H. Brayton.

I can recommend it particularly to my young friends of the legal profession, as a source from which they may be able to learn much of value as special pleaders and advocates at the bar.—John Curry.

The subjects upon which you treat have heretofore been too much neglected in the education of young men in America. * * * Exactly calculated to interest. * * * It will soon become a necessity in every lawyer's library.—Charles A. Tuttle.

Its clearness and comprehensiveness make it easy.—G. W. Boice.

A gentleman of varied learning and ripe culture, who has half a dozen languages at his tongue's end. He seeks to teach the student not only how to make sentences, but how to construct them. His system has the merit of originality. We know of no work in which can be obtained so lucid an exposition of the elements of composition, and such valuable assistance in learning how to put his ideas into language. Prof. Laynes has done the cause of popular education good service.—S. F. Bulletin.

This is a San Francisco book by a San Francisco author. It contains 166 pages, and is altogether creditable to San Francisco. It meets a public want, and meets it in a form and size cheap and convenient, and in reach of the humblest.—Alta California.

The writer, the lawyer, the minister, or the statesman, may study its rules and definitions with profit. Nothing conduces more to the purity of a national literary taste than a general and thorough knowledge of the rules by which the construction of language is governed.—S. F. Times

Prof. Laynes plunges at once "in medias res." He seizes a sentence (which is the unit in composition, whether written or spoken) holds it up before you; tears it to pieces before your eyes—or rather, we should say, neatly and skillfully dissects it—displays one by one its several parts; makes you thoroughly acquainted with each, in its entirety; and then shows you how to put them together again. A series of such experiments, increasing in complexity as gradually that you do not feel the difficulty, and the thing is done; you are master of the subject.—Mining and Scientific Press.

Its design is to show that ideas can be so arranged as to increase their force, to teach the student to make sentences, to construct them, to put them together again. A desideratum long felt is supplied.—S. F. Examiner.

This is an age in which the occasions are rapidly multiplying, when educated men, and women, too, are called upon to express their views in writing, either for public or private inspection and criticism.—Sedition Independent.

The most eminent educators in California give it their hearty approval, and we concur.—Maryville Appeal.

Not only one of the best of its kind, but, what is still better, one of the briefest. It contains 166 pages.—Virginia Enterprise.

Price, \$1.10. Sent by mail, postage paid, without extra charge. Liberal reductions made to the Trade, Teachers and Schools, ordering by wholesale. Orders received by our Traveling Agents.

Address DEWEY & CO., Mining and Scientific Press, San Francisco.

CHANCE OF BASE.—As a good evidence of the growth of San Francisco, many of our large manufacturing establishments, one after another, are found seeking more room at cheaper rates, farther south or nearer the water front. We have just taken a look through the spacious new buildings, recently erected at Nos. 114 and 116 Spear street, by Mr. E. O. Hunt—formerly on Second street—and widely and favorably known throughout this coast as an inventor and builder of different kinds of machinery. These buildings have been put up specially for his business as a manufacturer of wind-mills, horse-powers, pumps, etc., covering a full water lot 136x45 feet, two stories in height, giving him ample room and greatly increased facilities. See advertisements in to-day's issue and on monthly covers.

Still other Removals.—We may mention in the above connection, that the iron door manufactory of Calvin Nutting, has lately been removed from Bush street to Market, near First; the Vulcan Forge and Machine Shop, L. P. Garcin, proprietor, from Sutter to Howard, near Beale; the Columbia Foundry, L. Reese, from Fremont to Beale, near Howard street; the Empire Foundry, Flynn & Youse, from Mission street to 204 Howard, near Beale, and the Phoenix Iron Works, from Battery to Fremont street, near Treadwell & Co's warehouse. All these removals, it will be observed, are towards the water front, from old locations more or less isolated and removed from the chief center of our heaviest manufacturing establishments.

THE OBJECTIONS TO NITRO-GLYCERINE. L. H. Mitchell, Mining Engineer, in an article written for the *American Journal of Mining*, gives the results of careful experiments made during 1865 and 1866, in four of the principal mines at Freiberg, Saxony. The advantages of this compound as a blasting agent, have already been fully and repeatedly noticed in the Press. We here give some of the objections to it as condensed from the language of Mr. Mitchell: "The fact that occasionally a part of the nitro-glycerine does not explode in blasting, renders it dangerous. The part which does not explode, is generally thrown about upon the surfaces of the rocks in the form of a thin coating, where it may by a chance blow be exploded unexpectedly. Again,—it is found to be positively injurious to the workmen; especially so are the gases arising from its combustion. In many cases, its evil effects have shown themselves in such a manner that the miners were at once obliged to abandon its use. Another objection is the want, at present, of an easy and simple method of testing the article, in order to judge of its fitness for use."

IRON AND STEEL IN FRANCE.—The French iron and steel manufacture, has since the employment of a mixture of foreign iron minerals with their own ores, assumed a new importance. With this aid, the French coke-made pig iron, which before was useless for the manufacture of puddled steel or cast steel, rendering it necessary to import from abroad costly charcoal-made pig for that purpose, can now be used for the manufacture of Bessemer steel of good quality.

New Mining Advertisements.

Fogus Mill and Mining Company.—Location of

Works: Amador County, Cal. Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the third day of June, 1868, an assessment of five dollars (\$5) per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, No. 318 Front street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the eleventh day of July, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the twenty-eighth day of July, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOHN J. SCOTCHLER, Secretary.

Office, No. 318 Front street, San Francisco, Cal. my6

Silver Sprout Mining Company.—Location of

Works and Mines: Kearsarge District, Lyon County, Cal. Notice.—The Annual Meeting of Stockholders of the Silver Sprout Mining Company, for the purpose of electing Trustees to serve for the ensuing year, will be held at the office of the Company, No. 418 California street, on TUESDAY, JUNE THIRTIETH, 1868, at 3½ o'clock, P. M.

T. B. WINDARD, Secretary.

San Francisco, June 5, 1868. my6-4w

Office Neaton Mining Company.—Location of

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merit.

This Amalgamator Operates as Follows: The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the
PACIFIC FOUNDRY,

San Francisco.

SUPERIOR CUT-OFF ENGINES.

We desire to call the attention of Engineers, Manufacturers, and Millmen, to the celebrated

Hartford Engine,

With Wright's Patent Variable Cut-off, which we are now manufacturing under a license from the Woodruff & Beach Iron Work Co., Hartford, Ct. To parties wishing a First-class

Fuel-Saving Engine,

Simple and durable in construction, this Engine is offered in the belief that it is superior to any other manufactured. It enjoys the very highest reputation in the Atlantic States, where it is well known; over 300 of them having been built by the Woodruff & Beach Company, and being now in successful operation.

HOWE & STICKNEY,

MANUFACTURERS OF

Models for Patent Machinery.

All kinds of

Silver-Plating, Locksmithing, Bell-Hanging,
etc., executed in the best manner.

12v15t No. 625 Mission street, near Second.

T. STEBINS,

Pattern and Model Maker,

Has recently opened a shop at No. 23 Fremont street, over Clark & Co's Foundry, where he is prepared to execute with neatness and dispatch, all kinds of models in wood, brass or iron, and patterns of every description. Jig-Saws of any size or strength, of a new and superior quality, built to order. Also, an ingenious machine for Polishing Shirts, well adapted for Laundries.

Terms reasonable for all classes of work, and regulated by the style required. 11v16-3m

OIL STOVES!

MORRILL'S

Petroleum and Universal Oil Stoves

Have proved themselves a superior substitute for Wood and Coal Stoves, in that they work quicker, are neater, bake and broil better, are MORE ECONOMICAL generally. They are portable, can be used in any room, with or without chimney, as they emit no smoke, soot or ashes. There are nine different sizes, designed for barbers, dentists, and other mechanical purposes—as well as for cooking. They are perfectly safe.

I now offer a reward of \$100 for every Petroleum Stove exploded by Naphtha, sold or used at my store, 13 Geary street, where they are for sale by

M. B. BULLARD,

Proprietor of Petroleum Stove for California, and Agent for Universal Oil Stove for Pacific Coast.

N. B.—Petroleum Stoves burn Naphtha converted into a gas. Universal Oil Stoves burn Naphtha, Benzine, or Coal Oil, with non-illuminating flame and light on a wick as easy as a lamp. 2v16-3m

Gold and Silver Ores.

BRODIE'S PATENT IMPROVED QUARTZ CRUSHER.

The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:

No. 1.—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price.....\$600
No. 2.—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour..... 850

No. 3.—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour..... 1,200
These Crushers have been erected at several mines in the State of Nevada, and others in Calaveras, Tuolumne and Mariposa counties, to whom applicants can be referred as being the most efficient, cheapest, and least weight compatible with strength and durability, of any Crusher yet erected.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866.

With a Chapter on the

BLOW-PIPE ASSAY OF MINERALS.

By WM. BARSTOW, M. D.

Published by A. Roman & Co., San Francisco.

For sale at this Office.—Price, One Dollar.

With the aid of this Book, the miner can assay his own ores, requiring but few materials, etc., except such as are generally to be found in the interior towns. 2v15t

California Labor and Employment Exchange

319 Battery Street, San Francisco.

MINING COMPANIES, MANUFACTURERS, CONTRACTORS, and employers of all descriptions of labor, are requested to send their orders to the Exchange at o. c. 19v16-3m H. C. BENNETT, Secretary.

Lead Pencils.

Every one knows, probably, what a black-lead pencil is, but it is not generally known that there is not a particle of lead in the pencil. The material variously known as black-lead, graphite or plumbago, is almost wholly composed of carbon. It probably owes its misnomer to the fact that previous to the employment of graphite for making pencils, common lead was used, and this within the present century. For a long time the best graphite was obtained, not in very large quantities, at Borrowdale, in the English county of Cumberland, where it was discovered in 1564, early in the reign of Queen Elizabeth, and pencils, much like those still in general use, were produced in the year following. As the supply of the graphite (known in Cumberland, while in the mine, by the title of wad) was not large, the British government, from the first, took great pains to prevent the exportation of the article, and even to limit its home sale to a supply just sufficient to meet the estimated demand. Graphite is found in various parts of Europe, and even in North America, but of very inferior quality. The Cumberland mines were worked only a few weeks in each year, yet the yield of wad was estimated at £40,000 a year. While the graphite lasted, England had a monopoly in supplying the best pencils to the world. Year after year, for a century past the graphite deposit in Cumberland became "fine by degrees and gradually less." The result was that graphite powder had to be compressed into a solid cake from which pencils could be supplied. A French variation, said to be an improvement, was to mix the powdered and purified graphite with clay, which is largely done still.

Nearly one hundred and fifty years ago, the pencil manufacture commenced in England, and improved in France; was transplanted to the village of Stein, near Nurnberg, in Bavaria, and, little more than a century since, Casper Faber there began to make the pencils which continue to be made by his descendants, and bear the family name, all through the world. The present John Lothair Faber, great grandson of Caspar, has been head of the firm since 1839, and is not only very wealthy, but was lately ennobled by the King of Bavaria. One of his brothers is associated with him at Stein, in the processes of manufacture; the youngest of the three, Eberhard Faber, represents the firm, for the Western World, at New York. Stein is literally a town of pencil factories, of which Baron Faber is the ruler, taking care of the health, government, education, industry, thrift, and amusements of the inhabitants, and always living in their midst. It may be asked—how do the Fabers make lead-pencils without the famous graphite from Cumberland? It appears that twenty years ago John Peter Alibert, a Frenchman, resident in Asiatic Siberia, having heard of the gold discoveries in California, began to examine the sandy beds of various rivers flowing into the Arctic Ocean. He found samples of pure graphite, evidently brought a considerable distance by force of the stream, in one of the mountain gorges near Irkutsk, and pursuing his discovery, tracked back to a branch of the Salan Mountain range, on the very summit of Mount Batougol, 275 miles west of the town of Irkutsk, near the Chinese frontier, in the midst of the rocky desert, and found pure graphite. After years of costly labor, Alibert found an exhaustless deposit of graphite equal to the best ever taken from Cumberland. Besides decorating and rewarding him, the Russian government changed the name of Mount Batougol to that of Mount Alibert. Nearly every crowned head of Europe has honored him. With the consent of the Russian government, Alibert now supplies Faber's house exclusively with graphite from the mine in Asiatic Siberia. Pencils of this material were first made by Baron Faber, in 1861, and were not introduced into the American market until 1865, from which time artists and others perceived and acknowledged their superiority. If the world were to endure a thousand years more, there is sufficient graphite in Mount Alibert to supply its population with good black-lead pencils.—Philadelphia Weekly Press.

FANNING CHAIR.—A New Jersey man has patented a chair which can be converted at will into a rocking chair; and which moreover by its rocking rotates a fan for the comfort of the occupant.

THE Consolidated Virginia Mining Company has increased its capital stock to \$3,480,000, divided into 11,600 shares, of the value of \$300 per share.

FIRST (?) MECHANICAL CONTRIVANCE.—It has been supposed by some that the balance beam and scales formed the first strictly mechanical contrivance known to mankind, and that this led to its being placed among the signs of the Zodiac. However that may be, the great antiquity of that apparatus is unquestionable, and although the Bible does not of course give us any actual description of it, we have in the sculptures of the ancient Egyptians distinct representations of such apparatus, constructed almost precisely as that in use at the present day. In one of the numerous sculptures found at Thebes, for example, there is represented a pair of scales, of which the beam is suspended by rings from a short arm projecting from an upright pillar, the scales being each connected to the beam by three cords, and a pointer projecting downwards from the center of the beam, by which, in conjunction with a plumb line, it can be seen that the scales are evenly balanced. An excellent engraving of this figure is given in the magnificent work entitled "Description De l'Egypte," published in France by the order of the Emperor Napoleon the First, a copy of which is now in the library of the Patent Office; the same work also containing engravings of other sculptures in which the beam and scales are represented, in some instances, without the pointer and plumb line. In one case a man is represented as weighing a small animal somewhat resembling a kid, the weights used being apparently in the form of rings.

HOUGH'S BAROMETER.—G. W. Hough, Director of the Dudley Observatory at Albany, stated at a late meeting of the American Association for the advancement of Science, that the observations made during the past year with his self-recording barometer, confirmed the opinion advanced by him at a previous meeting, that the barometric column is restless during a storm which may not be within several hundred miles of the instrument. The number of minute oscillations of the column, taken in connection with the movement, apparent to the eye, will indicate the comparative severity of the storm. It is probable that 100 similar instruments, properly distributed across our continent, would record the atmospheric changes with such minuteness that new and important generalizations might be arrived at.

ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

Patented Nov. 1st, 1861; July 24, 1866; and Oct. 9, 1866.

Awarded the First Premium at the Paris Exposition.

ADAPTED
FOR

Smelting,
Foundry,
Mining
and
Steamships.

REQUIRES

Fifty Per Cent.

LESS POWER

Than any Blower

now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver mine; Gridley's Foundry, Gold Hill, Nevada; Alma Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

Eley's Ammunition.

These Cartridges are made in three sizes, viz., .57 (or Snider Enfield) bore; .500 (or half-inch) bore; and .451 (or small) bore.

These Cartridges have been adopted, after careful comparative trials against all other descriptions, by HER MAJESTY'S WAR DEPARTMENT, as the Standard Rifle Ammunition for the BRITISH ARMY, and are not only used exclusively for the Snider Rifle, but are adapted to all other systems of military BREECH LOADING RIFLES.

They are the cheapest Cartridges known, carrying their own ignition, being made wholly of metal, are water-proof and imperishable in any climate.

Boxer Cartridge Cases (empty), of all sizes, packed with or without bullets, and machine for filling same in Cartridges.

Makers of BOXER CARTRIDGES. .450 bore for Revolving Pistols, in use in Her Majesty's Navy.

PIN CARTRIDGES for Lefauchaux Revolvers of 12 x, 9 x, and 7 x, bore.

CENTRAL FIRE and PIN FIRE CARTRIDGES, for all sizes of Guns, Rifles and Revolvers.

Double Water-Proof and E. R. Caps. Wire Cartridges for killing game at long distances. Felt Wadings to improve the shooting of guns; and every description of Sporting and Military Ammunition.

Wholesale only.

General Agent Pacific Elastic Sponge Company, 617 Market Street, San Francisco. 19v163uow

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

THE CELEBRATED Self Generating Portable Gas Lamp.

Directions for Use.

Charge the reservoir with the prepared fluid, or with Benzine, from half to three-fourths full; allow a portion to run through into the cup, then turn off the tap and ignite the fluid, which will heat the burner sufficiently to generate the gas, which will be seen issuing from the top. The tap must now be turned on, and a steady light will be maintained till the whole of the contents of the reservoir is consumed.

A small needle, bent at the point and fixed in a holder, may be occasionally required to clear the minute hole through which the gas issues, and the regulating screw at the bottom turned a little back; but care must be taken not to force the screw too high, and it should never be used to extinguish the light—by turning the top off, it will gradually go out.

When necessary to renew the cotton which is placed in the lower pipe to prevent the too rapid flow of the fluid, the lamp should be placed in a vise and the burner screwed off. The burnt cotton must then be withdrawn, and a fresh piece of stout cotton rag, one inch wide and four or five inches long, should be doubled over a piece of wire, and inserted into the pipe—the ends cut short off; the burner again screwed on with a little white lead, and the lamp is ready for use.

Manufactured solely by JOHN J. HUCKER, original proprietor, Factory, North Beach, San Francisco; and for sale by his agents in every city and town throughout the State. 19v143m-5

Hose and Belting.

Fire, Hydraulic Hose and Leather Belting, made of the heaviest and best quality of Oak-tanned Slaughter Leather. Also, Fire Rackets, Suction Hose, etc. Our Belting is well stretched, cemented and warranted to run true, and our Hose guaranteed to give satisfaction. A large assortment always on hand and orders promptly filled. No. 801 Battery street, San Francisco. 19v16 3uow

HYDRAULIC MILKING MACHINE.—The *Scientific American* illustrates a machine by which any number of cows may be milked at once, by steam or other power. Only one man is required to tend the machine. The cows rather enjoy it. They walk up and put their heads between stanchions, which are then closed by pulling a cord. The four rubber test-cups, which are attached to an arm moving on a pivot, are then turned into place, as one turns his gas burner into a desired position. A small pump, worked by the machinery, is then set in motion. When the operation is completed, the attendant turns aside the arms, and pulls the string. The cow passing directly on between the stanchions, goes on her way rejoicing; permitting the next in order to step forward into her place.

As if by magic comes repose,
Forget thy pain, forget thy woes.

This harmless Remedy stops all pain instantly, and leaves no stain. The tongue cannot mention any physical pain that this fluid will not remove in five minutes. Whether a frightful burn, a grating cold, or a simple mosquito bite, the result proves an entire relief from distress at any spot or place where applied. It is perfectly adapted not only for all pain, but also permanently cures the worst Ulcers, Piles, Glanders, or breaking out on any part of the body, and all internal complaints, by an outward application to the parts affected.

MOORE'S PAIN ANNIHILATOR, a standard remedy for Catarrh, Cold in the Head, Inflamed Eyes, etc., sold by all druggists.

O. H. MOORE, Inventor and Sole Proprietor, 632 Market street, San Francisco, Cal. 21v16-3m

Save Your Teeth.—Drs. Jessup & Beers, over Tucker's jewelry store, are now making a specialty of filling the fangs of Dead Teeth, and building up broken crowns with pure gold—thus restoring them to their original usefulness and beauty. They are also using Nitrous Oxide for the painless extraction of Teeth, when so desired—the only absolutely safe anesthetic ever discovered. In breathing it, it acts as a gentle stimulant, without undue excitement—the sensation produced being truly delightful, the effect upon the lungs beautiful, and in its results positively free from all danger. Prepared and administered daily at the Dental Rooms of Messrs. JESSUP & BEERS, corner Mont gomery and Sutter streets, San Francisco. 16v16f

Co-Operative Union Store.—This is becoming one of the most useful Institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions 20 per cent. cheaper than ever before, and the very best articles in the market. The store is located at 115 Sutter street, Lick House Block, San Francisco. 6v16-aim

SCREWED BOOTS.

LUMSDEN'S CALIFORNIA APPARATUS

FOR THE MAKING OF

SCREWED BOOTS.

Patented Feb. 21st, 1863.

PRICE, \$50.

With this cheap and valuable invention, Boots and Shoes can be made on lasts, with or without being plated, in any style that is required. The State Right will be disposed of at figures that will afford the purchaser an opportunity to realize a fortune.

For particulars apply to

NICHOLAS LUMSDEN, Inventor,
Nevada House, 51 Stevenson St.,

Pacific Mail Steamship Co's

STEAMSHIPS FOR

NEW YORK, JAPAN AND CHINA.

LEAVE WHARF, CORNER OF FIRST AND
Brannan streets, at 11 o'clock A. M. of the
following dates, for PANAMA, connecting via Panama Rail-
road, with one of the Company's splendid steamers from
PANAMA for NEW YORK.
On the 6th, 14th, 22d and 30th of every month.
Steamer leaving San Francisco on the 6th touches at
Manzanillo. All touch at Acapulco.
Departure of the 14th is expected to connect with the
French Trans-Atlantic Co's steamer for St. Nazaire, and
English steamer for South America. Through tickets can
be obtained.
Departure of 14th is expected to connect with English
steamer for Southampton and South America, and Australia,
and P. & R. Co's steamer for Central America.
Through tickets can be obtained.

STEAMERS FOR JUNE, 1868.

The following Steamships will be dispatched on dates as
given below:

June 6th—CONSTITUTION.....Capt.
Connecting with HENRY CHANCEY, Capt. Gray.
June 13th—GOLDEN CITY.....Capt. Wm. F. Lapidge,
Connecting with OCEAN QUEEN, Capt. Bradbury.
June 20th—GOLDEN AGE.....Capt. E. S. Farnsworth,
Connecting with KISSING STARR, Capt. Conner.
June 27th—SACRAMENTO.....Capt. Wm. H. Parker,
Connecting with ARIZONA, Capt. Maurv.
Cabin passengers berthed through. Baggage checked
through—100 pounds allowed each adult.
An experienced Surgeon on board. Medicine and attendance
free.

These steamers will positively sail at 11 o'clock. Passen-
gers are requested to have their baggage on board before 10
o'clock.
Through Tickets for Liverpool by the Cunard, Inman and
National Steamship Lines, can be obtained at the office of
the P. M. S. Co., San Francisco, where may also be ob-
tained orders for passage from Liverpool or Southampton
to San Francisco, either via New York or St. Thomas—if
desired an amount of \$20 to \$25 will be advanced with the
above orders. Holders of orders will be required to identify
themselves to the Agents in England.

The Steamship GREAT REPUBLIC, Capt. S. Doane, will be
dispatched June 3d, at 12 o'clock, noon, from wharf, corner of
First and Brannan streets, for YOKOHAMA and HONG
KONG, connecting at Yokohama with the steamer COSTA
RICA for SHANGHAI.
For Merchandise and Freight for New York and way
ports, apply to Messrs. WELLS, FARGO & CO.,
for passage and all other information, apply at the Pacific
Mail Steamship Co's office, corner of Sacramento and
Lafayette streets.

Order Bussey's Combination Burglar and Powder-Proof Keyless Lock!

REASONS WHY.

- 1st. It is the best Combination Lock known.
- 2d. It is impossible to pick it.
- 3d. It can be subjected to over half a million changes, and when run by a burglar, he is no nearer entrance than when he began.
- 4th. It has no key to lose.
- 5th. The more it is used the better it is liked.
- 6th. It has no signs, letters or figures, on its face.
- 7th. It is the simplest to understand.
- 8th. It is impossible to open it without knowing the set.
- 9th. It is least possible to get out of repair, as any one will be convinced on examination.
- 10th. It is the strongest Lock.
- 11th. No possible derangement of combination can be made.
- 12th. Amador County has adopted this Lock for its safes.
13. It received a special premium at State Fair.

Opinions of the Press and others in regard to Bussey's Combination Lock.

The Bank of British Columbia ordered the first one of these locks introduced in this city, and the following recom-
mendation has been received by the inventor:

BANK OF BRITISH COLUMBIA,
San Francisco, May 24, 1866.

Recently, two of Wm. C. Bussey's new Patent Com-
bination Burglar-Proof Locks were placed upon the vault
doors of the Bank of British Columbia. They are found
to operate with all the efficiency claimed by the inventor
and in every way meet our fullest approval.

They were ordered upon mature deliberation, after
strict investigation of their merits, in comparison with
some of the most noted and popular old styles of combina-
tion locks.

We deem the lock entirely burglar-proof. It is strong
in construction, without intricate or delicate parts, with
simple and easy movement. We find no difficulty in
either opening or closing it, nor in changing its combina-
tions, which may be made almost innumerable.

As a California invention of extraordinary merit, we
take pleasure in recommending it to public attention, be-
lieving it to possess all the advantages which are claimed
for it.

WM. H. TILLINGHAUST, Sub-Manager.

We do hereby certify, that Wm. C. Bussey's Combi-
nation Lock is the best Safe Lock in existence, and impos-
sible to be picked. We have applied several to vaults
and Safes, to entire satisfaction to parties interested.

RITZREGE & LEAVITT,

Pioneer Iron Works, cor. Fremont and Market sts.

SAN FRANCISCO, May 6, 1867.

I do hereby certify, that Mr. Wm. C. Bussey's Com-
bination Lock is the simplest and strongest in construc-
tion, and the least possible to get out of repair; and for
Safes and Vaults in every other respect as good as any
other improved combination lock which I am acquainted
with.

JOHN R. SIMMS,

Vault Manufacturer, Oregon street.

JACKSON, April 27, 1867.

I, the undersigned, Sheriff of Amador County, do hereby
certify that I am using one of Wm. C. Bussey's Key-
less Combination Locks on my safe, which is made to
draw four bolts with facility. I believe the lock to be
the best lock ever invented, for the following reasons:

1st.—Because it is impossible for either burglar or ex-
pert to pick it.

2d.—The lock being constructed without a key-hole, it
cannot be blown to pieces by powder.

3d.—There is no possibility of deranging the combina-
tion by breaking off, or attempting to drive the knobs into
the safe. And it is in fact the nearest approach to per-
fection yet arrived at in the art of Lock making.

R. COSNER.

Attested by J. C. SIMPSON, County Clerk.

JACKSON, April 27, 1867.

The undersigned, Treasurer of Amador County, do hereby
certify, that I am now using one of Wm. C. Bussey's
Keyless Combination Locks. It is fastened to the outside
door of the Treasurer's Safe. I have no fear of any by-
stander gaining a knowledge of the set of the combina-
tion, when locking or unlocking the same. If I desire to
have access to the safe every few minutes, I can so adjust
the combination as to open this lock in two seconds of
time. I am exceedingly well pleased with the same, and
I deem this lock to be all that the inventor claims for it.

OTTO WALTHER.

Attested by J. C. SIMPSON, County Clerk.

CALIFORNIA LOCK ARCADE.—A special premium was
awarded Mr. W. C. Bussey, for his superior Combination
Powder and Burglar-Proof Safe Lock, at the recent State
Fair. We are sure no award more meritoriously
bestowed. This Lock was described at length in the
Press several months since. At that time it was adopted
by several banking houses in this city, and we are now
assured that the remarkable claims asserted in favor of
the Lock at that time, have been confirmed since by its
practical use. We feel an interest in this California in-
vention, and wish to see it speedily meet with the success
it is ultimately certain to attain. Mr. Bussey, having
properly first fairly tested his lock in California, is now
desirous of introducing it in the East, and offers to dispose
of the right for several States at very reasonable rates.—
[Mining and Scientific Press, Sept. 29, 1866.]

They are the only SAFE lock ever invented. Every
State and County treasury vault, and every bank and busi-
ness place should have one.—[Amador Ledger.]

This is a lock in which a series of rotating annular
tumblers is employed, and it consists in a novel arrange-
ment of such tumblers in connection with one or more
arms connected with one or more bolts, whereby an ex-
tremely simple and efficient lock is obtained, presenting
an almost unlimited number of combinations. For which
he was awarded a special premium at the State Fair.—
[Sacramento Union.]

We, the undersigned, practical Locksmiths, unhesita-
tingly pronounce Bussey's Improved Combination Burglar
Proof Lock to be the most reliable lock constructed.

Any good blacksmith can put this lock on safe doors,
Boxed or single old locks removed and this placed in their
stead, to work one, two, three or four bolts, as the case
may be.—[See page 30 in Pacific Coast Directory.]

A deaf or blind man can open this lock when he knows
the set and understands the full manipulation, without
any expert detecting the combination.

Æsthetico-Neuralgicon.

We give below a representation of Von Eisenberg's "Æsthetico-Neuralgicon." It is designed for the administration of medicines in the state of vapor or extreme atomization. The construction of the apparatus may be made intelligible by a few words of explanation. The double pump

state of solution. Each is, by the admission of the aforesaid medicated vapor, still farther modified in its character. From these vessels lead flexible tubes, furnished with discharge-pieces of different forms,—according to the different uses for which they are intended, as for the eye, the ear, the head, the nasal organ, the throat, chest, or lungs. Those to be used as inhalers,

form upon the nerves;—the recognized source of many diseases.

Many of the most vital organs of the human frame can not at all, or only with the utmost difficulty, be reached by medicines in the ordinary form, either liquid or solid. Thus the lungs are shut up in a bony chest, and access can be had to them only through the wind-pipe, which is

od of administering remedies has obtained quite a large use in France and in several other European countries, and has been to a greater or less extent introduced in the Atlantic States.

The inventor of the apparatus herewith illustrated, Dr. Von Eisenberg, is said to have received his early professional training in some of the leading European con-

DR. VON EISENBERG'S "ÆSTHETICO-NEURALGICON."

on the right of the picture is for the purpose of forcing atmospheric air into a large cylinder underneath the floor, described as capable of containing some two hundred and fifty pounds of condensed air. From this cylinder it passes into another chamber, which is impregnated with the medical vapor. Thence it is admitted into the reservoir seen under the arch in the middle of the floor; and thence, again, by tubes, to the various glass vessels upon the table at the left of the picture. These glass vessels are said to contain each its separate and independent medicinal preparation, in the

are, for instance, tipped with mouth-pieces; those designed for the application of remedies to the eye or ear, with a discharge of different form. These devices have attached to them gauges or indicators, by which it is said the quantity of vapor which the several patients consume at each operation can be accurately determined; thus enabling the operator to graduate the necessary doses as may be deemed advisable. In addition to ordinary applications, as above, the apparatus is also well calculated to bring any desired remedies to act directly, and to the best advantage, in their atomized

guarded by a valve so constructed that it will not allow any liquid or solid to enter it. Many things, such as chloroform and some other extremely volatile substances, can be readily brought into contact with the lungs by the ordinary means of a saturated handkerchief; but there are many others, less volatile, which it is often desirable to apply thereto, which can only be employed by some more elaborate process of artificial volatilization or atomization. It is in the administration of such remedies that devices of this description are particularly important. This meth-

tinental schools of medicine. He has been for some years engaged in this particular branch of practice in New York, and is now briefly sojourning in this city with a view to its introduction here. We understand that his stay here will be short; but during the time he remains, he is willing to treat professionally such as may visit him at his rooms.

THE RAILROAD TRACK-LAYER.—We understand that this extraordinary labor-saving machine is still working with marked success, in its work of track-laying along the line of the Vallejo Railroad.

Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

Mammoth District, Nevada.

IMPORTANT MINERAL DISCOVERY.

EDITORS PRESS:—It seems scarcely just that the only journal devoted to the mining interest of the Pacific Coast should be without a correspondent at this new El Dorado; I therefore volunteer to take your case in hand for the present. The great lode recently found here is pronounced by all one of the wonders of the silver era. Of course it is estimated variously by the hundreds who have visited it, but all agree that there is a vast amount of wealth in sight, while many say without hesitation, that it is a most extensive and fabulously rich discovery. The Marble Falls Lode was discovered on the 25th of April, by A. T. Hatch, who attributed his good fortune directly to especial Providence. Having made all arrangements to join a party who were about to visit the gold region, south, near the Arizona line, he was detained by circumstances beyond his control. Chagrined at this disappointment, he shouldered his pick with the determination of finding a gold mine of his own, which he accomplished most successfully, as the sequel will show.

Its locality is in the north west corner of Mammoth District, $3\frac{1}{2}$ miles distant from the town of Ellsworth, eight miles north of the Wellington road, and twenty-two miles south of the Overland road (opposite West Gate). The first question by visitors is, why has this thing remained so near an old settled mining district without its value being discovered sooner? One answer may be, that the eastern part of Mammoth District abounds with argentiferous lodes that are satisfactory to the owners, who have remained content with their first discoveries, with but little inclination for further prospecting; while the district has never had the sensational reputation that others have, leading to a thorough exploration. Even the neighboring districts have been unfriendly towards it,—a feeling evidently induced by jealousy. Now, however, it stands a head and shoulders above the most famous, and is in no need of their friendship, nor fear of their ungenerous or narrow-minded policy of depreciating all but their own. Again, the immediate vicinity of the lode is difficult of access, being situated under or below a fall of several hundred feet, from which it takes its name.

The outcrop is immense, and is discernible a mile distant; 2,000 tons of quartz would be a modest statement of the amount above ground. This extends 900 feet on its trend, and ranges from ten to fifteen feet wide, with occasional expansions to forty feet. The development on the original location is thus far limited to openings in the croppings at short intervals along its course, at each of which can be seen piles of ore sprinkled with gold and native silver, massive lumps of bromide and auriferous tellurides.

Its silver garners are of the most astonishing richness, assays and working tests coming under my own observation ranging from \$400 to \$3,200 per ton in silver; the first figures being a fair average of the richest silver chimneys, while the lower strata of the lode everywhere carries an abundance of good milling silver ore.

The deposits of free gold are confined to the upper stratum, varying from ten inches to three feet in width, and seem to be generally diffused and continuous the entire length of the outcrop. The gold is nowhere, very coarse, but at several openings is of great richness, in minute particles and delicate spangles. Much of the latter character will yield from \$3,000 to \$10,000 per ton. I have made some tests of the decomposed ore that yielded at the rate of \$20 per pound. Nor is this latter grade limited in quantity; there are numerous openings where it gives evidence of permanence. The richer portion seems to be a mass of decomposed pyrites, while the thread or wire gold is found in the harder portions. No complete analysis has been made of the gold, but it is estimated to be worth \$15 per ounce.

EXTENSIONS REAL AND SUPPOSED.

The excitement, as a natural result, has led to the location of extensions both ways, (N. W. and S. E.). In the former direction, the ground is claimed for miles, and many valuable claims are being opened.

The Montana Company own the first N. W. extension of 800 feet. The lode is blind or covered on this location, with the exception of a small outcrop near their N. W. boundary. The Marble Falls Company's croppings extending in full power and richness to within a few feet of the line, renders it almost certain that this claim is of great value.

As further evidence of this, the Marble Bluff Company, who own the second N. W. extension, have struck the rich ore beyond. There can be seen at their dump five or six tons of as rich silver ore as was ever found in Nevada,—excepting that taken from the Mexican claim on the Comstock, in the spring of 1860,—considering that no selection was made, none of the vein matter being rejected.

Further to the S. W., other locations have been made which are developing splendidly; of these the Piute Company have made the most progress in development; they have a large body of ore, rich in both gold and silver.

On the next location, owned by the Union Company, the ore is eight feet in width, which yields from \$80 to \$100 per ton. This ore may be best described as an argentiferous telluride of gold.

About midway of the original location, on the Marble Falls lode, the vein matter branches, diverging to the S. W. The first location on the southerly branch, is owned by the Marble Point Company. For some distance from where it would naturally intersect the main lode, the ore of this is of the most fabulous richness in gold, its parallel only being found in the richer chimneys of the Marble Falls. I am safe in saying of both, that nothing like it has ever been exposed, considering the extent indicated.

The next locations upon this branch are the Holman and Storm King companies, owned by parties from Ione. Here can be seen from three to five feet width of ore, thickly mottled with native silver. This ore, I am informed by the Superintendent, yields about \$320 per ton in silver, and contains, by fire assay, \$40 per ton in gold,—the latter metal is of course not obtained by the ordinary silver process of reduction. All the ores of this section seem to me peculiarly adapted to Kustel's process by chlorination.

Still farther S. W., locations are being made daily. Judging by the accounts given and the specimens brought in, this belt will prove one of the most extensive in Nevada. Taken in connection with the extraordinary richness of the Marble Falls lode and its extensions, it is the most important discovery since that of the Comstock lode. The miners and prospectors are at present camped temporarily at the numerous springs in the vicinity, there being no ample building ground in close proximity to the mines. A town site has been staked out by those who desire lots at the mouth of Marble Cañon. Owing to the scarcity of water at that point, there are no buildings or inhabitants there at present. It is designed to convey water in pipes from the Marble Falls Company's mill site, one mile above, where spring water is abundant, but building ground is limited to the requirements of the company. X.

THE INVENTOR OF THE COTTON GIN.—

A lady writer in one of the weekly papers of New York City states that the cotton gin—the invention of which has hitherto been generally attributed to Eli Whitney—was in reality invented by the wife of Gen. Greene, of Revolutionary renown. We shall next be told that the sewing machine was invented by the Emperor Sonlouque.

DISINTERESTED ADVICE.—In the darkest days of the Atlantic telegraph enterprise, a friend of Cyrus Field's bought ten thousand dollars of stock for a ten dollar bill. Mr. Field offered to take the stock at a considerable advance. "Well, but what do you advise me to do, Mr. Field?" "Take your stock home," was the reply; "look it up in your safe, and never look at it or think of it till you come to me for your dividends on it." And that man is now receiving on his investment of ten dollars, \$800 per annum in gold.

PHILADELPHIA ACADEMY OF NATURAL SCIENCES.—

The Directors have paid \$60,000 for a lot 283 feet on Nineteenth street, 183 feet on Race, fronting Logan Square, and 139 feet on Cherry street, upon which they intend to erect a commodious building.

Chromo-Lithography.

The fine specimens of this art which are being produced by Messrs. L. Prang & Co. of Boston, have called out expressions of approbation from such appreciative personages as Church, the artist, Bayard Taylor, Longfellow, John G. Whittier, and Mrs. Harriet Beecher Stowe, in autograph letters direct to Messrs. Prang & Co. Our readers will without doubt be pleased to read the following description of the process, from the New York Tribune:

Chromo-lithography is the art of picture-printing in colors; and, although not a very recent invention, it has been greatly modified and improved of late years. It might, with propriety, be called mechanical painting, as the colors are laid on one after another, mingling the different tints and shades until the picture is complete, in a manner analogous to painting with a brush; and, provided the men who undertake the work are skillful artists, there is no reason why a chromo-lithograph should fall short, in point of expression or delicacy, of the original painting which it is designed to imitate.

A few words on ordinary lithography will first be necessary in order to give the reader a clear idea of the chromo process. Briefly, then, a lithograph is a chemical drawing upon stone, the drawing being made with a greasy or oily ink upon the peculiar quality of limestone found in the quarries of Solenhofen, Bavaria. All other processes of engraving are mechanical, rather than chemical, as in wood or type work, where the impression is obtained from a raised design; or in copper and steel plate, where the design is made by deep incisions, into which the ink is rubbed. In the lithographic process, however, there is neither *relievo* nor *intaglio* design; the operation is dependent simply upon the chemical affinity existing between the greasy matter employed in the ink and that upon the stone, and the antagonism which this matter has for water, with which the stone is in all cases dampened before pulling an impression.

In chromo-lithography, the process is identical, except that a different stone is required for every color employed; and the ink used is a species of oil color, similar to that adopted by artists for painting. The number of stones used depends upon the number of colors required, usually varying between ten and thirty; and the time necessary to prepare these stones for an elaborate piece of work extends over months, and sometimes years. But the number of colors in any given picture is not always an indication of the number of stones employed as the colors and tints are multiplied by combination in being printed one over another; thus, in an engraving where twenty-five stones are used, there may be upwards of a hundred different shades of color obtained by this means. The amount of labor and detail involved in drawing the different parts of the design upon so many stones is almost inconceivable to one who is uninitiated. The *modus operandi* is as follows:

Upon the first stone, a general tint is laid, covering nearly the whole picture, and as many sheets of paper as there are to be copies of the picture are printed from it. A second stone is then prepared, embracing all the shades of some other color; and the sheets already printed with the first color are worked over this stone. A third, fourth, fifth, and sixth follow, each one repeating the process, and adding some new color, advancing the picture a step farther, until the requisite number of colors have been applied. The printing of so many colors, and the time required for drying each before the application of a succeeding one, involves months of careful and anxiously-watched labor. Great care and skill are required to perfect what is technically termed the "registering," or that part of the process which provides that the paper fall upon every stone in exactly the same position relatively to the outline. To attain this end, stout brass pins are fixed in a frame surrounding each stone. These pins penetrate the paper in making the first impression; and the holes thus made, being carefully placed over the pins in all subsequent impressions, insure the certainty of the outline on every stone falling into the same position on every sheet. At last, however, it leaves the press to be sized, embossed, varnished, mounted, and framed. The embossing is that part of the operation necessary to break the glossy light, and soften the hard outlines; a broken structure being given to the print by being passed through the press in contact with a roughened stone.

Effects of Great Heat Upon Different Substances.

After a large conflagration, which occurred some few years ago, in the city of Hamburg, Dr. Zimmerman read a paper before the Natural History Society of that city, on the "Effects of great heat upon different substances," the paper being the result of a careful series of observations made upon the "burned district." We extract as follows:

After the great conflagration there were abundant opportunities for examining the effects of high degrees of heat. There were bricks the surface of which were fused, and thus coated with enamel; lime had become brittle and loose, and reacquired its caustic property, pieces of granite burnt into fragments, and the surface of many square stones separated into thin layers. The bells were partly fused, at the same time becoming oxidized, and forming a slag and red copper ore. A portion of the fused metal broke through the vaults and entered the sepulchres, coating and filling the skulls and bones with metal,—and the bell-metal underwent a partial refining, the tin being separated by fusing, and the copper left behind in a porous state; steel became soft and condensed by glowing into a thick mass; iron, after being fused, formed a slag, and changed into a graphite-like substance, or even into magnetic iron-stone, which was found in the shape of crystalline octahedra; glass was frequently fused into a kind of enamel, but sometimes it was only fritted, had received a crystalline appearance, and resembled Réaumur's porcelain. A package of blue paper was entirely destroyed, but the smalt was left behind without undergoing any change, and found afterwards fused together into a lump.

A large collection of minerals was destroyed by the conflagration, affording a fine opportunity examining the effects of fire on such substances. The greater part of them was destroyed, being or fritted, especially the metallic minerals; the cobalt alone had been able to resist the influence of the intense heat, and the smalt had partially become harder and bright, in such parts where it was glazed or changed into a black carbonaceous substance. The sparry iron ore had preserved its crystalline form, but was transformed into brown iron ore; the green iron ore had indeed undergone the process of fusion, but still preserved its peculiar color. All the magnesian minerals resisted the red heat; garnets and opals remained unchanged; the iron garnet, however, lost its brightness and assumed a yellow-brown color; the diamonds were either entirely burnt or had become opaque and smaller. Black mica and chlorite schist became of a golden yellow, and silicious sandstone was changed into opal, clay into porcelain jasper, flints became white, fused with iron into a breccia, or were coated with a green enamel.

Another remarkable circumstance is, that the footpaths and roofs covered with asphalt did not ignite, and that the ground underneath the amoldering ruins which, for a whole fortnight—in some instances for eight weeks, or even three months—remained red hot, was so little affected by the heat, that an ice-cellar was found filled with undissolved ice.

MICROSCOPIC EXAMINATION OF ALTERED

NOTES.—Dr. E. H. Parker recently gave an account, before the New York Medical Society, of certain cases of forgery in which he had been called as an expert, and made use of the microscope to detect fraudulent alterations in certain valuable papers. Dr. Squibb, in the same connection, referred to the following case: A number of U. S. bonds were stolen some time since from a party, and their payment stopped. For a long period nothing could be discovered in relation to them. Finally, however, two bonds with the same numbers were found in Wall street, and it occurred to the parties concerned that one of these must be of the lot that had been stolen. The difficulty was to decide which was the genuine, and it was cleared up by a microscopic examination of the ruled lines upon which the figures were written in red ink. The magnifying glass showed the tracings of the old figures underneath the new, the red ink of the former having been previously removed by a chemical process.

IRON CURBING.—Pittsburgh is adopting this kind of curb. It consists of an inch plate, eighteen inches broad, pierced with holes, and having a corrugated flange at the top. The plate is imbedded perpendicularly beside the pavement, and the flange extends on the surface several inches to meet the bricks.

Mechanical.

CAST IRON WITH WOLFRAM ALLOY.—We have already spoken of the improvement in steel by the addition of tungsten, making puddled steel fit for the uses to which cast steel is adapted. Puddled iron may also be treated in a similar manner, giving an iron of great strength and toughness, suitable for wire, sheet-plate, or other articles requiring tenacity. Cast iron also is greatly improved by the same addition. The following, from a communication to the *Colliery Guardian* of April 25th, describes the manner in which the mixture is effected, by the use of wolfram: The pulverized wolfram ore is inclosed in paper bags, in proportions of four to five pounds, together with the manganese and ordinary salt, the manganese to be twenty per cent. of the weight of the wolfram ore, and the salt ten per cent. After the raw iron, destined for casting ordnance, cannon balls, rollers, machine axles, etc., is smelted in the puddling furnace, the above mixture is thrown gradually into the fluid mass, through an aperture in the furnace door, and stirred up and distributed by means of an iron bar. During this operation the draft must be excluded by closing the furnace. Then the fire must be well stirred up, and the iron mass be kept during half an hour in a state of strong fusion. At first the wolfram ore is reduced at the cost of the carbonic ingredients of the iron, when the chemical working of the wolfram begins. To produce raw iron of great firmness it will be requisite to employ a wolfram alloy of $\frac{3}{4}$ to $1\frac{1}{2}$ per cent., according to the chemical composition of the former. This alloy is recommended for the manufacture of pieces of ordnance, cannon balls, axles and other portions of machinery, as well as for propelling screws, and fine cast-iron wares, such as screws, small cog-wheels for spinning machinery, and all sorts of tempered articles. When employed in the manufacture of rollers, which should be very strong and retain a very hard surface, the wolfram alloy should be increased up to five per cent.

PENNSYLVANIA STEEL AND IRON WORKS. The Sheffield Steel Works, owned by Singer, Nimick & Co., at Pittsburgh, Pa. are among the largest in this department of manufacture in the country. They run night and day, employ 250 hands, and have a capacity of fifteen tons of steel per day. Five engines and seven boilers supply steam power. The firm make steel springs and axles on a large scale. They are now building the largest sheet mill in the Union for rolling steel, which will contain the largest chill rolls in the world. This new mill, which will be used for rolling circular saws, four to six and a half feet in diameter, plate, slab and sheet steel, will be in operation in September.—*Iron Age*, May 1th.

In the foundry of the Port Richmond Iron Works, of Philadelphia, are three cupola furnaces, the largest of which will melt twelve tons of iron per hour. In the machine shop of the same establishment there is a planing machine capable of planing casting eight feet wide, six feet high, and thirty-two feet long; a lathe that will swing six foot long, and turn a length of thirty-four feet; and a boring mill, believed to be the largest in America or Europe, that will bore a cylinder sixteen feet in diameter and eighteen feet long.

NEW ALLOYS OF LEAD AND TIN.—M. Plho describes two new alloys containing less tin than ordinary pewter, which are not acted upon by boiling acetic acid or by salt water. The first contains 1 part of tin and 2.4 parts of lead. It has a density of 9.64 and melts at 320° Fah. It is made by first melting the lead, and, after skimming it, gradually adding the tin; by stirring it constantly with a wooden stick in the mean time, the lead is prevented from settling to the bottom. The second alloy consists of 1 part of tin with 1.25 of lead. It is less malleable and more brittle than the first.

ALLOYS OF COPPER AND IRON.—Copper and iron may be melted together in almost all proportions, but it appears to be doubtful whether any homogeneous alloys can be produced. A small quantity of iron, added to bronze or brass, causes a considerable increase in tenacity. Malleable iron or steel containing copper to the extent of 0.45 or 0.50 per cent., shows symptoms of red shortness, which become decided with a larger quantity.

THE MAKING OF MORTAR.—Joseph Dy-sart of Altoona, Pennsylvania, sends the following to the American Institute Farmer's Club: "So far as my observation extends, none of our builders, masons, bricklayers, or plasterers, understand the nature of the action of limo upon sand, in the making of mortar. I make no pretension to be scientific upon the subject, but from all I can gather, I take it for granted that the action of caustic lime on the silica or sand produces a silicate of lime, which is the binding principle in common mortar. If this be true, it is clear that the longer the limo and sand can remain mixed, in the condition of mortar, sufficiently wet to enable the lime to act on the sand, the more of this binding principle will be produced; but instead of this, mortar is generally used soon after it is made. It is common for plasterers in preparing their finishing coat, to slack their lime and let it stand, as they say, to cool, for a long time before using it, but if they mix whatever sand they put in it at once, so as to have the lime act on the sand, to produce the silicate of lime, they would not only make a much better job, but it would work easier, having lost that fiery nature that plasterers in this neighborhood complain so much of; and it would not be near so liable to crack."

MELTING METALS IN METALS.—In a recent lecture on alloys by Dr. Matthiesen, in order to illustrate the difference between chemical combination and the solution of metals in metals, the lecturer plunged a rod of gold and another of copper into separate portions of molten tin contained in small crucibles heated by the flames of Bunsen gas-burners. The gold combined rapidly with the tin; but the copper rod, though previously tinned to insure perfect contact between the two metals, was not perceptibly affected. To appreciate the importance of these phenomena we must remember that the fusing points of gold and copper are almost identical, and far higher than the fusing point of tin. By a modification of the experiments performed with the molten tin, the difference in the behavior of gold and copper was exemplified in a still more striking manner. A gold rod superficially tinned, when held in the gas flame, melted at once like a rod of pure tin, while a tinned copper rod exposed to the same temperature remained unaffected as a whole, though the coating of easily fusible tin melted.—*Am. Artisan*, May 6.

IMPROVED FURNACE.—The *Loudon Mining Journal* of April 11th, thus describes a recent improvement on Juckes' furnace: The improvements consist in the use of two endless chains, running longitudinally one on each side of the furnace, which are connected by portable rods at suitable distance apart. The grate bars are hinged at one end only to these rods, the other end of each being loose, and so formed as to rest upon the hinged end of another, when in proper position in the furnace, but when passing out of the furnace into the ash-pit, they tumble over, or drop open, and thereby clear themselves from clinkers; and in order that this clearing may be more effectual, they place stops at suitable intervals, which only allow them to drop one by one. This construction and arrangement will admit of any bar being readily removed and replaced without deranging the furnace; it also gives ample air-opening, with easy means of cleaning and repairing.

TROY IRON TRADE.—Since January, 1867, wrought iron has declined from fifteen to twenty dollars per ton of 2,240 pounds, this decline being in a much greater ratio than that of the coal and pig iron employed in its production. The wages of the operatives were retained at former figures until the first of December last, at which time proposals were made to those workmen receiving wages greater than those of ordinary laborers, looking to a reduction of from ten to twenty per cent. Owing to the crisis and the impossibility of otherwise continuing work, these terms were acceded to, and labor at the reduced rates recommenced about the middle of January last. The rolling-mills of the city continue in full operation, generally to supply orders, although in some cases the products are being warehoused, in the hope of an increased demand.—*Troy Times*.

RUSTING OF POLISHED STEEL.—It is said that nothing is equal to pure paraffine for preserving the polished surface of iron and steel from oxidation. The paraffine should be warmed, rubbed on, and then wiped off with a woollen rag. It will not change the color, whether bright or blue, and will protect the surface better than any varnish.

Scientific Miscellany.

Man Began at the End of the Ice Period.

At a recent meeting of the Boston Society of Natural History, Prof. Agassiz made some remarks upon the antiquity of man, from which we quote the following:

There is no doubt that the fauna of the diluvial deposits and of the European caves consisted of animals, some of which, at least, had a circumpolar geographical distribution, and that the southern limits of animals now living in the polar regions was once much greater than now; remains of the reindeer have been found all through France to the Pyrenees and in Southern Germany. We find that these mammals had intimate relations with the ice period, and it becomes necessary for us to investigate the extent of the ice-fields at the time when the glacial period was at its height. He believed that the changes in extent which our ice-fields have undergone during successive periods, would furnish us with data for our chronology. In America, the ice-fields, at the time of their greatest extension with indefinite limits, reached the 32d degree of north latitude. In Europe they extended as far as the plains of Lombardy. Subsequent to this came a limited glacial period, in which the Southern and Middle States were freed from glaciers, but from Maine westerly the country was still ice-bound. During a third period the ice retreated to the northern shores of Lake Superior and the slopes of Mt. Katahdin, while in a fourth period, the one before the present, the continent was clothed with vegetation up to the hilly parts of Canada.

In answer to the question whether we had any means of connecting chronology with these facts, it might be stated that none of the cave animals or the large mammals which have been mentioned, have been proved to exist prior to the time of the greatest extent of the ice-fields, and, as it can no longer be doubted that man lived contemporaneously with these animals, he believed that, with the waning of the ice period, began the era of primeval man. In the successive epochs of the ice, indicated by the retreating ice, we have a relative chronology; when we ask for more specific statements of age, we find ourselves at once at a loss for an answer. Some indications might be seen in the abrasions of rocks of unequal hardness, and instances were cited in illustration of this.

In the course of the discussion which followed these remarks, Prof. Agassiz said he hoped for great results from the investigations now undertaking in our own country, and believed that marks of the reindeer would yet be found in the Carolinas.

PALEOTROCHIS.—In 1856, Prof. Emmons announced the discovery of some peculiar fossil corals in North Carolina, to which he gave the above new name, they being apparently of a new genus. Shortly afterwards, Prof. James Hall suggested to Prof. Dana that these specimens were not corals at all, but merely concretions. This was controverted by Prof. Emmons, who maintained their organic character. In *Silliman's Journal* for March, Prof. O. C. Marsh of Yale College, has an article upon the subject, in which he declares their decided inorganic nature, as made plain by careful examination under the microscope. He suggests, therefore, that the name *Palaeotrochis* be in future dropped from the genera of fossils.

CARBONIZATION OF WOOD.—M. Gillot, in his memoir to the French Academy of Sciences on this subject, says the only condition essential for the production of good charcoal, is that the operation shall proceed slowly. The decomposition of wood commences at about the boiling point of water. During the decomposition, the production of carbonic acid causes a development of heat in the retort greater than that outside of it, when the heat applied approaches 300° C. Too rapid an increase of internal heat gives rise to the formation of tar and gaseous products, diminishing in a corresponding degree the useful accessory products, as well as the yield of charcoal. The condensed products contain the largest proportion of acetic acid (about 48 per cent) when the temperature of the oven is 218° C. In this way a given amount of wood will yield about two-thirds its weight of charcoal, and 7 or 8 per cent. of acetic acid.

AMMONIA IN COAL GAS.—Dr. Guuning, of Amsterdam, has made experiments which prove that there is over one cubic foot of ammonia in every thousand cubic feet of coal gas; and that even when it is carefully purified. He calls attention to the fact that where wet gas-meters are in use, the water, being rarely if ever changed, must in time become fairly saturated with ammonia. A meter used for two years in the laboratory at Amsterdam, with a capacity for fifty-seven gallons of water, held no less than nine pounds. Since coal gas also contains sulphur compounds, there is formed sulphate of ammonia, which, converted by the intense heat into bisulphate of ammonia, attacks the glass cylinders, or chimneys, placed on the Argand gas burners.

TROPICAL PLANTS IN POLAR REGIONS.—Prof. T. Sterry Hunt considers as unsatisfactory the ingenious hypotheses proposed to account for the warmer climate of ancient times, and thinks that the true solution of the problem is to be found in the constitution of the early atmosphere, when considered in the light of Dr. Tyndall's researches on radiant heat. He has found that the presence of a few hundredths of carbonic acid gas in the atmosphere, while offering almost no obstacle to the passage of the solar rays, would suffice to prevent almost entirely the loss by radiation of obscure heat, so that the surface of the land, beneath an atmosphere rich in carbonic acid, would become like a vast orchard house, in which the conditions of climate necessary to a luxuriant vegetation would be extended even to the polar regions.—*Mechanics' Magazine*.

UPHEAVAL OF THE LAKE-BEDS.—Professor John Gregory, of Milwaukee, writes to the *Nevs* of that city that the beds of Lake Superior and Michigan are periodically upheaved by igneous action. He says: "As there is no reason why this internal igneous force should communicate at equal intervals of time, we cannot expect a recurrence of the above phenomenon at the end of equal periods. Our rivers show ample evidence of this upheaving force, as they are all of considerable depth for some distance from the lakes—a condition of things that could not exist under any other circumstances than that of an upheaving force—which would necessarily drive back the elevated surface waters into the rivers, just as we see them at different points where the rivers discharge themselves into the lake."

POLARITY ACQUIRED BY POSITION.—It may not be generally known that iron vessels, built on stocks pointing nearly north and south, become highly magnetic, and are, in fact, mariner's compasses on a large scale. This effect is due to the vibration of the plates which is necessarily produced by hammering the iron when in this position. A common poker treated in the same way will readily become a magnet. This curious fact was recently illustrated by the British ship of war *Northumberland*. Having been built with her head pointing north, her compass showed great deviation. By docking her, however, with her bow pointing south for some time, it was found that this effect was greatly reduced, and it may be in time wholly neutralized.

THE MASTODON IN SOUTH CAROLINA.—We learn that Capt. C. O. Boutelle, of the U. S. Coast Survey, whilst making explorations in the neighborhood of St. Helena Islands, S. C., recently unearthed a huge mastodon, lying in a bed of marl. The skeleton was perfect, but a portion of the bones very soft, while other parts are petrified. The bones are of enormous size. Prof. C. U. Shepard, of the South Carolina Medical College, and his son, the Professor, who recently returned from Europe, will exhumate the monster and bring it to this city. It is the first mastodon yet discovered on the Atlantic coast, though it has heretofore been met with in the West.—*Charleston Courier*, April 6th.

Fossil REPTILE FROM KANSAS.—The Philadelphia Academy of Natural Sciences has received from Kansas the bones of an enormous reptile embedded in crystallized gypsum, and is now engaged in chiseling them out and putting them together. The vertebral column is over thirty feet long, and the whole monster is believed to have been more than fifty feet in length. Prof. Cope pronounces it a hitherto unknown species of *saurian*.

SPONTANEOUS GENERATION.—M. Donné, who has so long supported this doctrine, has taken it all back. He admits that his latest researches, so far from confirming his former opinions, convince him of the correctness of the views of M. Pasteur, his old opponent.

Hughes' Atmospheric Quartz Crusher.

This is a new stamp battery which has recently been brought out from New York, and put in working order at the Fulton Foundry on Fremont street, in this city, where it may be seen in operation every Monday, Wednesday and Friday, between three and four o'clock p. m. This battery consists of four stamps; but it can be made of two or more. It is designed to answer the demand for a light, cheap and effective battery, to take the place of the heavier and more clumsy make in ordinary use. The principle of its construction is that of the Hughes' atmospheric trip-hammer. Mr. Hughes constructed his first quartz mill on this plan, about two years ago, at Rochester, N. Y. The frame work is much on the plan of an ordinary battery, on the top of which are four upright cylinders, 10 inches in diameter, 16 inches deep, and open at the top. These cylinders are of cast iron, fitted with piston-heads of two thicknesses of boiler iron, between which are clamped ordinary leather pump-valves. The piston-rods, instead of constituting a part of the stamp-stems, as they do in all the steam stamps hitherto devised, fit into a socket in the top of the stems, in such a manner that when the blow is struck, there is no connection between the piston-rod and stamp. By this arrangement, the severe and destructive jar which accompanies every drop of a stamp, is entirely removed from the piston-rod as well as from the upper works of the battery. The stamps are raised by an improved cam, which appears to apply the lifting-power in a most advantageous manner.

When the stamp is raised, a vacuum is formed in the cylinder, and on the release of the stem from the cam the pressure of the atmosphere is brought to bear upon the piston-head, with a force which drives it down with an accelerated velocity, so as to produce a blow altogether disproportionate to that derivable from the weight and ordinary velocity of a falling stamp. The weight of the stamp in this machine is but 120 pounds; but when, in falling, the pressure of the atmosphere (which on a 10-inch cylinder and a perfect vacuum, is 750 pounds) is added to the weight of the stamp, we have 870 pounds, moving with a velocity at the delivering of the blows of a 11-inch stroke, which will give it a percussive force equal to from 8,000 to 9,000 pounds. A 750-pound stamp of the old style, dropping by the mere force of gravity through the same distance, will give a blow equal to only 3,000 pounds. The atmospheric stamp of 120 pounds, is forced through a space of about eleven feet in the same period of time which would be occupied by the ordinary 750-pound stamp in falling through eleven inches of space. The difference in effect is like allowing one hammer to fall upon the head of a nail by its own gravity; while another is driven down by a powerful muscular force exerted by the arm. The stamps of this machine are calculated to drop from 140 to 175 times a minute.

The machine is very simple in construction and easily kept in order. The cost is about \$400 to the stamp; with pulleys, working drawings, etc., complete—and will be guaranteed to do a given amount of work—something like from three to three and three-fourths tons to each stamp, for every twenty-four hours. The weight of a 4-stamp battery is about 5,000 pounds. It can be set up, after the foundation is prepared, and put in running order in twenty-four hours.

The first machine of this description, with two stamps of eighty pounds each, was put up on the Golconda mine, in Canada, over two years ago, and is said to be still running and crushing about five tons every twenty-four hours. We have seen letters which state that one of the machines in Virginia

is doing from three to four times the work of the ordinary stamp. These batteries are now in operation in Canada, North and South Carolina, Virginia and Georgia. We shall probably give an illustration of this battery at an early day. Drawings of the machine may be seen at this office. Mr. R. T. Hill, former owner of the Butte Mill, near Austin, Nevada, is sole agent for the sale and introduction of this battery on the Pacific Coast, and has had large experience in quartz mining and milling. A 2-stamp battery had been running continuously at Wyckoff's Reduction Works, at Green Point, opposite New York, for several months, until the late fire which destroyed their works. The works are now being rebuilt, and a 4-stamp battery will be put up in place of the former one of two stamps.

Annual Report of the Mercantile Library.

We have received the fifteenth annual report of the President, Treasurer and Librarian of the Mercantile Library Association. The report forms a pamphlet of forty-four pages, setting forth in considerable detail the present condition of the institution, and giving, in brief, the history of the various building projects, from that of 1853 until the present, which has finally culminated in the erection of the magnificent structure within which the library is now being arranged.

It appears that the present membership is 1,818. The books and fixtures of the Association are insured to the value of \$50,000, and the new building for \$60,000; which latter it is proposed to increase. The President objects to the creation of life-memberships, believing that the Association would do better to rely upon regular dues for its maintenance. The value of the building, when completed, with the lot, is set down at \$300,000, on which there will be a final indebtedness of less than \$200,000. The lot, which cost \$50,000, is now worth \$90,000. The President suggests that the debt should be carried in the shape of bonds, bearing a low rate of interest, and payable at some future day.

It is believed that in the future the income from the property in the shape of rents for the lower story, and the increase of resources from new memberships, donations, etc., will not only furnish all the interest money required, but will also provide for the ultimate extinguishment of the debt. The books, and all the personal property of the Association, are free from any incumbrance.

It has been impossible, since the building has been in progress, for the Trustees to devote any time or attention to special or extraordinary means to raise money to assist in the work; but it is hinted that in the future, as soon as the cares and responsibility of building are over, some of the means usually resorted to by public and benevolent institutions for raising funds, will be adopted to aid in the extinguishment of the heavy indebtedness which it has been found necessary to incur, to place the Association in their present state of independence and honorable position.

The report concludes with the annual statistical and classified account of books loaned. Under this head a comparison is made between the literary tastes, as deducible from these statistics, between the reading public of San Francisco and Boston; and from which it appears that while works on fiction comprise 68 per cent. of the books taken from the Boston library, the same class of books comprise 72 per cent. of those taken from the Mercantile Library of this city. It is remarked, however, in this connection, that two very important facts are generally overlooked by those who attempt a statistical estimate of the literary tastes of a community by the figures gathered from library registers. The first is that the most careful readers

and thinkers have in their own private libraries the more valuable works upon particular and useful subjects, and consequently do not depend on libraries for such reading matter. Secondly, a very large number of the more valuable works of all libraries are kept only for reference, and are not allowed to be taken away. Hence, a vast amount of the better class of reading is done in every community which does not appear in the usual library reports. We shall endeavor to give an illustrated description of the new library building in our next issue.

The State University.

The *ex-officio* and appointed Regents of the State University met on Tuesday last, and completed the filling up of the Board, by the election of eight additional members. The full list of Regents stands as follows:

Regents Ex-officio.—H. H. Haight, Governor of California; H. Holden, Lieutenant Governor; C. T. Ryland, Speaker of the Assembly; O. P. Fitzgerald, Superintendent of Public Instruction; C. F. Reed, President of the State Agricultural Society; A. S. Hallidie, President of the Mechanics' Institute. To serve during their respective official terms, varying from one to four years.

Regents Appointed.—Samuel Merritt, 2 years; John T. Doyle, 4 years; R. P. Hammond, 6 years; John W. Dwinelle, 8 years; Horatio Stebbins, 10 years; Lawrence Archer, 12 years; William Watt 14 years; S. B. McKee, 16 years.

Elected Members.—Isaac Friedlander, 2 years; Edward Tompkins, 4 years; J. Mora Moss, 6 years; S. F. Butterworth, 8 years; A. J. Moulder, 10 years; A. J. Bowie, 12 years; F. F. Low, 14 years; John B. Felton, 16 years.

One appointed and one elected member of the Board will go out of office every two years, until the first term of sixteen years has been fulfilled, when each of the two latter class, as they afterwards come into office, will serve for the full period of sixteen years. The full Board, as will be seen, comprises twenty-two members. It is to be hoped they will each and all enter upon their important duties with zeal and intelligence, to the end that the new University may start out with all the advantages which may be desirable for the liberal provision which has been made for its maintenance.

The Board of Regents met at the office of Haight & Temple yesterday forenoon. The newly-appointed members having been inducted into membership, the organization was completed. A committee was appointed to report on the location of the Agricultural College, and another to procure rooms for the business of the Board, and a third to report upon the distribution of business, the raising of standing committees, the rules and by-laws of the Board, and the order of transacting business at the meetings of the Regents.

MODERN PRACTICE OF PHOTOGRAPHY, BY R. W. THOMAS, F. C. S.—We have received from Henry Carey Baird, of Philadelphia, the publisher, a copy of this work. It is a neat volume of seventy-two pages. The author quotes, as a starter, Voltaire's saying, that "the fault of most books is that they are too long." The book contains six chapters, and will be found a valuable manual for all who have devoted themselves to this wonderful art of sun-painting. The price is seventy-five cents in currency, free of postage.

THE PAVILION.—The floor of the Mechanics' Fair Pavilion is laid, and workmen have commenced putting up the sides of the structure. It is the intention to have it so nearly completed on the 4th of July that the literary exercises for the day may be held there.

THE LABOR EXCHANGE still continues its operations in a most successful and praiseworthy manner. It should be cherished by our citizens and liberally supported from the public, as well as from private purses.

New Patents and Inventions.

Under this heading we shall mention, from week to week as occasion may demand New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

List of patents issued from the United States Patent Office for the Pacific Coast and Territories for the week ending May 19th, 1868:

IMPROVEMENT IN CULTIVATORS.—Henry A. Gaston, Stockton, Cal.

IMPROVED CONCENTRATOR.—Joshua Hendy, San Francisco, Cal.

IMPROVED MACHINE FOR POLISHING WOOD.—Henry O. Hooper, Diamond Springs, Cal.

IMPROVEMENT IN GANG FLOWS.—Geo. W. Manuel, San Francisco, Cal.

IMPROVEMENT IN TIRE TIGHTENER.—Silas Shirley, Santa Clara, Cal.

IMPROVED CHIMNEY CLEANER.—John J. Wait, Oreana, Nev.

PATENTS RECENTLY ISSUED.

77,868.—IMPROVED SHOE FOR AMALGAMATORS.—John H. Bullock, Gold Hill, Nev. I claim the combination and arrangement on the face of a shoe or grinder for amalgamators, of the grooves H, H, with the supplementary grooves I, I, by which the quicksilver is taken from different points at the outer edge of said shoe and delivered at different points in the rear of the same to be in the way of the following shoe, substantially as described.

The nature of this invention consists in so constructing the shoes of grinders and amalgamators, that the quicksilver which is used in the process, and which, from its density or specific gravity, would naturally be thrown to the periphery of the pan as it revolves, is caught on the toe or point of the shoes and carried to the center and back again through grooves made at different angles in the face of the shoes. The tendency of this shoe is to wear the bottom of the pan level, whereas the ordinary shoe wears the bottom off in ridges, in which condition of the pan good work cannot be done. Moreover, it is claimed that by the use of this shoe, one-sixth more pulp can be charged into the pan, than is ordinarily admissible,—and as a consequence from 15 to 20 per cent. more work can be done.

78,160.—IMPROVED LAMP-CHIMNEY CLEANER.—John J. Wait, Oreana, Nev.:

The combination of the cushion G, and the spring E, the thumb-piece F, at the lower end of the spring, and the slide D, operating on the guide-plate C, the whole constructed and made to operate substantially as and for the purposes herein described.

This invention consists in the construction of an apparatus for cleaning lamp-chimneys. It consists of a wooden handle, to which are attached a spring and cushion, connected with a guide and thumb-piece, by which the spring is expanded as desired, to press against the inner surface of the chimney. A hook is placed at the end, which may be made to hold a cloth which falls around the implement, and prevents it from being soiled in the operation of cleaning the chimney. The glass to be cleaned should be first dipped in warm water, and the implement thrust into the lower opening of the chimney. By placing the thumb on the thumb-piece, the cushion may be made to press against the entire length of the chimney, when by turning the cleaner around, the chimney will be thoroughly cleaned.

GRAIN SACKS.—The Pioneer Woolen Mills of this city will soon commence the manufacture of grain sacks from jute. The Oakland Cotton Factory has also purchased machinery for the same manufacture, and will have it in operation in season to supply sacks for the incoming crops. These bags will be furnished cheaper than those imported, and will save for the State over a million of dollars annually, which has heretofore gone abroad for our supply of that manufacture.

CONTINENTAL Life Insurance Company, 302 Montgomery street, corner of Pine.

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board.

SAN FRANCISCO, SATURDAY MORNING,
JUNE 13, 1868.

Financial.

There is probably no steadier and more unyielding money market in the Union than is found in San Francisco. Rates have not varied for a year or more. The fluctuations which have characterized the money markets of the Atlantic States have had no effect whatever upon ours. The quotations given in our former issue still remain in force. Money is obtained at 1 per cent. per month on call loans, and 10 to 12 per cent. per month for large sums on acceptable securities.

Bullion is in better supply and is quotable at the following rates: Gold bars, \$900.00, and silver bars from par to 1/4 per cent. premium. Currency bills on Atlantic cities, 3/4 to 3/8 per cent. premium on gold; sight drafts, payable in gold, 1/2 to 1 per cent.; telegraphic transfers, 1 to 1 1/4 per cent.; sterling exchange, 48 1/2 to 49; commercial exchange, 49 1/4; Mexican dollars, 4 1/2 to 5 per cent. premium; exchange on Paris, 5 francs for 30 days.

During the week a speculative movement in greenbacks occurred here, sending prices up 2 1/2 per cent. It was supposed by the operators that a scarcity of paper money existed in the market, and, in view of the fact that Government disbursements are unusually light at present, that the demand for purposes of Internal Revenue would completely drain the market. This view was fallacious, as there is more of this kind of currency held here than was expected, and prices have since receded.

The Branch Mint operations for May included 36,431 ounces of gold deposits, and 61,830 ounces of silver. The cofiage was \$660.00 in double eagles and \$54,000 in half dollars. The range for gold bars during May was \$800.00, mainly of the latter figure. In consequence of limited supplies. The amount of gold deposits in May, 1867, was 155,669 ounces, being 110,238 more than for the same month of the current year. This is attributed to the greater absorption of crude bullion by private refineries, and decreased production.

The seventeenth annual report of the Commissioners of the Funded Debt for the City and County of San Francisco has been published, and makes a favorable showing of our financial affairs. The amount of outstanding bonds, May 31st, 1867, was \$1,257,900. The amount redeemed during the past year, \$68,700; amount outstanding May 31st, 1868, \$1,189,200; interest to be provided for by the city, \$118,020. The financial operations of the Board during the year have made a net profit to the city of \$106,779. The Sinking Fund, on the 31st May, 1868, amounted to \$1,111,221, exclusive of \$68,513 due from the city on the requisition of 1866-67.

The shipments of Treasure from June 1st to date have been as follows:

June 3—Per Colorado—	
To China.....	\$535,478 41
To Japan.....	8,000 00
	\$543,478 41
June 5—Per Nebraska to New York.....	118,108 69
June 6—Per Constitution—	
To New York.....	\$274,785 43
To England.....	332,597 15
To Panama.....	15,000 00
	622,382 58
Total since June 1st, 1868.....	\$1,265,867 68
Previously this year.....	16,696,090 04
Total since January 1st, 1868.....	\$18,961,957 72
Corresponding period 1867.....	18,305,639 85

Decrease this year..... \$225,580 13

The duties paid at the Custom House in this city since June 4th, and previously this year, have been as follows:

June 5.....	\$27,583 38
June 6.....	5,542 21
June 8.....	24,841 28
June 9.....	20,005 38
June 10.....	44,389 27
June 11.....	12,648 86
Previously in June.....	91,573 45
Total in June.....	\$225,318 93
In May.....	674,532 43
In April.....	883,053 68
In March.....	159,792 87
In February.....	667,701 23
In January.....	593,238 36
Total since January 1st, 1868.....	\$3,601,638 48

City Stocks.

During the period under review, increased attention has been given to miscellaneous securities. No note sales of North Beach and Mission Railroad stock at \$62 1/2. This company disburses a dividend of 1/2 per cent. on the 15th inst. A considerable amount of Omnibus Railroad stock was sold at \$68 per share. This company also disburses its usual monthly dividend of 1/2 per cent. on the 15th inst. Spring Valley Water was in the market at \$68 to \$72 1/2, and California Steam Navigation Company at 70 per cent.

The Bank of California pays its usual monthly dividend of 1 per cent. (\$50,000) on Monday, the 15th inst. Early in the week, ten shares of Pacific Bank stock sold at 95 per cent. At a meeting of the stockholders of the San Francisco Insurance Company, held on the 8th inst., the proposition to disincorporate and wind up their business was carried by an affirmative vote of 2,555 shares out of the 3,000 representing the company.

The stockholders of the National Insurance Company held a special meeting yesterday afternoon to consider the question of disincorporation. The number of shares represented was 8,588, the total number being 10,000. The vote stood 8,168 in favor of disincorporation and 420 against such action. The company will, therefore, go into liquidation. The corporation will, however, remain in existence for one year from this date, and its capital will not be divided until after the expiration of every outstanding policy; but the assets of the company, amounting to over \$1,000,000 in gold coin, will remain as at present, primarily liable for all losses that may occur.

The offer of D. O. Mills, to surrender bonds of the civil funded debt of the State of California, issued since the 1st of January, 1855, was accepted by the Board of Examiners, at the rate of 97 1/2 cents. Twenty thousand dollars' worth of bonds were so surrendered.

Mining Share Market.

Early in the week the mining share market exhibited some improvement over the previous week, and a much better feeling was manifested among dealers. The dis-

position to invest was apparently on the increase, and the descriptions of stocks dealt in had taken a wide range, thereby increasing the aggregate sales for the week. However, at the close, the general list experienced a serious depression, and outsiders are less disposed to venture. In this connection we may state that the most pleasing feature of the market, is the increase of dividend paying companies, as well as the amounts disbursed by them. The advanced state of work in the various claims on the Comstock lode and the continued vigorous prosecution of the same, gives strong assurances of a better condition of the market, as we may reasonably look for promising developing before long. Increased attention is being bestowed upon California mines, some of which have lately been placed upon the market, and we understand others will soon follow. The productiveness of these mines is well attested by the recently published statistics. The region beyond the great Comstock belt is also attracting more than usual attention, and it is believed that the mining activity in Idaho will be immensely augmented during the present year. The not infrequent receipts of bullion at Virginia City by the overland stages from these sources is an indication of the substantial results we may expect as the summer months advance.

HALE & NONCONCISE—advanced from \$112 to \$120, declined to \$117, then sold at \$103, and closed at \$114. The bullion product in May amounted to \$69,766 86 from 2,592 tons of ore. A dispatch of the 11th inst., says they struck clay in the lower level, at a point about twenty-five feet east of east clay wall. On the 8th inst., the drift was in 190 feet. The tunnel toward the Chollar ground in the 930 level, twenty-five feet south of the main tunnel, encountered ore that will pay, but it is yet uncertain what the extent of the deposit may be. It is encouraging, however, to obtain ore at a point south of where the other body gave out.

CROWN POINT—has been tolerably active at \$109 to \$117, then selling at \$100 50, and closing at \$103, ex dividend. On the 10th inst., the shaft had attained a depth of 59 feet below the 800 level—running in hard ground, but on the following day the ground was more favorable. The drift on the 800 level was 150 feet from the line, showing four and a half feet of good pay ore in the face. On the 11th inst., they started a winze from the 800 level at a point thirty feet from the line. A dividend of \$7 50 per share is payable since the 12th inst. A dispatch of the 12th says the shaft is 64 feet in depth. In the south drift the vein had contracted somewhat, showing about 3 1/2 feet of very good ore. KENTUCK declined from \$430 to \$350, and at the close advanced to \$375. The actual bullion returns for May amounted to \$106,969 48 against \$110,616 77 in April. To date, for June account, bullion receipts aggregate \$18,069.

SAVAGE—advanced to \$163, declined to \$144, and closed at \$146 50. The statement for the week ending June 6th, shows the product of the mine to have been 1,768 tons, valued at \$47 24 per ton. This amount came from the following localities: third station, north mine, 396; fourth station, north, 206; fourth station, south, 1,061; fifth station, north, 19, and fifth station, south, 86 tons. 6,930 tons of ore were reduced in May, showing a bullion yield of \$229,760 49 against \$222,734 in April. A dividend of \$10 per share is payable since the 12th inst., leaving a surplus of \$95,000 after disbursing the same.

IMPERIAL—was in moderate request, selling within a range of \$200 to \$210, falling to \$185, and closing at \$192 50. The bullion receipts for May aggregate \$51,234 58 against \$53,579 in April. The drift on the 900 level is running in drift and porphyry, and they make about three feet per day. Expected to commence work in the vein on the night of the 11th. They continue to hoist about 100 tons of ore per day from the Alta and Holmes mines. On the 12th they had progressed two feet on the bottom of drift, running in quartz, the same being hard and barren. Little water to contend with. **EMPIRE** is quiet, selling at \$232 50 to \$225. The bullion obtained during the month of May amounted to \$17,926 90 against \$17,674 in April.

CHOLLAR POTOMI—sold at a considerable advance, rising to \$310, declining to \$285, dropping to \$260, and a closing at \$271. During the week ending June 5th, 714 tons of ore were extracted and 900 1/2 tons shipped to custom mills. It is stated that the Blue Wing stopes has changed for the better. The incline is now 253 feet in depth, and from the surface, perpendicular measurement, 1,115 1/2 feet. They expected to complete the so-called 1100-foot station the present week.

GOLD HILL QUARTZ—is in little request, selling at \$117 50 to \$95, and closing at \$105. A dividend of \$7 50 per share is payable on this stock since the 12th inst. **OVERMAN** rose from \$70 to \$77, then sold at \$69, and closed at \$67. In May the bullion receipts amounted to \$31,235 24 against \$37,000 in April.

NORTH STAR (Cal.)—This stock was called in the Board for the first time on the 6th inst., and sales were made at \$117 50 to \$112 50. This claim is located in Gracia Valley, and consists of 8,028 feet of ground. The capital stock of \$1,200,000 is divided into 3,000 shares of \$400 each. A twelve days' run, just received, aggregates \$14,800. A portion of this time a number of stamps were idle. A dividend of \$5 per share is payable on the 15th inst.

The sales in the Board during the past week have been as follows: Regular sessions, \$1,893,723; open sessions, \$558,165—total, \$2,451,888.

NEW INCORPORATIONS.—Articles of incorporation have been recently filed in the County Clerk's office in this city as follows: **LORETO GYPSUM CO.**—June 11th. Capital stock, \$40,000; 400 shares, \$100 each. Trustees: W. C. Hyde, H. R. Norton, W. S. Day, S. W. Howland and W. P. Prichard.

ELECTION OF OFFICERS.—**YOSEMITE CONSOLIDATED M. CO.**—June 9th. Trustees, R. L. Bampton, Peter Brandow, Robert Stuart, Wm. K. Squires; President, David Wilder; Secretary, R. L. Bampton; Treasurer, David Wilder; Superintendent, Peter Brandow.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

Amador County.

Ledger, June 6th: Messrs. Coney & Bigelow are now enlarging their chlorination works to double their present capacity. They will by this means be enabled to work their own sulphurets, and also all that may be offered. They have made a contract to work 200 tons for Mr. Morgan, of the Oneida mine.

Upper Rancheria is said to be now one of the best placer mining camps in the State, and a great deal of work is being done and new claims opened up.

Dispatch, same date: The B. B. Mining Co. are progressing with their claim finely. The level is now completed from the shaft along a fine bed of gravel to the extent of 40 ft. or more. The car is now ready to put in and it is thought that the rails will be laid this week. Mr. Tibbitts and S. S. Mannon prospected the gravel, and found of gold one to two bits to the pan.

Calaveras County.

Correspondence, May 23d: Railroad Flat Correspondence: The Petticoat mine, 13 miles from Mokelumne Hill, is in a splendidly timbered country and lumber is cheap. A site for the mill will be furnished by stripping and washing the gold-bearing gravel on the south of the main shaft. Hephurn & Co's mill is taking in quartz, but not just now crushing.

Mariposa County.

Gazette, June 5th: We learn that very rich rock has been struck in the Potts mine, Hunter's Valley. It is said to be richer in gold than ever before known. The rich strike is in the main lode, and was made during the past week.

Nevada County.

Transcript, June 4th: From a gentleman who came from Diamond Creek yesterday, we learn that the snow on the ridge is about eight ft. deep. The miners on the creek have commenced operations and the prospects are first rate.

The owners of the Norridgewalk mine have commenced pumping out the water from their shaft. They intend to thoroughly test the ledge before they stop work again.

Gazette, June 4th: The North Star mine at Grass Valley, has recently increased its capital stock to \$1,200,000, to be divided into 3,000 shares at \$400 each.

Same of 8th: The incline shaft in the Banner mine is now down to a depth of 470 ft., and levels are run at distances of 100 ft. apart, with the exception of the upper, which is 120 ft. from the surface. The third level, 320 ft. below the surface, has been run 480 ft. north from the incline. The work of sinking the incline and running the lower levels is carried on night and day, while workmen are engaged in stoping out the rock above. Forty-two miners are employed. The company have just put up a Varney rock-breaker, which was started in operation on Saturday, and works admirably. Mr. Tisdale informs us that the ore continues to pay very evenly, ranging perhaps from \$20 to \$25 a ton.

The owners of the second, north extension of the Banner mine are actively engaged in developing their claim. A double incline is now down 40 feet, some 15 feet deeper than the tunnel. The walls are smooth and well defined, and the ore is rapidly improving as they get below the surface disturbances.

Same of 9th: In the Eagle ledge the tunnel is now in 320 ft., all but the first 70 ft. having been through blasting rock. The rock in some places was so hard that they were not able to make more than 18 in. or two ft. a week. They are now very near the ledge.

At Washington, some of the claims have got started up and are doing well. The old Portuguese claim is being fitted up with new wheel and hoistways and will commence operations next week. The claim of D. Eshach & Co. runs day and night, employing 10 men, and taking out over \$120 per day. Bohannon, Grissel & Co. just below, are making fair wages, although they think that they have not struck the richest gravel as yet. On Brandy Flat, just below Washington, Brimskill & Co. are running through a good streak of dirt and think that it will pay well. Brown & Co's claim at Rocky Bar commences pumping out next week.

The Belle Oro tunnel is now in about 120 ft., and is supposed to be within 10 to 20 ft. of the ledge. The last 20 or 30 ft. has been in blasting rock, and the progress has of course been slow. The ore from near the surface prospects fairly. A sample of sul-

phurets, worked by the chlorination process, yielded at the rate of \$150 per ton.

The Daylight, five miles above Washington, is being worked. The rock looks well. Charley Maroin is patiently pulling along at his tunnel at Phelps' Hill.

Grass Valley Union, June 4th: The Dromedary mine is taking out good looking rock. A crushing just made, gives the handsome return of \$1,418, for 42 loads of rock.

The report that operations on the Allison Ranch mine are to be commenced, was without authority.

We saw yesterday a gold brick valued at \$5,100, the result of a crushing of 79 loads of rock from the Grant mine, near Forest Springs.

Letter from Moore's Flat: At the Birchville mine, near Graniteville, the contractors are driving away at the tunnel, of which they have 460 ft. completed, leaving about 140 ft. yet to finish. The rock is pretty hard. The last crushing, from the upper level, yielded \$40 per ton. The Mutual Co., better known as the Jim, commenced crushing this week, and their rock, as it is in the dump, looks well, and the copper plates at the mill indicate a fine clean up. This company will make a splendid season's work. A gentleman presented us with a specimen, which shows free gold plentifully sprinkled through it. From the Jim we went to the old California mill, which was hurned down some years ago. In former days this mine paid well, and it is probable that another mill will soon be at work. About 100 yards from the old mill is a reservoir filled with tailings, collected there during the lifetime of the old California, and this is held at a pretty high figure by the owner. The Manhattan ledge is six ft. in width, filled with sulphurets, and looks well in all respects. On the Southern Cross ledge, the owners are now at work and are in high spirits. The rock coming out shows well. Palmer & Everingham of Nevada City, are about to erect a custom mill on the South Fork of Poor Man's Creek, about half a mile from the Birchville. Sweet's ledge is soon to be worked again. Black & Young are running their mill only during the day time. Stacey & Banbury, just above Black & Young, have let a contract for a tunnel. May, Banks, & Co. are running a tunnel on the Ione. The Mulligan or "Golden Age," will soon start up. The rock of this pays \$15 per ton by mill process. Clark & Deho are at work on the Bald Mountain ledge. The Grizzly, at the head of Devil's Cañon, have machinery on the road, and will soon start their 10-stamp mill. They have been taking out rock all winter. Buck & Co., have named their discovery the Metropolitan. This claim is situated between Orleans and Moore's Flats, and shows free gold all through the rock.

Grass Valley National, June 4th: About ten days ago the pump on the Hope Gravel Co's mine was started up, since which time it has been going constantly day and night. The water has been reduced in the shaft about 50 ft., and it is thought the mine will be pumped dry within two weeks, when the company will commence taking out gravel. The shaft is now down about 216 feet.

The Empire Mining Co. of Grass Valley has increased its capital stock from \$100,000 to \$500,000.

Plumas County.

Quincy National, June 6th: At Black Hawk, Turner, Rice & Co., cleaned up this week, for 20 days' pipping on top gravel, 50 ounces. They will commence cleaning up bed rock in a short time, when high pay is expected. Madden & Co. are making good wages—from \$4 to \$6 per day. Other claims on the creek are doing well.

Poor Man's Creek Correspondence: Everything here is working smoothly. Bradley, Cain & Co. are opening a new claim on the South Fork. White, Gains & Co., are running night and day. Ex-Judge Beard is Superintendent of the Catville claims, and making money. T. A. Turner arrived yesterday from Nevada, and will resume work on his claim.

At Sawpit Flat, the miners have commenced washing their drift-dirt, which has accumulated during the winter months. Thus far, their pay has been good. The New York Co., for two days' washing, cleaned up 400 ounces, or over \$7,000. The Buckeye are taking out from 40 to 50 ozs. per week. The Union and Eagle companies will commence washing in a few days. They have a large lot of pay dirt in their dumps.

Placer County.

Stars and Stripes, June 4th: Colfax letter: The Rising Sun quartz mill was set in motion on Monday last with every prospect of success. Stock has been sold for \$20 per foot. Other ledges are being prospected with very flattering results.

Gold Run letter: This place is doing bet-

ter than for some time. The great tunnel project seems to get along rapidly. Every claim that had any intention of washing this season is in fine running order. (The Kinder & Stewart claim cleaned up last week and realized the sum of \$47,738.) Several other companies have cleaned up with similar results. The usual length of run here is from 18 to 20 days. The cement mill is still crushing its blue lead gravel with good results. Since the reduction of the price of water, several new claims have been opened.

Grass Valley National, June 8th: We are informed that a clean up was made of the rock from the Rising Sun, near Colfax, on Saturday last. After a run of six days, with a 5-stamp mill, \$6,000 was realized. The mine has been worked to the depth of 117 ft. and the ledge has every indication that it will continue to hold out. Where the company are now taking out rock the ledge is over three ft. thick.

Shasta County.

Courier, June 6th: The yield of the Washington mill, at French Gulch, for the month of May, amounted to \$6,752.45. The run was not made on the best quality of rock.

Piety Hill letter: McPherson & Co. have cleaned up, and the result, I understand, is quite satisfactory, the amount being several thousand dollars.

The quicksilver mine on South Fork is undoubtedly very rich, but it will require means to develop it.

Sierra County.

Downieville Messenger, June 6th: We understand that Gray & Co., of the Gold Valley Quartz Mill, have commenced work for the summer. Their rock is very rich, but peculiarly intractable, though the owners believe they have got the advantage of it now.

We paid the Galloway diggings a visit a few days since, and found three companies working, and were not a little surprised to find that the tunnels are located near the summit of the range. It does not seem possible that pay dirt of such richness could be found so near the summit, on such rolling surface. We believe the prospects of all the companies are flattering, and ere long a larger force of men will be required.

At Port Wine, the mines are understood to be paying better of late, and times look more promising.

Siskiyou County.

Yreka Union, June 6th: Last week the claim of John Lessard & Co. of Humboldt, yielded \$700; the claim of Romine & Co., \$500, and the claim of Harry Pickman & Co. about \$500. All who are washing up on this stream are doing well.

Lash & Co., of Humboldt, have started their quartz mill and are crushing, at present, quartz taken from the Eliza ledge. The ledge is from four to six feet in thickness.

Tulume County.

Sonora Democrat, June 6th: Mr. Snow, of the Cosmopolite mine, took out nearly \$500 in free gold last week, of which one piece weighed \$50. This is independent of the gold taken from the rock crushed at the mill.

Yuba County.

Marysville Appeal, June 7th: We learn that the Rattlesnake and Pennsylvania mines are crushing gold rock—the former first-rate and the latter rate the first.

BRITISH COLUMBIA.

A dispatch from Victoria dated June 7th, is as follows: A party of miners started for Takon, 150 miles north, to prospect for gold. The Indians report that rich diggings are found in that neighborhood.

COLORADO.

Denver News, May 20th: Letter from Jamestown: The ore from the American lode yields in an arastra \$100 to \$120 per cord in gold, at an expense of \$50. Its weight is about 4 tons to the cord. The Potosi has a crevice averaging 5 ft. Two shafts, respectively 90 and 120 ft., have been sunk, and a level connects them at a depth of 30 ft.

Letter from Ward District: The average yield of the ore from the Ni-Wot Co's mine, as produced in their 50-stamp mill, is \$7 to \$10 per ton, treated at an expense not exceeding \$5 per ton. The average of all assays has been \$35 per ton, and 25 to 33 per cent. copper with a trace of silver. The company are working their mill to its full capacity. Fifty tons is the amount of ore treated daily—working night and day. During the past winter the average was only 25 tons.

Letter from Granite District: Work in the Yankee Blade has been suspended for a short time. Messrs. Hayden & Royce will be ready to run by the first of July. Altogether the prospects of Granite Dis-

trict are very good for the coming season. At Cash creek there is a good head of water.

Central City Herald, May 20th: The old Eagle mill has been regenerated, and has now 20 stamps running on ore from the Bates lode. Barrett & Co. have their engine on the Winnebago lode, in position and running. Sanderson & Co. have reached a depth of 120 feet on the discovery of the Bates or Hunter lode, and have erected a whim. At the present depth the crevice gives a showing of a two feet vein, solid ore. An assay of Equator ore, made the other day, gave 3,950 ozs. per ton.

Clear Creek correspondence, dated Idaho, May 16: Gulch mining for the season has started. Every one is pitching in, or preparing to do so at once. Some very good claims have been opened up and very rich pay has been struck, but there is unfortunately great lack of capital among individual miners. On Chicago Creek several rich claims have been opened; from one owned by a party of Frenchmen and a veteran gulcher, named Silvertooth, an average of 23 ozs. a week has been taken out. In the last week in April 13½ ozs. were sluiced in three days, and it now pays steady at the rate of \$15 per day to the hand. W. L. Campbell & Co. start in next week at the upper end of the Illinois Bar. Lowe & Fitzpatrick are working with a large derrick, and will soon reach bed rock. Further down Dick Skinner and Esus Kris, a Norwegian, have been sinking a shaft, and were proceeding to crib it from the bottom when the whole thing caved in. They are determined to go to the bed rock and drift. It gives good prospect. Some of the colored folks have been sinking at the lower end of Grass Valley Bar, and have a prospect of rich pay. John Hardy and others have reached the bed rock, but have not struck rich pay yet; on Friday it showed from two to three cents to the pan.

While at Clear Creek the other day, we took a pan of dirt from the claim of Wright, Clearfield & Co. from which we obtained one dollar in gold. The paystreak is wide, and the bed rock a little over six feet from the surface. The company cleaned up 13 ozs. from 4½ days' sluicing. Many other companies have struck rich pay. One company of men averaged \$60 each for last week's work, another took out 8 ozs.

Register, May 21st: The Consolidated ditch is uncompleted. The Mendell mill, a 12-stamper, is crushing surface ore from the Greenlee lode, Eureka cañon. The quartz and dirt yield about 4 ozs. per cord. Tascher & Co. expect to commence crushing from the Great Republic, on Quartz Hill in the course of the week. The Kimber mill is crushing ore from the Clark-Gardener property. The yield ranges from 5 to 8 ozs. per cord. This mill has not been idle in twelve months. Mr. Stevens has an arastra in Eureka, which yield about \$160 per week, from surface ores mined in company from the Grey Eagle. Fred. Conant is running the Holman mill on Bates ore. He is taking out fine ore from the Adaline.

John B. & Wm. Church, of Chicago, are developing a series of veins in Elkhorn Gulch. Several shafts are down, and the prospects are highly encouraging.

Letter from Sugar Loaf: Jas. S. Wilson, on Four-Mile Creek, has run an adit 220 ft. He will soon test his ore in arastras. The frame of the mill for Wright, Crosby & Co. to reduce Hoosier ore, is already up. Parties washing in the creek near here are getting good pay.

An assay of Maria ore, Enterprise District, lately gave, at the Territorial assay office, \$1,423 silver, and \$62 gold, per ton.

Georgetown Miner, May 7th: Work on the Huakadora lode has been suspended for the present. Allen Lewis and Wm. Cooper are developing a good looking vein on Silver Mountain. Work on the Equator lode has been resumed, and some very rich ore is being raised. We understand that they are raising from the Magnet lode, half a ton of first class ore daily. The Lily lode is yielding some very rich galena and sulphuret ore, carrying some ruhy silver. We saw, on Monday evening last, a button of silver weighing within a few grains of six ounces, from about three pounds of ore from the C. J. Goss lode.

Active operations have been commenced on the Herkimer lode. The adit is now in 36 ft. The Alex. Hamilton is in 50 ft., with a 10-foot crevice. On Brown Mountain, the Terrible lode tunnel progresses slowly. Work at the Brown lode is going on well.

At Mott City mining affairs are improving. Mr. Snyder has two arastras at work on quartz from the Allro lode; 200 tons of quartz is now ready for treatment. Wm. Brown, agent for the Lincoln Co., will start up four arastras immediately. The tunnel is in 250 ft. The Boston & Chicago

Co. have suspended operations for the present. . . . Reed's mill is rapidly approaching completion.

DACOTAH.

Sweetwater Mines, South Pass City, May 19th: On the Buckeye ledge, near Atlantic City, a cross cut has been run, disclosing the width of the vein to be 20 ft. The rock shows free gold in abundance.

Temple & Co's placer claim in Beaver Gulch bids fair to turn out well. We were shown a little over \$32 of fine dust, the proceeds of ten hours' washing by three hands last week.

Fairfield, Bronson and Marshall have commenced the erection of a first-class astrak on Willow Creek, to be run by water power, and intend to have it finished in 20 days.

Territorial Enterprise, June 4th: We have received a long letter from Mr. W. Dooley, now in the Sweetwater mines, dated South Pass City, May 20th: The writer is quite favorably impressed with the appearance of the country. The Cereso Co. cleaned up last Friday, after a run of a few days, \$40 to the man. The Cereso is the best gulch that has as yet been found, though there are others that will pay for working. Several ravines which afford water the year round will pay from \$4 to \$5 per day. "Swairengen, an experienced prospector, has just arrived from Oregon Gulch, 16 miles north, and reports from five to six cents to the pan. Col. Tozer has commenced the survey of a ditch and within two months will be able to furnish all the water they want." He says the quartz lead are as good as he has ever seen, so far as prospected. The deepest shaft in the country (Miser's Delight) is but 35 ft. deep.

The Silver Bend Reporter gives part of a letter dated South Pass, May 7th, from Ned Leitz. "A party started to-day for a place 15 miles distant which report says abounds in placer diggings that will pay from \$6 to \$15 per day; but I don't believe there are any mines in the region that will yield \$5 per day. There are some quartz ledges here that look well, but it will take a couple of years to prove them. I think the country can be bought out cheap next fall."

IDAHO.

Lewiston Journal, May 23d: Warren's is filling up fast with miners, and things generally begin to assume a cheerful business-like appearance. Quite a number of persons were on their way there, and several trains.

The miners at Pierce City are reported busily at work. A large new ditch is to be brought in.

Idaho City World, May 30th: The latest from Deadwood Basin is that water is plenty, and the miners are all busy at work. The claims generally pay richly—some big.

The Dutch Co. say instead of their making \$25 per day, as published in this paper, they have been and are still making an average of \$100 per day.

Only one sale has taken place in the Basin. The one-fourth share of 1,200 ft. in Dutch Gulch sold a few days ago for \$1,000.

MONTANA.

Helena Post, May 22d: The mill at Sterling, belonging to the N. Y. & M. M. & D. Co., is running with success upon rock from one of Mr. Melby's ledges. Mr. M. says the rock yields an average of \$40 to the ton, and that he crushes about fifteen tons per day. No other mills are running and no ledges are being developed.

The supply of water in Alder is increasing, and nearly all miners having claims in the gulch have commenced work once more. The water it is thought will hold out until July, and perhaps a little longer. The Virginia water ditch is still empty.

Mr. Everett, who purchased the Green Campbell lode for a Cleveland company, is on his way to the Territory with a mill to erect on the property. During the winter he has had men at work who now have out some 3,000 tons of quartz.

The survey of the proposed ditch to bring water from the Madison, will probably be completed next week.

J. W. Hyde's Canadian Gulch Company cleaned up as the result of one week's run, \$600. The company has scarcely got well at work yet.

We learn from a private source that the Midas Mining Company has failed, and that the mill and property at Sterling are being disposed of. The liabilities are reported to be heavy, both here and in the States.

The miners have "struck it" to the tune of one dollar to the pan, on bed rock in the third or lower drain at Lincoln's Gulch. In the second drain, which is now being run five feet down in bed rock, \$500 was cleaned up recently by five men in twenty-four hours' run.

One of the most extensive ditches in the Territory is now being constructed in Deer

Lodge County, furnishing water to the Pioneer, Piko's Peak and Kyle's gulch mines, and will bring 3,000 inches of water from Rock Creek. Its estimated cost is \$60,000, and it is proposed to have it completed by the first of June.

There are some 400 men employed in and about Reynolds City, many doing well. Prominent among the mining operations are those being prosecuted by means of bed rock dunes, eight or nine of which are in operation in Elk Creek, and some of which are paying enormously.

The Cole-Sounders Mining Co. formed last winter in St. Louis for quartz mining in this Territory, have a mill on the way which will arrive here within 30 days.

Virginia items: Work is still steadily progressing on the Park lode at Highland. A shaft seven by eight feet has been sunk on Discovery claim to the depth of 50 feet, and a drift run across the ledge from the bottom, proving the crevice to be over 30 feet. The rock prospects well. . . . The owners of the Ballarat lode are running a tunnel to tap the ledge and are already in 300 feet. . . . The quartz mill of Hendry & Co. in Rochester Gulch, will be in running order in a few weeks.

From the *Democrat* we learn that the Virginia Water Ditch Company have set men at work on a ditch to bring water from the lakes near Summit into their flumes.

The *Independent* says that a train of 20 wagons had passed through Deer Lodge with the new mill for the Thomas lode at Cable. . . . The prospectors at Phillipsburg are devoting their attention to the discovery of gold ledges, believing that they can be made more immediately profitable than silver lodes, from the fact that there is but little machinery in the country for working the letter.

NEVADA.

Esmeralda.

Aurora Union, May 30th: Pine Grove items: Thos. Price has purchased a portion of the Mt. View ledge and has gone to work taking out ore which, though a low grade, is abundant. The Pioneer mill starts up on this ore on Monday next, and if it comes up to expectations the mine will keep the mill constantly employed. . . . The new mill of Toombs & Abrahams was started up on Wednesday evening last, and works admirably. The machinery and building are arranged with an eye to convenience. They have near 500 tons of ore on the dump calculated to yield \$60 per ton. . . . Mr. Bourn, the Supt. of the Midas mine, designs prospecting on the lower level, and if a sufficient body of sulphuret ore can be found, the company will proceed immediately to the erection of a mill. . . . The Wheeler mine is yet lying idle, but the probabilities are that some disposition will be made of it before long. . . . There are quite a number of claims being prospected in and near the Grove.

Humboldt.

Register, June 6th: Mr. Smith has resumed work on the Alpha mine. He has out a large quantity of good ore, and after some 60 days of further prospecting, will commence the erection of a 10-stamp mill. This will be placed in Echo Cañon, and will be conveniently situated in regard to the mine.

Dr. Fred. Hutchins has a ledge eight feet wide that will pay \$30 per ton in silver from wall to wall. His mine is situated on the west slope of the East Range, near the valley, and about 22 miles from Unionville. It is admirably situated for wood, water and easy approach. He, in company with John Twiss, have been industriously at work sinking a shaft on the ledge for some time.

Reese River.

Silver Bend Reporter, May 30th: County Surveyor Tagliabue brings intelligence of the discovery of rich gold bearing ledges in Mammoth district, which at present absorb the attention of the entire population of that section. Mr. Tagliabue brought some exceedingly rich specimens of gold-bearing quartz. The lodes are situated about three miles due west of the town. They are of good size, and all show gold in abundance. The specimens shown us were very rich in gold.

Last week Mr. John H. Boalt, Chris. Bauer, and others, spent several days in examining the mining property of the Ophir Co. in Manhattan district. They all express favorable opinions of its worth. It is very probable that the company will commence operations there this fall. A small lot of the ore from the Ophir, amounting to 2,500 lbs., was recently sent to Austin for reduction, and yielded at the rate of \$232.54 of silver per ton.

Cammack is now overhauling and placing in complete order the Pioneer mill at Lone, and it will soon be set at work under the direction of competent managers.

In Hot Creek district, Gillett & Clark have reached a depth upon the Wyoming,

near the mouth of Rattlesnake Cañon, of about 40 ft. and are working night and day. They now have over 100 tons of good milling ore ready for reduction. About one mile north of Rattlesnake Cañon the Silver Mountain Co. is sinking upon the Hector lode, which exhibits rich ore, and the prospects are exceedingly favorable. The small 10-stamp mill in Hot Creek Cañon will probably be running within 10 days, and a telegram has been received from the East stating that the Old Dominion Co. would soon rebuild their mill.

From Palmetto district we have the most encouraging reports. Upon the Silver Champion lode two inclines have been sunk to the depth of about 310 ft. each. These shafts are 110 ft. apart, and will be connected by levels. Upon the Kentucky claim a force of workmen is constantly engaged. . . . A 12-stamp mill is in course of erection by the New York & Silver Peak Co. The machinery is already upon the ground; and it will be in operation by the 1st of August.

T. F. White, Supt. of the Northumberland Co., has purchased the 10-stamp mill at Indian Springs, San Antonio district, known formerly as Hunt's mill, and is now tearing it down for the purpose of removal and reerection at Northumberland.

Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

Territorial Enterprise, June 3d: Workmen are engaged in cutting down the big chimney at the Gould & Curry mill. The chimney is 150 feet high, about 8 ft. by 10 at the base, and 4 ft. square at the top. It contains 180,000 bricks.

Same of 4th: A quantity of ore is now being taken out at the Sutor mine, situated on the Comstock range on the north side of Cedar Hill, for test by mill process. It will be worked at the Ogden mill. The deposit is found to grow both wider and richer as it is followed down.

5th: The Alpha Co. are thoroughly overhauling all the machinery about their hoisting works, and will be ready to resume operations in a couple of weeks. The Imperial-Empire shaft has drained all the water from the underground works.

The Empire and Imperial Cos. are at last fairly at work in their drifts and have made some progress in the vein, finding good ore in small streaks. All the indications of shortly coming upon large and valuable deposits of ore are considered to be good.

6th: A large deposit of excellent ore has lately been struck in the Rogers mine, Flowery District. The ore is the richest ever found in the mine, and assays as high as \$1,500 per ton, but is somewhat intractable.

The United States Co. are now down 70 feet with their large shaft. The rock continues soft and much mixed with clay and streaks of quartz. It is being substantially timbered as the work progresses.

The receipts of the Crown Point Co. for May were \$168,000; expenditures, 77,000.

The annual report of the Bacon M. & M. Co., shows that from June 1, 1867, to May 15, 1868, there was mined and delivered to the mills 12,123 tons of ore, yielding \$262,034 in bullion, and showing an average per ton of \$21.61½. This ore was principally top-rock. The amount of ore on hand May 15, was 5,563 tons—1,000 at the dump, and 4,563 tons at the Pinte mill.

Trespass, June 6th: In the Ophir, the shaft is down 239 ft. in easier ground, and more water. . . . In Crown Point, the shaft is now down 55 ft. toward another station, in ground of easy quality to sink in, although not as good as was encountered last week.

The south drift, 800 ft. station, is now in 126 ft. developing the east body, and showing excellent ore. The upper portions of the mine are looking as well as usual. About 4 tons of ore, which will mill in the vicinity of \$40, are being extracted daily. The net profits for May were \$87,000, and the usual dividend will be declared. . . . In the Chollar-Potosi about 100 tons of ore are extracted daily, nearly all of which is taken from the Blue Wing station, which pays the expenses attendant upon prospecting, etc. From the old cave ground considerable good ore is being extracted. The timbers for the 1,100 feet station are being placed, and a drift will be started early next week. . . . In Empire mill the west drift from the new shaft has been in barren quartz, but within two or three days has developed spots of fine ore. Last evening a new vein of quartz and ore was developed. . . . In the Gould & Curry the Bonner shaft is being sunk as rapidly as possible. Last night it was 964 ft. in depth, about 1½ feet per day being accomplished. Considerable water is encountered, and all four pumps are in constant operation. Next week about 50 tons of ore daily will be taken from the old mine.

The tailing mill belonging to the company is at work on the slum from the old reservoirs. . . . In Halo & Norcross the face of the drift at the lowest working station is now supposed to be about 43 ft. from the ledge. At the lowest station, where the cave occurred, but little progress has been made. . . . In Imperial the machinery at the new shaft works well, and for seven days bailing and hoisting has been uninterrupted. . . . In the Occidental a contract for running a drift and sinking a shaft has been advertised. The mine at the second station has been yielding good ore. The first level—old incline—remains unchanged. . . . In Kentuck the working levels are looking as well as usual, and are yielding excellent ore. The shaft is in easy ground and being rapidly sunk towards a new level. . . . In Savage the upper stations of the mine are yielding as well as usual. Between the 4th and 5th stations the ore has improved unexpectedly, and is widening as raised on. At this point there has been extracted considerable first-class ore. At the 5th station, the face of the drift north does not show any ore. The 6th station has been opened, and a drift is being pushed westward. . . . In Yellow Jacket the 750 ft. level of the mine exhibits marked improvement. It is said that a drift east of north from the 810 ft. level has been commenced, and is now in about 27 ft.

The following is the statement of the amount of bullion dispatched during the past week: From the office of Wells, Fargo & Co., in this city, 6,979 lbs. of assayed bullion, valued at \$239,661.98; from Gold Hill, 2,293 lbs., valued at \$77,389.84.

NEW MEXICO.

Santa Fe New Mexican, May 19th: Parties from the Pecos state that some miners prospecting that river and tributaries have taken out considerable gold.

By private advices from Rio Arriba County we learn that some valuable gold, silver and copper leads have been taken up under the auspices of Gen. Heath, who visited that section.

Elizabethtown letter: That gold exists here in paying quantities over a large area, cannot be doubted. One company sold last evening gold dust to the amount of \$850, and during the past week over \$2,500 in gold dust have been sold. Work has been commenced in earnest on the ditch from Red River.

OREGON.

Jacksonville Reville, May 30th: Milling for the Timber Gulch ledge was suspended for a time last Monday, after a run of 206 tons; it having been ascertained that the quartz could be worked more profitably by assorting it. Meanwhile the mill has been kept running on rock from other ledges. Three tons from Ives' mine in Sterling yielded \$50 per ton. Twenty tons from the Rising Star, yielded \$9 per ton. This ledge is on the South Fork of Jackson Creek, three miles from town. We understand that work will be resumed at once. The mill is now at work on ore from the Blue ledge above Kanaka Flat.

Messrs. Brown, Parsons and Brooks are reopening the old mine on Richardson ledge with the view of testing it by mill process. Neuber and Boushey will soon commence prospecting in the Bauer ledge. The Howard and Payne ledge on Brush Creek, is now open, but means are wanting to enable the owners to give it a practical test.

WASHINGTON.

Olympia Transcript: From a gentleman from Chehalis Point, we learn that one company, at least, is making money mining. Five men worked five days and cleaned up a little more than \$100, at \$16 per ounce of dust. At this rate the men made nearly five dollars per day to the man. They work with sluices, raising the water with a hydraulic.

AN AIR LINE.—The American Central Railway, a projected air line road from New York to Omaha, has, we learn, finally assumed a definite shape, and the enterprise is to be pushed through as fast as money in abundance can do it. The entire airline will be made by a consolidation of the Allentown road to Harrisburgh, the Pennsylvania Central to Pittsburgh, the Fort Wayne and Chicago to Fort Wayne, and the American Central to Omaha. The company was fully organized at Fort Wayne, Indiana, on the 5th inst., and the road will be one of the most important now building in the United States. Its length is to be five hundred and eighty-five miles, and by its directness will shorten the route now traversed between this city and Omaha by one hundred and thirty-six miles. When the Pacific railway is completed this new road will constitute with it a grand trunk line from ocean to ocean.—*Scientific American*, May 9.

Notices to Correspondents.

TRACKS.—The term tramway, as applied to railways, originated in the circumstance that the first iron rails laid down for the purpose of facilitating locomotion, were designed and constructed under the superintendence of a person named Outram—hence the term tram-roads from the employment of the abbreviated name of the originator, by using only the last syllable of the name. These roads were first constructed in Derbyshire, England. The original tram-roads were constructed very differently from those now used. The track on which the locomotive wheels moved was a flat piece of iron about three inches wide, with an inner flange about two inches high. A transverse section would form something like that of the Roman letter L, when laid on its longer side thus, L; a transverse section of the road would appear as follows: L..... The form of rail now in use was first adopted at the Manchester and Liverpool Railroad, 31 miles in length, at the suggestion of the late Geo. Stephenson, the chief engineer; which road was formally opened for traffic in the month of September, 1830. A locomotive, the Northumberland, headed the inaugural procession, drawing a large car and train of carriages. In the car was the late Duke of Wellington and other celebrities; among others, the late William Huskisson, a celebrated financial legislator, and at the time one of the parliamentary representatives of Liverpool. This gentleman unfortunately lost his life through an accident, which occurred to him on this occasion, in consequence of his accidentally coming into collision with the "Rocket," a locomotive that a few months previous had obtained the prize of \$2,500 for the locomotive that would draw a certain weight at the rate of ten miles per hour on the said railway. The accident occurred about midway between the termini, at a watering station, during a stoppage made for the purpose of affording an opportunity to the invited to inspect some particular features of this part of the line.

ORO FINE.—In a small way, such as estimating by the grain, the value of fine or pure gold cannot be approximated more closely, without going into very minute fractions, than by estimating the value of a grain of pure gold at four cents per grain, which would be equivalent to \$19.20 per oz. troy. Pure gold, however, in San Francisco, is worth more than \$20 per oz., and in Europe is worth \$21 per oz., varying occasionally from 25 to 50 cents above or below this sum. It is more profitable to remit unrefined than refined gold bars.

TYRO.—The three most useful fluxes for blow-pipe analyses are, the triple phosphate of soda and ammonia, carbonate of ammonia, and borax.

Canvassing Agents wanted at this office.

The New Mineral—Mariposite.

Mr. Orlando Jennings sends us, from Al-leghany, Sierra County, an interesting mineral specimen, which, he writes, is found in almost all the quartz lodes in that part of Sierra County, generally forming a strata along the hanging wall near the white quartz, and at times taking the place of it. Our correspondent wishes to know something of the nature of the mineral, especially of the colored (greenish) portion of it. The answer to the query comes properly under the head of our usual notices to correspondents; but its unusual interest induces us to make fuller mention of it as follows:

The green-spotted mineral does not, as truly stated by you, contain the slightest trace of copper; yet the best and most experienced mineralogists and metallurgists have been deceived by its appearance. It is found in the vicinity of the "mother vein," and not unfrequently in considerable quantities, especially when in contiguity to magnesian rocks. We have a specimen in our possession which came from Lower California, several tons of which were once sent to this city for copper. This mineral probably occurs at other places than those enumerated, as well as in your vicinity. The origin of this curious mineral is at present unexplained by the most scientific; in fact, all to whom we have shown the specimen which you sent us, and who were supposed to be likely to be acquainted with the mineral, state that they never saw anything similar in any other part of the world than on this coast, and then only in localities similar to that which we have described.

Some who have been much accustomed to assaying minerals, in such districts, state that that or a similar mineral, sometimes forms and is found in their slags, occasionally in quite large buttons, but more frequently presenting the appearance of dispersed, small turquois.

The first person who has correctly described the subject, is Professor Silliman, who, in a communication to the California Academy of Sciences, in December last, gave the mineral the provisional name of *Mariposite*. The Professor says:

We find at Mariposa, in the Josephine and Pine Tree Mines, at Peñon Blanco, Maxwell Creek, Blue Gulch, Quartz Mountain, Silver's, Whiskey Hill, Rawhide, Chapavele Hill, Carson Hill, Angels, and Placerville—at all which places I have examined the mother lode with more or less care—a peculiar light apple-green mineral, occurring in scales, associated with iron pyrites in small and brilliant pentagonal dodecahedrons and implanted in a gangue of dolomite mingled with quartz. The dolomite is of the variety known as ankerite, and by its decomposition, which seems hastened by the oxidation of the associated pyrites, gives origin to those highly characteristic masses of brown and reddish-yellow iron gossan which form the characteristic feature of the outcroppings of those portions of the mother vein just enumerated. These gossans always retain the bright green mineral before alluded to unchanged, as also cellular quartz which discloses in its rhombic cavities the form of the decomposed crystals of dolomite or ankerite whose removal has left the vacant spaces. Before decomposition, this triple carbonate of lime, magnesia and iron is brilliantly white, and its real chemical character would never be suspected.

The green mineral, so far as I can ascertain, has never been described, although it has often been noticed. It has been called by some *nickel gymnite*, and I have once distinguished it by this name in a mining report. But this is a misnomer which I take this occasion to correct; nickel gymnite of Gent, found at Texas, Penn., is a hydrous silicate of magnesia, lime and nickel. The species so characteristic of certain portions of the mother vein is anhydrous, and contains no nickel.

Mariposite (Provisional Name).—Before the blowpipe it yields evidence of the presence of the protoxides of iron, lime, magnesia and potassium; of the sesquioxides of chromium and aluminum with carbonic, silicic, and sulphuric acids. The oxide of manganese and sulphuric acid exist only as traces. The mineral is probably

new, and must be referred to the mica section of an hydrous silicate. Should it, on a careful chemical examination, prove to be new, I would suggest the name *Mariposite* as an appropriate name for it, as it was on the Mariposa estate that it first attracted my attention, and where it exists in great abundance.

This species, which is so characteristic of the mother vein, in connection with magnesian or chloritic rocks, occurs nowhere so far as I have observed in this vein, when it is inclosed in argillites or syenites.

Pacific Mail Steamship Company.

It is a good will that speaks well of "the bridge that takes you safe over." Having recently made a voyage from New York on the magnificent steamers of the above named line, we are constrained to say in truth and justice, we believe there is no steamship company in the world who practice stricter rules for the health, security, and regular dispatch of their passengers, than the P. M. S. S. Co.

Persons who have not made the passage by this line within the past few years, have no adequate idea of the great improvements introduced in the construction and management of the steamers, and the additional fare and comforts provided.

We left New York May 16th, on the Ocean Queen. Although considered comparatively a "slow coach," she proved to be a remarkably steady, smooth-running boat, making for her best daily run, as reported, 291 miles. Capt. King seemed "all officer," giving constant attention to duty. Shackelford, first officer, is a vigilant mate. Mr. Mitchell, purser, is one of the oldest, and we should say, best on the route.

Capt. Lapidge, of the Golden City, "on this side" of the Isthmus, is a youthful-looking, vigilant officer. Although small of stature, he is of long and high standing in the line. He is a well-esteemed citizen of San Francisco, and takes "no stimulants aboard." The absence of "brandy-smashing," is one of the noticeable improvements among the officers of the line. Mr. Knight, purser, evidently a capable, fair-minded man, reads the "Episcopal service" on Sunday with becoming grace. With the chief stewards and other officers of the ships, we have no fault to find from our experience.

Great satisfaction is realized during the passage by this line, from the knowledge that the company insures its own vessels and freight; that the most experienced officers are employed; that the ships are thoroughly constructed for the trade and kept in good order; and the affairs of the company managed—from long experience—with wholesome regularity and prudence.

THE MINING COMMISSIONER.—R. W. Raymond, Esq., Mining Commissioner for the Pacific States, left this city on Thursday last for the interior. He will pass north, through Tuolumne, Calaveras, Amador and El Dorado counties. From thence he will go to Grass Valley, where he will arrive during the latter part of June. He will afterwards visit Virginia and Eastern Nevada, returning via Humboldt County to Idaho.

Mr. Raymond took occasion, in his address before the Academy of Sciences, to explain that he did not intend to go everywhere, and could not expect to "do justice" to the different districts. His attention being directed this summer to certain points, he will choose his routes and pauses with reference to the particular matters he desires to investigate, and not with reference to the relative productiveness or prospective value of different districts.

HAYES' HOOK AND LADDER TRUCK was exhibited on Thursday evening in front of the City Hall. This is a most useful invention, and should find a place in every city in the Union. Another and more public exhibition will be made of it in a few days.

More Petroleum Experiments.

By successive steps we appear to be gradually bringing to a successful issue the problems for burning petroleum for steam fuel. The apparent absolute necessity of a more condensed fuel for our ocean steamers, as well as the desirability of a more economic generation of steam for all purposes, draws a large share of the inventive genius of the country towards the utilization, in that direction, of the heavy coal oils which are found in such great abundance in various parts of the land. We have from time to time noted the progress which has been made in this direction, and shall continue to record similar experiments as they may come to our notice.

The failure of the late trials of the Foote apparatus, on the *Amelia*, have in no wise discouraged either our inventors or capitalists. There are imperfections in the device there employed, which have thus far proved insurmountable. The interest appears to have now passed from that to the plan patented by Col. White, of this city, to which we have frequently referred, and on which the Colonel has been almost constantly employed for many months. He has now brought his invention to such perfection as to look very much like positive success; as it has been in constant use for nearly two weeks, making all the steam employed in driving the machinery of the *Ætna Foundry* on Fremont street, requiring less attention than coal, and apparently involving less expense. In this latter particular, a careful record is being kept so as to determine accurately the comparative value of fuel consumed, as between oil and coal. The great trouble of the accumulation of carbon in the retorts and burners appears to have been entirely obviated.

Still another party, whose name we are not yet allowed to use, has been some time experimenting on the English plan of "atomizing" the oil, or injecting it into the furnace in the form of an exceedingly fine spray. This is accomplished by means of a steam jet, something on the plan of Giffard's injector. In the use of this method all trouble arising from the accumulation of free carbon is absolutely avoided; the only question being the perfect and economic combustion of the oil. We understand that experiments in the use of this principle, with the apparatus invented in this city, have been thus far so successful as to secure the utmost confidence in its success on the part of quite a number of our best mechanics and engineers, and that all the funds necessary for its fullest practical trial have been freely proffered. It will soon be tried on a large scale, upon both a marine and land engine. A public exhibition of its working will be given in a few days, when experts will have an opportunity to compare this mode of burning petroleum with that of its conversion into gases, as required by the devices of Cole, Foote and White. A patent for the spray burner has been applied for through the MINING AND SCIENTIFIC PRESS PATENT AGENCY.

CONVENIENT FOR STOCK-BROKERS.—The New York brokers are adopting an ingenious telegraphing apparatus, which keeps each one constantly posted in the prices of stocks without the necessity of leaving his office. The instrument may be placed in each stock-broker's office, requires no operator, and yet sends out a printed slip in each office simultaneously with a slip of like character in all the others with which the telegraph line may be connected. Any changes in prices which may occur in the Stock Board, are thereby instantly made known.

We are indebted to S. P. Sanders, artist, for a photograph of the new Court-House of Santa Clara County, at San José. The building is of stone and brick, and evidently the best court-house in the State. Its architectural design, by Mr. Goodrich, of San José, is superior.

CENTRAL PACIFIC RAILROAD.—President Stanford is now in Salt Lake City, with full power to do everything possible and proper in the city of the Saints to hurry up the work on that end of the route. It is the determination of this company to reach Salt Lake before the Union Central, if possible; and no mortal energy will be spared to accomplish that purpose, which is fully as important to the people of California, generally, as it is to the stockholders of the road. The policy of the Union Central in securing the labor element at Salt Lake to hurry up the work at its eastern terminus, will doubtless be followed by the Central Pacific, in employing to the same end all the surplus labor that can be found in that region.

Work upon this great enterprise is being pushed with increasing energy, as the two roads approach each other. The extraordinary accomplishments of the past bid fair to be eclipsed by the efforts of the future. It is said that railroad work will be done this summer which will astonish the country, notwithstanding the wonderful efforts in this direction with which we are already familiar. In addition to almost weekly shipments of iron from New York, *via* Cape Horn, the company has now made arrangements to ship *via* Isthmus, and will forward some 5,000 tons by this expensive route, during the present summer, in order to secure a full supply of that material to keep pace with the rapid progress of grading. It is said by a correspondent of the *Bulletin*, from whose letter we glean the above, that the managers are even talking of the possibility of being able to go from Oakland to New York by rail as early as the 4th of July, 1869. If such a thing can be done, the public may well put up with high rates of fare and freight for a year or two longer in aid of such an important consummation. A thousand good words and wishes for this noble work—this most extraordinary monument of human enterprise and energy.

SILK PRODUCTION.—I. N. Hoag, Secretary of the State Agricultural Society, has a large plantation of mulberry trees upon his ranch in Yolo county, just opposite Sacramento, where he is making extensive preparations for silk-worm feeding this summer. He has a cocoonery 50 feet square by 18 high, properly fitted up for feeding, with 9,000 square feet of feeding space. In connection with this cocoonery he has a well arranged breeding or hatching room. These accommodations are sufficient for making over two millions of cocoons. He has also another building 30 by 40 feet, which he can call into use if necessary. The breeding room is properly fitted up with means for artificial heating, when necessary. He has already commenced hatching and feeding, and at the present time, has about 800,000 worms in fine condition. He hopes to feed three million during the summer. That number of cocoons will be a very good product for one silk-grower; and if two or three others will start in with a like energy, we may hope soon to see silk-growing take an important position among the industrial interests of the State.

HENDY'S LATEST IMPROVED PATENT SELF-DISCHARGING SULPHURETS CONCENTRATOR.

FOR GOLD AND SILVER ORES,

With Revolving Stirrers and Rotary Distributor.

This machine is designed for saving finely divided Quicksilver, Amalgam and Gold from the sands, and for concentrating and saving the Sulphurets. Any person of ordinary experience with Quartz Mills can readily fit them up and run them.

Those in want of Concentrators would do well to visit some of the quartz mills that have Hendy's Patent Concentrators in use, and satisfy themselves before purchasing other Concentrators of pretended merit. **THEY ARE WARRANTED TO WORK SATISFACTORILY.**

Directions for Operating Hendy's Concentrators:

The sulphurets are drawn off while the Concentrator is in motion, in the following manner:
First—In setting up, set the pan, A, level by the inner rim, near its center.
Second—While in operation, keep the Pan, A, about half full of sulphurets. [See Figure 2, marked S.]
Third—Open the gate, E, sufficiently to discharge the sulphurets as they accumulate over the amount above mentioned.
Fourth—The crank shaft to make 200 to 220 revolutions per minute.

References:

Reference is made to the following mills, which have HENDY'S CONCENTRATORS in use:

EMPIRE MILL. (8 Concentrators).....	Grass Valley, Nevada County.
NORTH STAR M. & M. CO. (8 Concentrators).....	Grass Valley, Nevada County.
NORRIDGEWOCK MILL. (2 Concentrators).....	Grass Valley, Nevada County.
VALENTINE & CO., Commercial Mill (3 Concentrators).....	Nevada County.
HUMBOLDT CANAL CO. (1 Concentrator).....	Humboldt County, Nevada.
ROBINSON & McALLISTER M & M. CO. (3 Concentrators) Hunter's Valley, Mariposa County.	
PLYMOUTH ROCK MILL CO. (2 Concentrators).....	Calaveras County.
MIDAS MILL CO. (4 Concentrators).....	Virginia, Montana.
GOULD & CURRY G. & S. M. CO. (4 Concentrators).....	Virginia City, Nevada.
VULTURE CO. (8 Concentrators).....	Prescott, Arizona.
NOYES & CO'S MILL. (2 Concentrators).....	Prescott, Arizona.
LUCY MINING CO. (3 Concentrators).....	Owyhee District, Idaho.
MOREY & SPERRY (1 Concentrator).....	New York.
GUADALUPE & SACRAMENTO G. & S. M. CO.....	Sinaloa, Mexico.
EL TASTE CO. (2 Concentrators).....	Sonora, Mexico.
B. F. BROWN (1 Concentrator).....	Melbourne, Australia.
JAMES HENTY & CO. (1 Concentrator).....	Melbourne, Australia.

And in use in many other parts of this coast.

The following give additional proof of the increasing popularity of the machine:

SAN FRANCISCO, October 10th, 1867.

J. HENDY, Esq.—Dear Sir:—To your request for an expression, in writing, of my opinion in regard to the merits of your Concentrator, I reply, that I consider it the best machine for saving quicksilver and amalgam, and for concentrating sulphurets, that I have ever used, or seen used. I may add, that I could give you no stronger proof of this than to order, as I did, six more of them, after a trial of one for several months. I shall take pleasure in showing the machine in operation to any one interested, who will call at the mill of the Empire Company, in Grass Valley. Yours,

S. W. LEE, Supt.

NORTH STAR MINE, Grass Valley, Feb. 26, 1868.

J. HENDY, Esq.—Dear Sir:—In answer to your request, I give my opinion in regard to the eight Concentrators we have at work. We have had one at work on blanket washings for the past three months, and it has proved highly satisfactory in saving sulphurets and amalgam, that in past years we have been losing. Of the other seven, six are taking the pulp from the batteries, and the remaining one concentrating from the six, which, when thus reconcentrated, yield 95 per cent. of pure sulphurets.

Respectfully, etc.

W. H. RODDA, Supt.

SUPERINTENDENT'S OFFICE, GOULD & CURRY S. M. Co., }
VIRGINIA CITY, Nev., Sept. 17, 1867. }

JOSHUA HENDY, Esq., San Francisco:—Dear Sir:—According to the terms under which I secured from you four (4) of your Concentrators, namely—that they were to be paid for only after a thorough trial had demonstrated their value—I desire to inform you that I have tried them, and have found them to work very satisfactorily, and that they will now be accepted by the Company. You will please present the bill for said Concentrators, say \$1,200, at the office of the Gould & Curry Company in San Francisco. Yours, very truly,

LOUIS JANIN, Jr.

The bill was presented in accordance with the above request, and duly paid.

Four Concentrators have been forwarded to the Vulture mine, in Arizona, which makes eight for that mill. The additional order for four machines was made after a thorough trial, which proved their superiority over all others. [See Mining and Scientific Press of Dec. 14th.]

CAUTION.

All of HENDY'S PATENT CONCENTRATORS are marked thus:

"J. HENDY, Patented February 27th and April 17th, 1866."

California Pioneer Fuse

MANUFACTURING COMPANY,

MANUFACTURERS OF

HOSE AND TAPE FUSE,

A New and Superior Article for Blasting in
very wet ground, or under water.

Great difficulty has heretofore been experienced by miners, and others in the use of Fuse, which has been subjected to deterioration from exposure to dampness during transportation, or during the great length of time which has passed between its manufacture and use. In addition to great painstaking in the manufacture of the California-made Fuse, the above and many similar objections are entirely obviated, and the operator can always depend with certainty upon the burning of his fuse.

It is often the case that extra lengths are required, as exploding tunnels, etc., longer than is furnished in the imported article. Fuse of every desired length or size can be made to special order, at the above manufactory.

Manufactory, - - - Potrero, San Francisco.

Niagara.

This stupendous cataract, like everything
 else, is constantly changing. A Hyatt, in
 an article entitled "Rock Ruins," contrib-
 uted to the *American Naturalist* for April,
 says:

The recession of the present falls is an
 established fact. Father Hennepin, one of
 the early French explorers, described and
 figured Niagara as early as 1678. Then it
 had three distinct parts instead of two, as
 at present. On the Canada side a tabular
 rock of great size extended out interrupting
 and turning a portion of the overflow in an
 easterly direction, making a third fall at
 right angles, but continuous with the horse-
 shoe. About seventy years afterwards, a
 Danish naturalist, Kalm, records the disap-
 pearance of this rock, and describes the fall
 as having about the same general outline as
 at present. His sketch, however, does not
 differ materially from Father Hennepin's,
 except in the absence of the third fall.
 Parts of Table Rock fell successively in
 1818, 1828, and 1829, and Kalm speaks of
 the descent of portions of this rock, which
 extended under the water previous to his
 visit in 1750.

The future of the cataract may be read in
 the structure of the rocks, as well as its
 past. Prof. Hall, who has studied more
 carefully than any other geologist, predicts
 that Niagara is slowly but surely destroy-
 ing itself. Thousands of years hence and
 the cataract will have eaten its way back
 until the solid limestone layers, which are
 now on its verge, will be at its base. Here
 it will probably remain for a long time al-
 most stationary. The lower portion being
 as hard as the upper, will not be eaten out
 into caves and hollows as at present, but,
 being less exposed, will give way even more
 slowly than the upper limestones.

According to the estimate of Sir Charles
 Lyell, about 35,000 years ago the falls were
 at Lewiston. Now they are seven miles
 away, and have yet two miles to traverse,
 each step harder and more difficult as the
 shale becomes thinner, before they reach
 the point, where, should they preserve their
 present structure, they will be not over 100
 feet high. Following out Sir Charles Lyell's
 estimate, this would take 10,000 years, even
 if no allowance was made for the gradual
 retardation caused by the disappearance of
 the shale. Although these calculations are
 based upon the observed rate of retrogres-
 sion of the falls, they can only be very
 rough approximations, until sufficient time
 has elapsed for other observations to be
 made and compared with the monuments
 erected by Prof. Hall in 1842. They are,
 however, sufficiently close and reliable to
 show that Niagara was not carved out in a
 day, nor yet in a thousand years; but that
 for tens of thousands of years the steady rush
 of the river has ground the rocks to pow-
 der, and swept away, piece by piece, the
 solid layers, until the gorge it has cut is
 now seven miles long, from two to three
 hundred and fifty feet deep, and eight to
 twenty-four hundred feet wide at the top.

IRON FOR PEAR TREES.—"H," of East
 Woodstock, Conn., sends the Massachusetts
Ploughman his experience. After several
 years careful tending, a fine Madeline pear
 tree was about to be abandoned in disgust,—
 the fruit all dropping prematurely. But
 chancing to learn that some remarkable
 fine pears were grown on a tree which took
 the sweepings of a blacksmith's shop, he
 took the hint, and distributed a bushel of
 filings and turnings from a machine shop
 about his tree, stirring up the ground well.
 The next year he got a peck of fruit;—but
 the second year the tree was literally loaded
 with as nice Madelines as ever were grown.
 The tree has continued to give full crops
 ever since.

"I have," he says, "in the same yard,
 two old trees grafted with the Bartlett,
 which had borne but very few inferior pears
 until after I applied the iron, when they
 gave me full crops of fine fruit. I have
 been often questioned as to how I ripened
 my pears to give them such a beautiful
 golden color. I always tell them to use
 iron about their trees."

"BEAUTIFUL BIRD."—A new machine for
 navigating the air, invented by a Scotch-
 man, will be brought out under the auspices
 of the British Aeronautic Society. It is a
 sort of bird, with a body fifteen feet in
 length, and wings stretching out to the
 width of thirty-five feet. A tail reaches out
 behind to give direction to the movement,
 while the wings are flapped by an engine of
 forty-horse-power. This, it is thought, can
 be made to proceed through the air at the
 rate of forty miles an hour.

Our Future Motors.

The eighth edition of Mr. J. Bourne's "Treatise on the Steam Engine" has just been published. In the preface, the author says: "Before the first edition of the present work appeared, I had arrived at the conviction that the steam engine would pass away before very many years; and evidences of the soundness of this anticipation are presenting themselves every day. The most convenient substitute for the steam engine would be a thermo-electric engine. But very little of a practical character has yet been done in this direction. At present public expectation points more in the direction of air and gas engines; and both have been to some extent practically introduced. In the case of the steam engine there is this momentous fact to stimulate improvement—that even in the best and most economical engines, not more than one-tenth of the efficacy of the fuel is utilized as power. In the case of electro-dynamic engines, we know that there is little loss, or, in other words, that a given quantity of electricity produces very nearly its equivalent of mechanical power. With regard to the steam engine, I cannot say that any tangible improvement has been made in it within my recollection, and substantially it is the same machine that it was when dismissed from the hand of Watt; and it does not appear probable that any considerable improvement can now be introduced, except by some expedient which will enable higher temperatures to be employed with impunity. Superheating was one step in this direction. But it has been proved that where superheating is carried further than was usual in the old marine fine boilers, the lubrication of the piston and stuffing-boxes cannot be accomplished; and the valve faces and other internal parts of the engine are so much damaged by internal corrosion that the resulting injury outweighs the resulting benefit. Expansion is a resource always open to us; but the fact that practically it is employed to only a very moderate extent, sufficiently shows that it has drawbacks. Nevertheless, the tendencies of the last fifty years have all been in the direction of higher pressures and a larger measure of expansion; and nothing but the want of a boiler adapted for higher pressures than are now usual, has prevented the development from being carried out to a very much larger extent. Hitherto surface condensation has been of no use to steam navigation; as advantage has not been taken of it to introduce boilers capable of working safely with a much higher pressure of steam. A considerable step, however, in this direction is now imminent."

THE FLORENCE

RECEIVED THE HIGHEST PREMIUMS

At all the most important Fairs held in the United States in the year 1867. Gold Medals at the American Institute Fair, New York; Mechanics' Association Fair, Lowell; Maryland Institute Fair, Baltimore. Highest Premium at the New York State Fair, Buffalo, and at the Great New England Fair, Providence. At the Fairs held on the Pacific Coast, this machine has taken

Every First Premium

Awarded on Family Sewing Machines in the LAST FIVE YEARS. It there is a Florence Machine within one thousand miles of San Francisco, that is not giving entire satisfaction, if I am informed of it, it will be attended to without express charge or expense of any kind to the owner.

JOHN PERRY,

MANUFACTURER OF

Cocoanut Matting, Rugs, Mats, Etc.

And Cocoanut Fiber for Upholstery.

South side Chestnut street, bet. Polk and Larkin streets, SAN FRANCISCO.

BY A PROCESS ENTIRELY NEW, THE PROPRIETOR is now manufacturing in quantity sufficient to supply the demands of the trade, A NEW AND SUPERIOR MATERIAL FROM THE PINE OF THE COQUANT—the best substitute for curled hair hitherto discovered—for mattresses, chairs, lounges, and all upholstering purposes. The following are some of the advantages which it possesses over all other materials used for the above named purpose:

1st. It is cheaper, all things considered, than most articles in use.
2d. It is the best and purest material known in the market, being entirely free from all offensive smell.
3d. It is the most durable, not being subject to rot after years of exposure to moisture and dampness.
4th. It is remarkable for its elasticity, rivaling, in this respect, the finest curled hair.
5th. It contains nothing to breed vermin or support insect life, being entirely freed in process of preparation from all deleterious vegetable matter.
Lastly. It does not pack; is free from dust; much lighter, and in general obviates all the objections to pulp, prepared shavings, soap root, and other inferior substitutes for feathers and hair.

WANTED

—AT—

T. M. TURNER'S

NEW AND EXTENSIVE

Stock and Sale Yards and Stables,

Tenth and Howard Streets,

The Bull's Head of San Francisco.

TO FILL ORDERS:

50 LARGE DRAFT HORSES, 1,300 TO 1,400 POUNDS weight, and any number of Horses of 1,100 pounds and upwards, suitable for Car Horses, Job Wagon, Brewery, Buggy and Family Carriage; and also smaller Horses for Saddle and small vehicles; Mules, Milch Cows, Beef and Work Cattle, and all classes of Live Stock. Just arrived and coming daily, a fine lot of good American Horses, suitable for Draft, Driving, and all kinds of work.

The THOUSANDS of LIVE STOCK I have sold in the short time I have been here in business, is an indication of what I may do in the future. My Spring Auction Sales will commence now for the sale of bands of Broke and Unbroke Horses, and all classes of Live Stock.

Cash advanced on Stock for sale. Stabling and Corral room, with mangers and sheds for several hundred head of various kinds of stock at a time. Stock Raisers desiring to get thorough-bred Stock of any kind, can do so through me, as I am extensively acquainted with Stockmen of various parts of the country and Eastern States.

WANTED IMMEDIATELY.—Several hundred Horses. Half-breeds of the best quality will do, if weighing from 900 to 1,100 pounds. Letters for information about Stock promptly answered.

I HAVE LEFT A FEW PAIR OF THOSE fine thorough-bred ANGORA or CASHMERE GOATS, recently brought from Georgia, by Mr. E. Holland, from the celebrated flock of Mr. Potters, which stood a comparison at the World's Fair at Paris, and were pronounced as fine as any in the world, which I will sell at reduced rates from our former sales of \$100 a pair, in order to give stock raisers a chance; or, if desired, will sell ten or twelve Bucks at \$250 each, and reserve the Ewes. Full pedigree given of each one. 15v16-3m3t

Boarding and Lodging on reasonable terms. 22v16-qr

THE GOLDEN ERA.

Founded in 1852, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent.

THE GOLDEN ERA

It is the most universally popular of all the Weekly Journals. It presents forty-eight columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected matter. It is a welcome guest in Cottage and Cabin; the favorite at the fireside in city and country; the most useful, agreeable and altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe and elsewhere. Every household in the mountains and valleys, the cities, towns and mining camps of California, and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor. Inspired with the genius of the age, it is progressive, and aims not so much at distinction as a newspaper, as at honorable success in its capacity of a great Moralizing and Improving Influence. Exercising a positive power for good, and wielding a permanent influence, many able and eminent writers choose its columns as a means of communicating with the public. No effort will be spared to make it a thoroughly California newspaper, and worthy of the support of all classes of our citizens.

Can have an opportunity of doing so by applying to the undersigned, who are prepared to give practical instruction at reasonable rates. Apply to

JOHN AGRELL,

3v15-3m Jackson, Amador Co., Cal.

A GREAT INVENTION.—The *American Journal of Mining* for May 2d, illustrates and describes an electric Railway Signal recently patented. An ordinary battery is enclosed in a strong iron box into which leads a rod connected with the switch-bar. The arrangement is such that the galvanic circuit,—which is broken when the switch is all right,—is completed when the switch is misplaced; and by means of underground and insulated wires, animates an electro-magnet in the signal-house, setting in motion an alarm bell, to call the attention of the switch-man, and at the same time exhibiting to the driver of an approaching train, the red signal of danger instead of the white light of safety. The signal-house may be at such a distance from the station as to allow ample time to "break up" in season to avoid the danger. The alarm is kept up, and the red signal displayed, as long as the circuit is closed; which must necessarily be the case as long as the switch,—or the draw-bridge, as the case may be,—is misplaced.

MOSHEIMER'S Pioneer Mining School, ASSAY OFFICE —AND— Metallurgical Works, SAN FRANCISCO.

Having established the first Practical Mining and Metallurgical School in the United States, I would call the attention of gentlemen who may wish to obtain a practical knowledge of Chemistry, Metallurgy, etc., to the fact that I am now prepared to teach the following branches:

- 1.—**Assaying of Ores, Metals, and other Mineral Substances.**
- 2.—**Metallurgy of Gold, Silver, Copper, Lead, etc., by Smelting, Amalgamating, Lixivation, etc.**
- 3.—**Gold Extraction, by Chlorine Gas; also, a modified process of the same, which is cheaper and quicker than the processes usually employed.**
- 4.—**Concentration.**—Dressing of Ores.
- 5.—**Construction of Furnaces, in which any kind of fuel may be used for Smelting, Roasting, etc., as well as the erection of any Machinery or Apparatus required in Metallurgy and Technology.**
- 6.—**Technology, or Chemistry as applied to any special branch of Manufacturing.**

By my Practical Mode of Teaching, any person of ordinary ability can learn to assay Ores in three lessons, and the working of all the ordinary and refractory ores in a few weeks.

Gentlemen of almost every profession, who, within the last two years have graduated at my establishment, will bear testimony that from my instructions they have learned more in a few weeks than they ever expected to learn.

My charges are from \$50 to \$200.

Ores of every description assayed and worked

POSTMASTERS are requested to punctually inform us of the removal of subscribers of the Press from their locality, or of neglect to take the paper out of the office from any cause—when the subscriber omits that duty himself. It is not our intention to send this journal to any party longer than it is desired. If we inadvertently do so, subscribers and others will please inform us.

Important to Californians.—Many inventors have lately had their claims for Patents seriously and in some cases fatally delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. THE *MINING AND SCIENTIFIC PRESS* PATENT AGENCY has strictly complied with the requisitions of the Department, and properly filed all necessary papers as Claim Agents.

For passage and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sansome and Leidsdorff streets.
OLIVER ELDRIDGE, Agent.

By MAIL.—The *Mining and Scientific Press* will be sent by mail to any part of the civilized world. In case of removal subscribers have only to inform us of the post office address of their old and new location, and the paper will be sent accordingly.

AN INSTRUCTIVE BOOK!

Prof. LAYRES'

ELEMENTS OF COMPOSITION,

BELLES-LETTRES AND ORATORY

For Scholars, Teachers, Lawyers all Professional Persons, and those of Common

Education, who would improve the Eloquence and Effectiveness of their Composition and

Managers of Address.

Price, postage paid, \$1.10

This is a new publication, and in style and treatment of this important subject, is original, simple, plain and comprehensive. The author, Prof. LAYRES (a meritorious Teacher of good standing in California, and a sound thinker and reasoner), in his preface says: "The method pursued by the Author in developing the subject of Composition, is both the synthetical and analytical. The former is necessary to teach the theory, the latter the practice of the art; and as these are both indispensable to the scholar, so are also the two methods, as the sequel will show."

The Work has lately been approved and authorized by the State Board of Education for use in the Public Schools. To further illustrate the varied and popular endorsement the book has rapidly received, we quote the following

RECOMMENDATIONS:

It is simple, concise, and well arranged. It seems to be a work of great value.—*John Scott.*

I am prepared to concur in the recommendation of the Honorable Superintendent of Public Instruction.—*J. C. Pelton.*

After a careful and thorough perusal of the same as it was in my power to give, I came to the conclusion that, for conciseness, correctness, and precision of definition, as well as for completeness and simplicity in its arrangement as to be readily understood by the advanced pupil.—*F. W. Hatch.*

It is admirably arranged to develop the correct idea of the analysis and synthesis of language, and the amplification of ideas into sentences and periods. The style is clear, terse and pleasing. I do not hesitate to recommend it as a great acquisition to our text books.—*James Denman.*

I am happy to express my conviction of the value of the whole treatise. It would give me much gratification to see it thorough and excellent as a treatise emanate from young California.—*Martin Kellogg.*

I recommend it to all those who wish to obtain a book that will give them definite ideas on this subject, and teach them to express their thoughts and feelings in a clear, simple, and forcible manner.—*Caroline L. Atwood.*

I regard the book about to be published as far superior to any work extant upon that subject.—*Wm. S. Hunt, A. M.*

I believe the work will be a valuable and much needed addition to our school text-books.—*Herman Perry.*

You have brought the results of a profound analysis, and made them available, in a practical form.—*J. H. Brydson.*

I can recommend it particularly to my young friends of the legal profession, as a source from which they may be able to learn much of value as special pleaders and as advocates at the forum.—*John Curry.*

The subjects upon which you treat have heretofore been too much neglected in the education of young men in America. * * * Exactly calculated to interest. * * * It will soon become a necessity in every lawyer's library.—*Charles A. Tuttle.*

Its clearness and comprehensiveness make it easy.—*G. W. Boice.*

A gentleman of varied learning and ripe culture, who has half a dozen languages at his tongue's end, who has taught the student not only how to teach sentences apart, but how to construct them. His system has the merit of originality. We know of no work in which so much can be obtained as he has an exposition of the elements of composition, and such valuable assistance in learning how to put his ideas into language. Prof. Layres has done the cause of popular education good service.—*S. F. Bulletin.*

This is a San Francisco book by a San Francisco author. It contains 166 pages, and is altogether creditable to San Francisco. It meets a public want, and meets it in a form and size cheap and convenient, and to reach of the humblest.—*Alta California.*

The writer, the lawyer, the minister, or the statesman, may study its rules and definitions with profit. Nothing conduces more to the purity of a national literary taste than a general and thorough knowledge of the rules by which the construction of language is governed.—*S. F. Times.*

Prof. Layres plunges at once "in medias res." He seizes a sentence (which is the unit in composition, whether written or spoken), holds it up before you; and it is to pieces before you eyes—or rather, we should say, neatly and skillfully dissects it—displays one by one its several parts, makes you thoroughly acquainted with each, in its entirety; and then shows you how to put them together again. A series of such experiments, increasing in complexity so gradually that you do not feel the difficulty, and the thing is done; you are master of the subject.—*Mining and Scientific Press.*

Its design is to show that ideas can be so arranged as to increase their power; in short, to teach the mechanism of composition, eloquence and oratory. A desideratum long felt is supplied.—*S. F. Examiner.*

This is an age in which the occasions are rapidly multiplying, when educated men and women, too, are called upon to express their views in writing, either for public or private inspection and criticism.—*Stockton Independent.*

The most eminent educators in California give it their hearty approval, and we concur.—*Mercury Appeal.*

Not only one of the best of its kind, but what is still better, one of the briefest. It contains 166 pages.—*Virginia Enterprise.*

Price, \$1.10. Sent by mail, postage paid, without extra charge. Liberal reductions made to the Trade, Teachers and Schools, ordering by wholesale. Orders received by our Traveling Agents.

Address OWEY & CO., Mining and Scientific Press, San Francisco.

THE GLOBE MINING CO. OF ALPINE.—We condense the following notice of "a live company," from the *Alpine Miner* of June 6th: This company has taken the necessary legal steps to increase its capital stock from \$100,000 to \$500,000, to be divided into 50,000 shares of \$10 each. Ten thousand of these shares will be placed in the New York market for the purpose of raising a working capital. The ledge has a splendid outcrop more than 100 feet wide, and is most favorably located for economical development. A tunnel 500 ft. in length will strike it at a depth of 250 ft. below the outcrop. The development of the mine will be pushed with all energy. "If," says the *Miner*, "capitalists in San Francisco or the East could but comprehend the remarkable geological and mineralogical structure of the deposit upon which the Tarshish, Esmeralda, Morning Star, Globe and Imperial No. 10, are representative claims, money for the development of our mines would be speedily forthcoming. Every one who examines for himself, is fully satisfied of the ultimate grand success of this region, and we are glad to observe, too, that they understand the necessities of the case—money to open up with—and prepare for real mining operations."

COLUMBIA FOUNDRY.—We alluded last week to the removal of this establishment. We understand that Mr. Reese Llewellyn and Mr. Stephen Fletcher—both well known here as skillful and practical workmen in connection with our foundries, have formed a copartnership with the intention of making a specialty of door-fronts, sash-weights, etc., under the firm name of Llewellyn & Fletcher, at 133 and 135 Beale street, in this city. We recognize in Mr. Fletcher an old acquaintance, engaged for some years in this same line of business at Grass Valley, Nevada county.

NEW PLANING AND SAWING MILL.—Mr. Metcalf is erecting a large lumber, planing and sawing mill, on Berry street, near Fourth. The building will cover a 50-vara lot, and will be two stories high.

New Mining Advertisements.

Bear River Mining Company, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the tenth day of June, 1883, an assessment of one dollar per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on the fifteenth day of July, 1883, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the third (30) day of August, 1883, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. M. BUFFINGTON, Secretary.
Office, Room 37 New Merchants' Exchange, California street, San Francisco. my3

Subscribers who do not receive the *Mining and Scientific Press* in due time, are requested to inform the publishers,

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the
PACIFIC FOUNDRY,
151 1st St. San Francisco.

Hunt's Patent Wind-Mills, Tread
Horse-Powers, Sweep Horse-Pow-
ers, (for one or four horses), Saw-
ing Machines, Pumps of all kinds
for shallow or deep wells, in-
cluding Hunt's Submerged Pump,
Hunt's Globe Pump, and Hunt's
Single and Double-Acting Pump.

Pumping Machines and general
Machinery kept constantly
on hand and built to order.

Also, Water Tanks of all sizes.
Having put up large new buildings specially for my busi-
ness, with greatly increased facilities in the way of room
and steam power, I shall be able to build everything in my
line at greatly reduced rates.

All desirous of procuring water for irrigating or other
purposes, are invited to examine my articles before pur-
chasing elsewhere.

23v16 E. O. HUNT, Proprietor.

OIL STOVES!

MORRILL'S

Petroleum and Universal Oil Stoves

Have proved themselves a superior substitute for Wood
and Coal stoves, in that they work quietly, are cleaner,
bake and broil better, are MORE ECONOMICAL generally.
They are portable, can be used in any room, with or with-
out chimney, as they emit no smoke, soot or ashes. There
are nine different sizes designed for barbers, dentists, and
other mechanical purposes—as well as for cooking. They
are perfectly safe.

I now offer a reward of \$100 for every Petroleum Stove
exploded by Naphtha delivered at my store, 13 Geary
street, where they are for sale by

M. B. BULLARD,

Proprietor of Petroleum Stove for California, and Agent
for Universal Oil Stove for Pacific Coast.

N. B.—Petroleum Stoves burn Naphtha, converted into a
gas. Universal Oil Stoves burn Naphtha, Benzine, or Coal
Oil, with non-illuminating flame and light on a wick as
easy as a lamp.

Brodie's Patented Improvements

FOR THE TREATMENT OF

Gold and Silver Ores.

BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER.
The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:
No. 1.—Or 10 inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price.....\$600
No. 2.—Or 15 inch Crusher, capable of similarly putting through five to six tons per hour.....\$850
No. 3.—Or 18 inch Crusher, will in a similar manner crush from seven to eight tons per hour.....1,200
These Crushers have been erected at several mines in the State of Nevada, and others in Calaveras, Tuolumne and Mariposa counties, to whom applicants can be referred as being the most efficient, cheapest, and least weight compatible with strength and durability, of any Crusher yet erected.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—Diagrams and explanations afforded on application to the subscribers.
A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866.

A SAFE,
CERTAIN,
AND
Speedy Cure
FOR
NEURALGIA,
AND ALL
**NERVOUS
DISEASES.**
Its Effects are
Magical.

It is an UNFAILING REMEDY in all cases of Neuralgia
Facialis, often effecting a perfect cure in less than twenty-
four hours, from the use of no more than two or three
PILLS.

No other form of Neuralgia or Nervous Disease has failed
to yield to this

WONDERFUL REMEDIAL AGENT.

Even in the severest cases of Chronic Neuralgia and gen-
eral nervous derangements,—of many years standing,—
affecting the entire system, its use for a few days, or a few
weeks at the utmost, always affords the most astonishing re-
lief, and very rarely fails to produce a complete and perma-
nent cure.

It contains no drugs or other materials in the slightest de-
gree injurious, even to the most delicate system, and can
always be used with

PERFECT SAFETY.

It has long been in constant use by many our most

EMINENT PHYSICIANS,

who give it their unanimous and unqualified approval.

21v16tf JOHN J. FULTON.

BEE-HATERS.—The Boston Journal says
"the people of Wenham, Mass., have voted
by a two-thirds majority, that no bees shall
be kept in the town; the vote being di-
rected against an extensive bee-keeper whose
stock has been troublesome." The Ameri-
can Naturalist says: "Have we gone back
to the Dark Ages?" The Bee Journal makes
some remarks upon the subject, from which
we quote: "A silly prejudice against bees
is entertained by some fruit-growers, based
on the notion that the crops of fruit are in-
jurious affected, both in quality and quan-
tity, by the visits of bees during the blos-
soming period. A more unfounded notion,
or one deriving less support from observa-
tion and science, can scarcely be conceived;
yet it regularly looms up once or twice in a
century."

The fact is, as has been repeatedly proven
beyond a question, that bees are decidedly
beneficial rather than otherwise; causing
the fruit to set, by conveying the fertilizing
pollen from flower to flower. Many in-
stances can be cited, where the crop of fruit
was at once, and permanently, rendered
more abundant and more regular, by the
introduction of an apiary into the orchard.
Ten years ago, the celebrated pomologist,
Prof. Lucas, at the Apian Convention held
at Stuttgart, said that the interests of the
horticulturist and the bee-keeper "run par-
allel with each other."

A NEW PRINTING INK.—The following is
from the foreign correspondence of the
Philadelphia Printers' Circular:

"A new ink for printers has been invent-
ed by Professor Artus and Mr. Fleck-
stein, a master-printer at Lichtenhain, near
Jenna, which is said to be a complete suc-
cess. The composition of it is as follows:
Venetian turpentine, 4½ ozs.; fluid soap, 5
ozs.; rectified oleine, 2 ozs.; burnt soot, 3
ozs.; Paris blue, (ferro-cyanic acid), ½ oz.;
oxalic acid, ¼ oz.; distilled water, ¼ oz.
Gradually warm the turpentine and the
oleine together; put the soap on a marble
plate, and gradually add, continually rub-
bing, the mixture of turpentine and oleine;
when well mixed, add the burnt soot, which
must be well powdered and sieved before;
then add the Paris blue, dissolved in the
oxalic acid, continually rubbing the com-
position on the stone, the Paris blue and
the oxalic acid having been mixed be-
fore with water in the above given propor-
tion. A solution of soda in water is suffi-
cient to thoroughly cleanse the type."

ENGLISH EXPRESS ENGINES.—Several new
and powerful engines, especially for run-
ning heavy express trains, have recently
been put upon the Great Northern Railway.
The Boston Railway Times says: "These
engines have recently completed the jour-
ney from King's Cross to Peterborough, a
distance of seventy-seven miles, in one
hour and twenty-eight minutes, although
they had to contend with heavy gradients
for forty miles of the distance, and with
twenty carriages behind them. The leading
dimensions of these engines are as follows
viz: The driving and trailing wheels are
7 ft. in diameter, and coupled together; the
leading and tender wheels are 4 ft. 3 in. in
diameter throughout; the barrel of the
boiler is 10 ft. 1 in. long by 3 ft. 10 in. in
diameter inside in the smallest part; the fire-
box casing is 6 ft. 4 in. long by 4 ft. 10
outside; the cylinders are 17 in. in diame-
ter, with a stroke of 24 in.; the heating sur-
face in box is 114½ square feet, and in the
tubes 907 square feet, making a total heat-
ing surface of 1,021½ square feet, with a
grate surface of 19½ square feet; the ten-
der holds 2,500 gallons of water and two
tons of fuel; the propelling power of the
engine is equal to 12,000 lbs. and the ad-
hesion on the rails may be taken at 11,700
pounds."

A LAND OF HONEY.—Messrs. A. J. Cook
and J. H. Matthews, of Corralitos, returned
to this place a few days ago from a trip to
the lower part of Monterey county, bringing
back with them over 600 pounds of fine
honey, which they gathered in four days
between the Masento and San Antonio
rivers. These gentlemen report bees and
honey very plenty in that locality, and had
they vessels to hold it could have secured
much more.—Watsonville Pajaronian, May
28th.

ELECTROTYPED CUTS, ENGRAVINGS, ETC.—Our Job Printing
Office is abundantly supplied with elegant engravings, or-
naments, and other embellishments to suit the various
branches of industry in this State

WOOLEN MILLS will soon be found in every portion of the State. A building 120 feet long by 50 wide, designed for a woolen factory, is nearly completed at Merced Roads, Mariposa County. A large portion of the machinery for the same is already upon the ground.

BUERK'S Watchman's Time Detector.

THIS WATCH-CLOCK WAS INTRODUCED TO THE public in almost every section of the United States and Canada about five years ago, and it has proved itself to be the best invention in the world for testing the faithfulness of Watchmen. Since its introduction, the Proprietor has improved on some parts, and corrected deficiencies, and he has now

A Perfect Check upon the Watchman.

With other Clocks, a regular routine has to be followed, but with this Watchman can be ordered to visit any particular place as often as required, without being compelled to go to places where it is not necessary to visit as often. The instrument is complete in itself, portable, and as reliable as the best lever watch.

It is not so likely to become disarranged in its works as a good watch, because its parts are stronger. But when it needs cleaning, any common watchmaker can adjust it, its mechanism being simple. It requires no fixtures or wires communicating from room to room, as is the case with the ordinary Watch Clocks; a small, inexpensive stationary key is alone required at each station. By its use places can be guarded that it would be impossible to guard with any other instrument, such as Railroad Tunnels, Bridges, Yards, Shops, etc. The instrument will in all cases be warranted perfect and satisfactory. Its price is invariably *Twenty-five Dollars*, cash on delivery, including as many keys as are requisite, not exceeding twelve.

THIS WATCH-CLOCK IS SOLD AT A LESS PRICE THAN ANY OTHER IN THE MARKET.

The DETECTOR is used extensively by large Manufacturing Establishments and Railroad Companies in the United States, from whom numerous testimonials have been received.

23—This Detector is covered by two U. S. patents. Parties using or selling these instruments without authority from me will be dealt with according to law.

N. B.—Parties purchasing these Clocks should test them sufficiently in the counting-room or office, as they will not be taken back after having been injured by the Watchman through carelessness.

All communications promptly attended to. Address
J. E. BUEK, Proprietor,
47 Congress street, Boston.
P. O. Box, No. 1957. 23v16 6m

To Mine Owners.

THE SUBSCRIBER, HAVING HAD MANY YEARS EXPERIENCE in Mining and drag business connected with Mining Operations, offers his services to parties wishing to purchase mines, to examine and report upon them, to buy, report upon the titles of any mine offered for sale, and to transact any business connected with mining operations in this District. Also, he would take the Superintendency of the affairs of a Mining Company. Refer to proprietors of Mining and Scientific Press. Address—

Nos. 17 and 19 Front street, San Francisco, and 9, 11, 13 and 15 J street, Sacramento.

Wood & Mann's Portable Steam Engines, 6, 8, 10, 12 and 15 horse power,

With newly invented Water Bottom, which entirely surrounds the fire grate and ash-pit, forming underneath the ash-pit, and to the sides of the furnace, a three or four inch water space, by which additional heating surface is obtained, the accumulation of sediment around the fire-box or furnace is entirely prevented, and renders it perfectly safe to use near any barn, or in any farm-yard, or in any building where a stove would be allowed, as no sparks can possibly escape from the furnace or ash-pit. The sediment has a free passage to the bottom of the fire box, and can be blown off daily by the blow-off cock underneath the ash-pit, by which means the boilers may be kept clean much longer than under the old system. The great saving in repairs which is effected by the use of these water bottoms, and the constantly increasing demand for them, prove their superiority to any others yet constructed.

Our Patent Agency.

THE PATENT AGENCY OF THE MINING AND SCIENTIFIC PRESS
has been signalized with remarkable success during the
past two years. The importance to the inventive genius of
this coast of a thorough and reliable agency for the sollec-
itation of LETTERS PATENT from the United States and foreign
Governments cannot be over-rated, and the Proprietors of the
Press, feeling the responsibility which rests upon them, and
the reward which must follow the faithful performance of
their trusts, will take care to afford inventors every advan-
tage to be secured to them through a competent and re-
sponsible agency upon this coast.

MOLESWORTH'S POCKET-BOOK FOR CIVIL AND MECHANICAL ENGINEERS.—We acknowledge the receipt, from the publisher, Henry Carey Baird, of Philadelphia, of a copy of this valuable little work. It contains a multitude of useful formulae, and memoranda; and will be found valuable, not only for civil and mechanical engineers, but for miners, gas-fitters, millmen, and in fact "any other man." By its aid, the miner may so inform himself, before commencing a reservoir, a ditch, or a tunnel, that he can proceed understandingly, and without the fear that his work, like so many of the same sort in California, will have to be abandoned before completion,—and remain to be laughed at as a monument of his folly. He will be able to determine for himself the necessary size and position of his tunnel-timbers and water-pipes; and the kind of water-wheel suited to the head and fall of water which he can command. The gas-man may, with the help of this little manual, ascertain in a moment the exact size of pipe required for a certain number of burners, and the laws which govern the motion of gas in pipes. The millman may have ready at hand a thousand little facts in relation to shafting, pulleys, gearing, strength of iron and timber, etc., etc.—the knowledge of which is to him indispensable, but which it would be a matter of impossibility to retain in the memory. A supplement is added by J. T. Hurst, Civil Engineer, containing a number of tables which alone are worth the price of the book. The publisher's price is \$2. This is of course in currency, and for this sum it is forwarded to any address free of postage.

THE PACIFIC QUARTZ ROOFING COMPANY, under the management of Messrs. Meredith & Carrighan, which has been operating for some time at Folsom, is making arrangements to establish themselves in this city. We shall make a full notice of this new roofing material next week.

CORRELATION OF ELECTRICITY AND MAGNETISM.—The article in our last issue with the above heading, should have been credited to De La Rive's Memoir of Faraday.

As if by magic comes repose,
Forget thy pain, forget thy woes.

This harmless Remedy stops all pain instantly, and leaves no stain. The tongue cannot mention any physical pain that this Paini will not remove in five minutes. Whether a frightful Burn, a gripping Colic, or a simple Mosquito bite, the result proves an entire relief from distress at any spot or place where applied. It is perfectly adapted not only for all pain, but also permanently cures the worst Ulcers, Piles, Cancers, or breaking out on any part of the body, and all internal complaints, by an outward application to the parts affected.

MOORE'S PAIN ANNIHILATOR, a standard remedy for Catarrh, Cold in the Head, Inflamed Eyes, etc., sold by all druggists.
O. H. MOORE, Inventor and Solo Proprietor, 632 Market street, San Francisco, Cal. 21v16-3m

SAVE YOUR TEETH.—Drs. Jessup & Beers, over Tucker's jewelry store, are now making a specialty of filling the fangs of dead Teeth, and building up broken crowns with pure gold—thus restoring them to their original usefulness and beauty. They are also using Nitrous Oxide for the painless extraction of Teeth, when so desired—the only absolutely safe anesthetic ever discovered. In breathing it, it acts as a gentle stimulant, without undue excitement,—the sensation produced being truly delightful, the effect upon the lungs healthful, and in its results positively free from all danger. Prepared and administered daily at the Dental Rooms of Messrs. JESSUP & BEERS, corner Montgomery and Sutter streets, San Francisco. 16v16d

CO-OPERATIVE UNION STORE.—This is becoming one of the most useful Institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions 20 per cent. cheaper than ever before, and the very best articles in the market. The store is located at 115 Sutter street, Lick House Block, San Francisco. 6v16-am

American, Waltham, Watches—The Best, The Cheapest.

Recommended by Railway Engineers, Conductors and Expressmen, and the most exacting class of watch-wearers, as superior to all others for strength, steadiness, accuracy and durability.

Unscrupulous importers occasionally place a worthless Swiss imitation in the market. To avoid imposition, the purchaser should invariably demand a certificate of genuineness.

For sale by all respectable dealers.

PAINE & STEPHENS' IMPROVED CONCENTRATOR,

For Saving Gold and Silver Sulphurets.

This invention, a perspective view of which is given above, consists in applying machinery to the ordinary buddle, and rendering the same automatic in action. It is calculated to do a large amount of work.

One Machine, costing about \$1,400, is sufficient to work the Sands from 25 to 30 Stamps. But very little power is required.

It can be easily run by one man turning a crank. The principle on which it works is entirely dissimilar from any other machine now used on the Pacific Coast; although it is in almost universal use in Europe; but not so arranged there as to be automatic in action.

The illustration given herewith, was fully described in the Mining and Scientific Press of March 21, 1868.

One of these machines may be seen in constant operation at the Eureka (Watt's) mine in Grass Valley, where it is giving the fullest satisfaction, and is working all the tailings from thirty stamps. Another machine may be seen at the Banner mill, in Nevada, and a third below the Gould & Curry Company's mill, near Virginia City.

For further information, apply to THOMAS N. PAINE, Grass Valley, California.

PAINE & STEPHENS.

HUNGERFORD'S IMPROVED CONCENTRATOR,

For Saving Gold, Sulphurets, Quicksilver, etc.

FIG. 1.

There is no description of machinery of so much importance to the mining interests of California, at the present time, as that for the separation of sulphurets. Mines are now abandoned, or, what is worse, paying assessments, which, if the sulphurets were saved, would yield handsome dividends. Great difficulty, owing to the varied form and character of the sulphurets, has been experienced in devising a machine to separate them; and it is only by close and patient observation, persevering study and careful experiment, that any machine can be made or matured so as to save a large percentage of them. The best is that which saves most with the least expenditure of time, money and power. Many have been tried, and abandoned; and none seems to meet the requirement of the mining interest so well as that now patented by Mr. Hungerford, which is an improvement on the well-known Hungerford & Prater Concentrator, with which his name is already so familiar.

Fig. 1 is a perspective view of that pan as now constructed. For economy of space and machinery, one shaft is made to drive two pans, which are set and arranged as shown in the engraving.

FIG. 2.

It should be borne in mind that Mr. Hungerford is the original builder and maker of the celebrated Prater Concentrator, and his name should be sufficient guarantee to warrant the public in examining his new machine before purchasing elsewhere.

RECOMMENDATIONS:

OFFICE OF THE ONEIDA MINING COMPANY,
JACKSON, May 13, 1868.

Mr. MORGAN HUNGERFORD—Dear Sir:—In regard to the four Hungerford Concentrators that I bought of Messrs. Goss & Lambard, last month, I will say that I put them up in the Oneida Mill soon after I arrived here, and find that they save sulphurets well and clean, and work to my entire satisfaction. I have tried many other concentrators, but these stand up and work better than any other I have used. I have ordered Messrs. Goss & Lambard to make eight more for me as soon as possible.

Very truly yours,

JAMES MORGAN.

BIG OAK FLAT, May 23, 1868.—Mr. Thos. Mulford—Dear Sir:—I have used two of Mr. Hungerford's Concentrators in the Rattlesnake Quartz Mill, at this place, and find that they work full as well as they are represented to do.

E. M. SMITH, Supt.

These Pans can be seen at the Pioneer Mills, entrance on Stephenson street, San Francisco. In future these Pans will be manufactured exclusively by GOSS & LAMBARD, of Sacramento, which is a guarantee that they will be built in the most substantial manner. Price, \$300. Address, Goss & Lambard, Sacramento, or M. HUNGERFORD, San Francisco.

W. T. GARRATT,

Manufacturer of Brass, Zinc, and Anti-Friction or
Babbet Metal Castings;
CHURCH AND STEAMBOAT
BELLS,

TAVERN AND HAND BELLS AND GONGS,

FIRE ENGINES, FORCE AND LIFT PUMPS,

Steam, Lignol, Soda Oil, Water and Flange Cocks, and
Valves of all descriptions, made and repaired. Hose and
all other Joints, Spelter, Solder, and Copper Rivets, &c.
Gauge Cocks, Cylinder Cocks, Oil Cocks, Steam Whistles,

HYDRAULIC PIPES AND NOZZELS

For Mining purposes, Iron Steam Pipe furnished with Fittings, &c. Coupling Joints of all sizes. Particular attention paid to Distillery Work. Manufacturer of "Garratt's Patent Improved Journal Metal."

Highest Market price paid for OLD BELLS, COPPER AND BRASS. 61f

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING. 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELFET COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, \$125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are various and expensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v16-1y16p

VOLUME XVI.
Number 25.

Passing up the main stairway, and turning to the right and left, at the ascent, the visitor reaches the main Library Room, through a large upper hall or vestibule. The opposite walls of this hall are ornamented with two magnificent photographic views—the one representing the Coliseum of Reme, as it now appears in its massive and stately ruins, the other being a view of

Volatility of Gold and Silver.

NUMBER TWO.

In our issue of May 23d, we made some notice of a series of experiments by Mr. James Napier, Assayer at the time for the Mexican Mint, with regard to the volatility of gold and silver. As the article appears to have attracted some degree of interest, we have ventured to continue further notes upon the same subject, as follows:

Gold evaporates just as water, or ether, or zinc, or any other substance which assumes the vaporous state. Its remaining fixed in the fire or going off in vapor is entirely a question of temperature; but it should be added that our gold melting furnaces seldom approach that intense heat at which any loss of gold from pure evaporation can take place. It was found, when gold was melted in the focus of the great Italian burning glass, that it fumed away in vapor; and that a silver ball held in contact with the vapor was palpably gilt. Again, St. Claire Deville, during his classical experiments on a new mode of working the metals of the platinum ore by an oxyhydrogen blast, found that, operating on platinum containing gold, he could vaporize and distill the gold out of the baths of platinum just as zinc or cadmium or mercury are distilled at lower temperatures; so that in fact there is no reasonable doubt of the volatility of gold. But the question as to loss of gold by this volatility during the ordinary melting operation is not altogether as simple as we have put it; gold is seldom in the state of the pure metal, and it is often purposely alloyed during its passage through the melter's hands; and it then becomes a question whether the gold, thus alloyed with metals of easier volatility, does not evaporate in company with them at a temperature lower than that at which pure gold takes the state of vapor. Mr. James Napier quotes the experiments of Kunkel, who states that after keeping gold exposed to the highest heat of a glass furnace for two months, he found no sensible diminution or alteration of weight. Kunkel, it may be remarked in passing, has the credit of having invented, or at least of having developed, the art of communicating a ruby color to glass by the use of gold. Napier makes his first experiments with nearly pure gold, with the corset gold resulting from the ordinary assay, and which contains usually a little silver with possibly very delicate traces of other metallic impurities. The following table shows the results of these experiments:

	Weight of gold used, grs.	Time kept in fire, hours.	Loss in weight, grs.
No. 1.....	20	7	0.12
No. 2.....	50	7	0.12
No. 3.....	100	6	0.11
No. 4.....	100	8	0.12

No. 1 was weighed at the expiration of each hour, and lost exactly 0.01 grain per hour.

These experiments, according to Mr. Napier, do not show an exact uniformity of loss, but they prove that gold, even when pure, can be volatilized by the heat of a common furnace; the inequality of the results is accounted for by the inequality of the heat of the fire.

In the fourth of the above experiments, a most interesting result was obtained, and one which points out beyond doubt that gold is volatile when in fusion. The gold in this experiment was melted in a small fire-clay vessel, a cupel of house-ash being inverted over it, and kept so during the whole time of fusion. On removing the whole from the fire, it was observed that the inverted cupel was tinged with a purple color—and not only on the surface, but to a little depth. The surface of this cupel was carefully examined with a strong lens, to see if there were any small shots of gold upon it; finding no shots, the purple color was scraped off and assayed, by which means a small button of gold weighing 0.06 of a grain was obtained. This, of course, was only the one-half of what the button had lost altogether, as the junction between the small melting-pot and the inverted cupel was not perfect, and consequently some of the metallic vapor escaped; some of it was also deposited on the sides of the earthen crucible. In what state this gold passes off has not yet been determined. These experiments were repeated many times, with nearly the same results.

From these experiments, Mr. Napier passes to others performed on alloys of gold with copper. He states that, with such alloys as those formed for minting, it is well known that a working loss, due to the gold passing off in the vaporous state with the copper, is experienced; and he further proceeds to state that in pouring the alloy of gold and copper from the black lead crucibles in which it was melted, a vapor was observed to rise from the mass, in such an amount as to indicate under the circum-

stances that the alloy itself must be passing off. Then he goes to experiment.

A common glass jar—used for collecting gases in the laboratory—was obtained, made wet inside with distilled water, and held about four inches over the crucible, as the alloy was in the act of being poured into the molds. This occupied about one minute of time. On removing the glass, it was entirely coated inside with small metallic globules, which were washed out with distilled water, dried, and examined with a lens. The whole was then weighed, giving 4.8 grains, which afforded after cupellation a button of pure gold weighing $4\frac{1}{2}$ grains. These results were confirmed on repetition of the experiment.

Mr. Napier next proceeds to the inquiry of how much gold is really lost when kept in fusion with different proportions of copper for a length of time. He melts his alloy in small fire-clay pots in a common assay muffle; the copper is rapidly oxidized, causing a considerable loss of gross weight. To obtain the actual loss of gold, the resulting buttons were assayed with the following results:

	Wt of gold in grs.	Wt of cop. in grs.	Time in fusion, hours.	Loss of gold in grs.
No. 1.....	100	12	6	0.234
No. 2.....	100	10	4	0.210
No. 3.....	100	20	4	0.450
No. 4.....	100	10	6	0.300

In No. 1 the heat was only sufficient to melt the alloy; in Nos. 2 and 3 the heat was a little greater than in No. 1; and in No. 4 it was as strong as could be obtained in the muffle.

These results are stated to show that the greater the amount of copper and the greater the heat, the greater is the amount of gold lost; and that gold when alloyed with copper is more volatile than when alone.

HISTORY OF A TELEGRAPH CABLE.—The cable which is to connect Cuba and Jamaica with Panama, was originally manufactured in London, to connect Asia and America by way of Behring's Straits, and was shipped to Victoria. But the success of the Atlantic cable was the death blow of the Pacific company, and the cable was not shipped. The East India Telegraph Company then proposed buying it, to be used in China, but the negotiation failing, it was ordered to California. Before, however, it could be appropriated, other parties came in and purchased it, and now, never yet having been disturbed since being shipped from London in 1865, there seems every probability that it will finally find a resting place, filling its ultimate mission as a link in completing communication between the United States and the Isthmus of Panama.—*Scientific American*.

THE INFLUENCE OF FORESTS ON CLIMATE. We have frequently directed attention to the mischievous effects of the reckless cutting down of trees in France and Southern Europe, where the climate becomes every year dryer, and the soil is washed away by destructive floods, to the impoverishment of whole provinces. Warnings have long been uttered by competent observers, but in vain; a sort of rage for cutting down woods has prevailed for the last two centuries. But at length the people most interested—the inhabitants of the countries involved—have begun to open their eyes to the question, and a petition has been laid before the French Senate, which points out that the army might be employed in planting trees on the now barren hill slopes and plains. It would be something new to exercise soldiers in so peaceful and beneficial an enterprise.—*London Athenaeum*.

INSTANCES OF LONGEVITY.—A French convict was condemned at the age of eighteen years, in the year 1724, to suffer imprisonment for the term of 100 years. The convict served his time, was discharged, travelled on foot to Lyons, and laid claim to an estate that belonged to him, and in settlement therefor, he received the sum of 4,500 pounds. Donald McDonald, at the age of 107 years, was sent to the House of Correction for disorderly conduct, and afterwards, at the age of 137, came to a premature death by falling down stairs. A Russian is spoken of who lived to the age of 168 years; he married for the third time at the age of 93, and lived in the enjoyments of matrimonial bliss with his third wife, for a period of fifty years. Another case is mentioned of a man, who, at the age of 169, testified in court to an event that took place 140 years before.

AN OLD SAFE.—The old wooden safe in the bank of Marietta, the first bank in Ohio, is in possession of Mr. Lamont, of that place. Unlike safes of modern times, it is constructed of wood, with sides two inches thick, and strapped with iron bands three inches in width, into which nails are driven every three-quarters of an inch. The bands pass around the safe in both directions, and at the points of intersection are secured by nails that pass through into the wood. It was built in New York in 1807.

Vital, Physical, and Mental Phenomena.

The following is an abstract of a part of a paper by Robert Dunn, F. R. C. S., which is published in the *Transactions of the Ethnological Society of London*:

"We know nothing of life apart from an organism, and we have no evidence of mind independently of a brain and nervous system. A living organism is required for the display of the vital phenomena, and a brain of nervous system for the manifestations of mind. Life, he said, had accordingly been defined as the collective expression for a series of phenomena which take place exclusively in bodies that are organized; and mind, as the functional manifestation of the living brain. But, he it remembered, he added, that matter and the physical forces of external nature, which underlie all vital phenomena, and the changing states of consciousness, which constitute our mental life, are equally inscrutable to us. Matter and force are co-relatives and co-existent; nor can we conceive of the one, but only in association with, by, and through, the other. The correlations of the physical forces point to an unity of force; nay, lead us, as Mr. Grove thinks, to the belief that "the fundamental conceptions of matter and motion will be found sufficient to explain physical phenomena." Motion, indeed, may be regarded as a kind of common ground, upon which nature, life, and mind may be said to meet. But still the phenomena of life and mind are so antagonistic to, that they are not to be identified or confounded with, nor can they be included under, mere physical phenomena. The fact, indeed, cannot be denied that the agency of matter and the physical forces is as essential to the manifestations of life, as life itself is to the display of intelligence. Still the vital and mental forces are not to be confounded with the physical; for the truly vital phenomena—the processes of formation, growth, and multiplication—occur in living beings only; whereas the development of light, heat and electricity, whether they occur in living organisms, or in inanimate matter, are purely physical phenomena. The living germinal matter of the organism is alone the seat of vital actions; and life in its mysterious association with matter is transmitted from one living organism to another. The vital part of the impregnated egg consists of living matter, and that results from the living matter of the beings which produced it. All attempts to give vitality by means of the physical forces to inanimate matter have been vain and futile. Not the slightest approach has been made towards the formation of anything having the properties of the lowest and simplest forms of living matter. Nay, every attempt, by synthesis, at the formation of albumen or fibrine, or even of starch or the cellulose of the very lowest vegetable organisms, has been unsuccessful. Every living particle comes from a previously existing living particle.

As to mental phenomena—Mr. Dunn in considering the phenomena of mind, of which consciousness is the exponent, began by remarking, *in limine*—from the first moment that the primordial cell of a human organism comes into being, and is launched upon the ocean of time and space, the entire individual is present—an organized entity exists, fitted for a human destiny; and, from the same moment matter, life, and mind are never for an instant separated—their union constituting the essential mode of our present existence.

The mind, like the body, passes through its phases of development and growth. In the primordial cell are potentially contained the vital, nervous, and mental forces; for inherent in it are the powers of nutrition, development, under which, *in utero*, duly supplied with the nutrient pabulum, the bodily fabric is evolved and built up, in accordance with all the subsequent wants of the future man. Among others, the nervous system also, upon the vesicular matter of the encephalic ganglia of which the mind is dependent for the manifestation of all its phenomena throughout the totality of life. As soon as embryonic life is passed, the nascent consciousness becomes awakened. Our outer life begins with consciousness, and with consciousness it ends. This nascent consciousness, purely sensational at birth, emerges gradually, step by step, from self-consciousness to world-consciousness, and, through the ideational and emotional up to its highest phase of intellectual development. Consciousness itself, as the exponent of mind, is an ultimate fact in animal life, and implies mental existence. It is the universal condition of intelligence; for it is involved in every sensation which we experience, and

n every mental act which we perform in feeling, perceiving, thinking, and willing. We can best conceive of it, in relation to time, as an incalculably rapid succession of acts or states from the moment of birth, and as passing through a series of developments.

Self-consciousness is the primary condition of intelligence; and Psychology has been briefly but aptly defined—developed consciousness."

MEXICAN SILVER MINES.—R. Tredinnick, Consulting Engineer, writes to the *London Mining Journal* upon this subject. We copy a portion of his communication: Mining in Mexico is carried on in a very crude manner. Generally, whenever the water level is reached, the mines, no matter how rich and promising as regards the future, are abandoned, and others, undeveloped and requiring time to open, are taken to by the natives, who prefer the chance of discovering shallow deposits of minerals to the more laborious and expensive, though probably tenfold more profitable, explorations through the aid of machinery in deep mines. Time and experience will remedy this state of things, and probably another half century may find mining enterprise in Mexico carried on with all the improvements and aids of modern skill, the sciences, and the arts. The lodes are found at times so rich that it has been recorded that a single deposit, only 100 feet long, produced, in six months, 432,274 lbs. troy of silver, valued at 1,000,000 sterling. The great mine of La Luz, in the province of Guanaxuato, yielded annually for five years 1,000,000 profit. There are upwards of 500 mines in Mexico, and between 3,000 and 4,000 silver veins have been discovered. One of these veins, in the State of Guanaxuato, was wrought to a great depth, and yielded returns and profits of a fabulous amount, when compared with the gains accruing from other industrial pursuits. The geological character of the strata differs in several districts, and presents many curious and interesting phenomena, and especially to the practical and observant explorer of silver-producing regions. The great central plateau of Anahuac is composed of porphyry, characterized by the constant presence of hornblende, and the almost entire absence of quartz. In other places the deposits occur in syenite. In Guanaxuato—probably the richest mineral district in Mexico—the ores lie in a formation of clay-slate, while in some places they are embedded in transition limestone. The only veins worked for gold are in Oaxaca, where they traverse formations of gneiss and mica-slate. Many of the silver veins contain proportions of gold, which are separated from the silver by the well-known process in metallurgy called "parting."

JUDGE FISHER ON REISSUES.—SUSPENSION OF A GOOD RULE.—The Patent office has abrogated its recent rule in respect to suspending action upon applications for reissues for thirty days. The recent decision of Judge Fisher pronouncing this rule of the Patent Office not justifiable under the statute, may be legally correct, although we differ from him on this point.

It has never been questioned but that the Commissioner has discretionary power to adopt rules and regulations for the management of the Office not expressed in the Patent Laws, and this rule, for suspending reissues for a limited time and publishing the proposed new claims that parties interested might advance evidence to the Office showing cause why such claims should not be allowed, was one of the best and most practical that have been recently adopted. Of course the sewing-machine interest and some other large monopolies were opposed to this rule, for it prevented their slipping through broad claims unknown to the public; but all honest inventors approved of the plan of publishing claims for reissue before official action upon them, and we have never known of any detriment arising to any one in consequence, who was justly entitled to the claims asked for under a reissue. But Justice Fisher's decision sets aside this rule, and hereafter reissues cases will be acted upon immediately on their receipt, and no notice is to be taken by the examiner of testimony adverse to the applications.—*Scientific American*.

STEEL BILLIARD BALLS.—Among the new uses of steel, one of the latest, as we learn from a foreign cotemporary, is the employment of this metal in the manufacture of billiard balls, in place of ivory. Such balls are recommended for their great elasticity and their freedom from any liability of cracking.—*Scientific American*, May 26th.

Mechanical.

Testing Iron by Magnetism.

We have already spoken of Mr. Saxhy's remarkable experiments in this line, and his success in detecting flaws, with a common pocket compass, in bars of iron which were previously supposed to be homogeneous. These experiments and the conclusions therefrom derived, promise to be of very great value; for heretofore there has been no known method of making a satisfactory test of the strength of such bars, except by cutting or filing, or breaking them;—thereby producing the very defects which we wish to avoid. Mr. S. has delivered a lecture, published in the *London Artizan* for May, from which we cull some portions which will be found interesting. He assumes, as the groundwork of his system of testing, that a mass of iron is an aggregate of distinct particles, each of which has polarity; and that these particles are not (among themselves) in immediate contact. Also, that if each particle has polarity, the whole mass made up of any number of such particles is a magnet; inductively so, if pure soft iron,—permanently so, if steel or cast iron. Hence he asserts, that the old notion that magnetism exists only on the surface, is an error. He assumes also, that strength in iron is a consequence of a certain molecular condition resulting from magnetic causes. Tensile strength is but an insufficient test of what is called "goodness" in iron; inasmuch as it only indicates strength in one direction, and is not incompatible with brittleness. "Pure" iron, as used in commerce, is that which is best adapted for manufacturing purposes generally, so far as regards strength in every direction; and a test of its goodness and purity is its capability of being tied up, cold, into a compact knot. He exhibited a sample, which, when pulled into that form cold, only broke at a strain of forty-three tons to the square inch.

If we take a magnetized bar of iron or steel and divide it, we shall have two separate magnets, each having its north and south poles; further divisions of these produce smaller magnets, until our powers of further mechanical division are exhausted. Of all these magnets, the poles which point one way are north; and of course each of these is in contact with the south pole of another. This "continuity of alternate polarity" is the condition which is essential to the strength of the bar. The magnetic test is of value whether for cast or forged iron or steel. The lecture closes thus:

"A few noteworthy defects in the common mode of forging iron have been detected by the magnetic test. For instance, the upsetting of a piece of iron should always be done at as near a welding heat as possible. If otherwise done it causes flaws perceptible to the magnet; and let us here remark that many faults in condition might be remedied by annealing. As an instance: At Chatham my attention was called to the fracture of a long piece of 4-in. square iron, which was being forged out of best scrap. During manufacture it broke in two near the slings, certainly from vibration having caused it to crystallize; I believe it to have been very carefully worked and very good in quality, but the condition, had it not been broken, would doubtless have been greatly benefited by subsequent annealing.

And again, experiments have shown me that whether iron be forged in one direction or another, as regards the magnetic meridian, so will its strength vary. Hence we may reasonably question whether all testing machines should not be placed in a direction east and west, and for chain cables especially, in the iron of which we wish to avoid destruction of elasticity.

And again, in welding iron it is bad to use the ends beveled, laying pieces of filling up iron across them. This crossing of fibres, even after a sound weld, is an element of weakness, and it has been clearly proved by the magnet test to be very objectionable.

The Weight of Locomotives.

Year by year, ever since the first inception of the present railway system, the weight of locomotives has been increasing. From weighing eight, ten, or twelve tons, locomotives are now in use that weigh from forty to fifty tons, and several, recently constructed, weigh fifty-one tons each. Judging by results, it would seem that the maximum has been reached, unless a corresponding increase is made in the resisting power of rails, and a vast advance in the general character of the roadway. Under the forty-two-ton locomotives of the Erie Railway, the iron rails are crushed down and made useless or dangerous in from one month to twelve; and it is plain enough that the limit of resistance has been more than reached, and that some other material than iron must be used under the heavy modern locomotive. Whether that material is simple steel, or steel and iron mixed, remains to be decided. Ample experiments have shown that a well made steel rail, besides presenting a better wearing surface, has nearly double the stiffness of iron, section for section, to resist the deflection caused by the weight of the driving-wheels; and as stiffness, or resistance to deflection, is one of the main points to be secured, this element goes a great way in favor of using steel rails. Eminent railway managers and engineers favor the continued use of iron, but insist upon a multiplication of cross-ties, reducing the space between the centers of the ties from thirty inches to twenty inches, or laying them as close to each other as is possible, only allowing room enough between them for tamping; and this may be well enough on roads that have moderate weight of equipment, but on roads with engines weighing forty or fifty tons, it is proved over and over again that iron rails cannot resist the crushing weight. At every point where the rail touches the sleeper, the effect of the blow of the driver is plainly seen, and though a multiplication of cross-ties might mitigate the effects, yet the partial remedy is an expensive one, because the wooden superstructure rapidly deteriorates from climatic effects when assisted by this heavy hammering. If the exigencies of business would allow of it, and managers would be satisfied with a reduction in the weight of engines down to twenty-five or twenty-eight tons, and a reduction in speed, iron rails properly manufactured might be continued in use; but as the general tendency is to an increase in weight of engines, and an increase in speed, the rail question, on lines crowded with business, has but one settlement: the strongest and stiffest rail must be used, and that material is steel.—*American Railway Times*.

THE PROPER FORM FOR STEAM BOILERS.

The following is condensed from an article in *The Engineer*: In designing boilers of any type, it should never be forgotten that the great secret of the economical generation of steam lies in breaking up the gas current as much as possible, and throwing it into eddies and whirls by obstacles placed in its way. In theory, this can be done by causing the flame and smoke to ascend through a box filled with small horizontal tubes containing the water. Such boilers have been tried, but not found to work well, because the circulation of the water could not be properly maintained. Although found to be economical in fuel, they were found liable also to rapid deterioration by use. Vertical water tubes answer far better, provided proper precautions are taken to maintain free water circulation within them. The area of the exit should be contracted so as to compel the gases to fill all the depth of the flue; otherwise they will rise toward the upper ends of the water tubes, which are usually filled with foam not well calculated to absorb heat. It cannot be said that this expedient has been found quite satisfactory; and it is certain that a thoroughly good boiler with vertical water tubes transverse to the direction of the current has yet to be produced. There are several such generators in use, however, which although not quite perfect, are more nearly so as steam generators than any fire-tube boilers in existence.

LOCOMOTIVES.—Of six new locomotives built or building for the Great Western Railway Company, the exterior of the boiler is made entirely of steel, the furnace or fire-box is made of copper three-quarters and half an inch in thickness, and all the axles are steel, as are also the tires of the wheels.

Scientific Miscellany.

Lignites of the West.

The following is condensed from an abstract of F. V. Hayden's forthcoming report of the United States Geological Survey of Nebraska, published in the *American Journal of Science and Arts*. The lignite beds of the Laramie Plains are from five to eleven feet thick, and occupy a basin estimated at 5,000 square miles. The product is of excellent quality, is non-bituminous, and contains seams of jet which resemble cannel coal. It answers at least quite as well for fuel as any wood. There is an abundance of iron ore in the vicinity, and the Union Pacific Railroad Company will probably establish rolling-mills at no distant period. The Marshall Mines, at South Boulder Creek, are probably the most valuable in the West. They have been worked for four or five years. Fifty tons of this lignite is sold at Denver, daily. There are eleven beds, each from three to thirteen feet thick, making a total thickness of from thirty to fifty feet of solid lignite. There is another bed twenty miles south of Cheyenne City, of excellent quality. The summit of the hills near this bed of lignite is covered with loose oyster shells, and there must have been a thickness of four feet or more almost entirely composed of them. The species seems to be identical with the one found in a similar geological position in the lower lignite beds of the Upper Missouri, near Fort Clark, and at the mouth of the Judith River, and doubtless was an inhabitant of the brackish waters which must have existed about the dawn of the Tertiary period in the West. These lignite beds are exposed in many localities all along the eastern base of the mountains. According to the exploration of Dr. J. L. Le Conte during the past season, these same lignite formations extend far southward into New Mexico, on both sides of the Rocky Mountains.

Specimens from the Marshall mines were found to contain 59 per cent. of fixed carbon. This shows its superiority over lignites found elsewhere. Mr. Hayden came to the conclusion that it would prove to be better than ordinary Western bituminous coals, and rank next to anthracite for domestic purposes. Being non-bituminous, it will require a strong draft to burn well. It is as neat as anthracite, leaving no stain on the fingers. It produces no offensive gas or odor, and is thus superior in a sanitary point of view, and when brought into general use it will be a great favorite for culinary purposes. It contains no destructive elements, leaves very little ash, no clinkers, and produces no more erosive effects on stoves, grates, or steam boilers, than dry wood. If exposed in the open air it is apt to crumble, but if protected it receives no special injury. The connection of the lignite deposits on the Upper Missouri has been traced uninterruptedly to the North Platte, about 80 miles above Fort Laramie. The geological age of these Western lignites is undoubtedly Tertiary. Prof. Lesquereux has furnished valuable notes as the result of his preliminary examination of the fossil plants in the lignite deposits, which confirm this view of their age. Mr. Hayden says all evidence seems to indicate that there are no valuable beds of lignite west of the Mississippi in formations older than the Tertiary; and that all the lignite tertiary beds of the West are but fragments of one great basin, interrupted here and there by the upheaval of mountain chains, or concealed by the deposition of newer formations.

BUTYRIC ACID IN GLYCERINE.—Glycerine separated from most fats is contaminated with butyric acid. Its presence, according to H. Perutz, may be easily recognized by distilling the glycerine with some sulphuric acid and alcohol, by which means butyric ether will be obtained and at once identified by the pineapple odor. On the large scale, the butyric acid may be separated by filtering the glycerine through animal charcoal. The acid will be retained in combination with lime, and the butyrate of lime may afterwards be extracted by alcohol, and the solution, on distillation with sulphuric acid, will give pineapple essence in commercial quantities at a cheap rate; or the butyrate of lime may be decomposed by the addition of oxalic acid, and the butyric acid purified by distillation.

IRON IN VARIEGATED STRATA.—At a recent meeting of the Geological Society of London, reported by the *Colliery Guardian*, a paper upon this subject was read by Geo. Maw, Esq., F. G. S. The conclusions at which the author had arrived were the following:

That the assumed production of the coloring matter of red beds from the decomposition of iron pyrites appears untenable. (2) That the bleaching of red beds by the reducing action of fossil carbonaceous matter will not account for the facts of variegation. (3) That this bleaching and nearly every form of variegation of red beds are caused by the passage of iron from the discolored areas unaccompanied by any change of combination, excepting the invariable conversion of the anhydrous into the hydrated peroxide. (4) That the arrangement of the iron has not been produced by solution. (5) That it has in some cases been produced by a variety of evident conditions independent of mere chemical reaction, while in other cases it seems to have occurred arbitrarily. (6) That it is unaccompanied by any other change in the combination or position of the constituents of the stratum, and appears to be wholly independent of its chemical constitution, any simple chemical theory being, in short, insufficient to account for the movement of the iron. (7) That the motion has sometimes taken place centripetally and sometimes centrifugally. (8) That the partial conversion of the carbonate of protoxide of iron into hydrated peroxide is one of the most frequent purely chemical causes of variegation. Other causes are the conversion of the red anhydrous into the yellow hydrated peroxide; the secondary formation of the disulphide and the several stages of its decomposition in mechanical association with the peroxide; and, lastly, the infiltration of limo and magnesia into red beds. (9) That some of the more complicated forms are due partly to segregation and partly to changes of combination. (10) That the ferruginous banding of yellow sandstones is the result of the segregation of the hydrous peroxide of iron into lines which are invariably adjacent to a bleached part of the stratum over which they appear to have advanced, gathering up the peroxide of iron in their course, and leaving behind them a depleted area.

COLORING OF ZINC PLATES.—The *Annual of Scientific Discovery* for 1868 has the following: A variety of beautiful colors, corresponding to those of the rainbow, can be imparted to zinc surfaces by a simple chemical application continued a length of time proper for the desired color. It is necessary that the metal be pure, and especially free from lead. It is therefore to be rubbed with silicious sand moistened with hydrochloric acid, then dipped in water and rubbed vigorously with blotting paper. The zinc is then immersed in a solution of 3 parts by weight of dry tartrate of copper in 4 parts caustic soda, with 48 parts distilled water, the whole at a temperature of about 50° Fah. The colors will appear successively, in the prismatic order, according to the period of immersion. In two minutes the violet will appear; in three, dark blue; in four and a-half, a dark yellow; in eight and a-half, a red purple. Intermediate terms give intermediate tints. When colored, the zinc is well washed with water, and for greater permanence of color may be varnished.

COTTON WAX.—Mr. E. Schunck, in a paper read before the Manchester Literary and Philosophical Society, "on some of the constituents of cotton fiber," describes the organic substances obtained by him from unspun cotton yarn, the most interesting of which was a waxy matter, insoluble in water, but soluble in ether and alcohol. If a concentrated solution in boiling alcohol be allowed to cool, the greatest part is deposited, causing the liquid to assume the appearance of a thick white jelly, consisting of microscopic needles or scales. When this jelly is filtered off and dried it shrinks very much, and is converted into a coherent cake, which has a waxy luster, and is translucent, friable, and lighter than water. Its melting point is between 83° and 84° C. At a higher temperature it is volatilized. When heated on platinum it burns with a bright flame. The author thinks it probable that this substance covers the cotton fibers with a thin waxy film, and this imparts to them their well known property of resisting water. In its properties and composition it approaches very nearly the vegetable waxes, such as those found on the leaves of the sugar cane and of the carnauba palm. He proposed the name of cotton wax, to distinguish it from the other nearly allied bodies.

New Patents and Inventions.

Under this heading we shall mention, from week to week as occasion may demand New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

List of patents issued from the United States Patent Office for the Pacific Coast and Territories for the week ending May 19th, 1868, which will be further noticed hereafter:

IMPROVEMENT IN PARLOR SKATES.—Robert Hewson, San Francisco, Cal.

IMPROVED EXPLOSIVE COMPOUND.—Alfred Nobel, of Hamburg, Germany, assignor to Julius Bandmann, San Francisco, Cal.

IMPROVEMENT IN BOOTS AND SHOES.—Nicholas Lumsden, San Francisco, Cal.

IMPROVED METHOD OF MOUNTING THE CUTTERS OF ROTARY PLOWS.—Philander H. Standish, of Martinez, Cal.

IMPROVED OINTMENT.—Henrietta T. Wood, San Francisco, Cal.

DESTON.—FOR A WATER CLOSET RECEIVER. Wm. Smith, San Francisco, Cal.

NOTICES OF PATENTS RECENTLY ISSUED.

77,787.—IMPROVED TRUNK LID SUPPORTER. Samuel Wehrly, San Francisco, Cal.:

1. I claim the spring B, having a hole *a*, near its upper end for the purpose of receiving the point D, substantially as described.

2. The catch E, having a point D, formed by making a slot on its top, substantially as and for the purposes described.

The objection of this invention is to provide a convenient supporter for trunk and other hinged lids, so constructed that it will not interfere with the general arrangement of the trunk or other receptacle on which it may be placed, and which will serve to prevent the lid, when open, from falling, and thereby injuring or inconveniencing any person who may be engaged at the trunk. To accomplish this the inventor employs a spring, made of any thin piece of metal, long enough to reach from near the center of the back side of the trunk to an inch or so above its top. This spring is fastened to the back of the trunk, near the center, and has in the end which extends above the trunk a hole pierced sufficiently large to admit a catch. This catch is composed of a piece of metal, fastened to the back side of the lid, just above the spring, having one end projecting towards the top of the spring, and entering the hole where the trunk is open. A slot in the end of the catch engages the spring, and prevents the lid from falling either forward or backward. This device is simple, automatic in its action, and perfectly reliable. The trunk lid is secured from falling by the simple raising of it to a perpendicular position. All that is necessary in closing it is to use a slightly greater amount of force than is usually required in bringing down the lid from its perpendicular position.

78,080.—IMPROVEMENT IN CULTIVATORS.—Henry A. Gaston, Stockton, Cal.:

I claim, in combination with an inclined reversible bit for a cultivator, the method of securing such bit to its standard, substantially as described.

I also claim the combination of the series of bits (so applied to their vertical standards) with the cultivator frame or carriage, substantially as described.

78,089.—IMPROVED CONCENTRATOR.—Joshua Hendy, San Francisco, Cal.:

1. I claim the annular groove I, declining from a certain point to an opposite or discharging point in combination with a vibrating or oscillating pan or concentrator whose surface is convex or curvilinear as described.

2. The discharge valve or gate M, when constructed and arranged to operate substantially as described.

3. The T shaped distributors K, K, pierced with holes b, b, b, and having slots b', b', said distributors being either stationary or movable, and when movable the notched edge c, c, c, with pawls or their equivalents d, d, d, operating therein for driving the said distributors substantially as and for the purpose described.

4. The agitators or stirrers a, a, a, attached to stationary or movable radial arms I', I', or their equivalents with an oscillating pan as described.

5. The peculiar construction of the frame A, A, it being triangular in form, the pro-

jecting ends B, B, for the crank shaft, the point A', in combination with an oscillating pan, substantially as described.

6. The overreaching supports or braces F, F, connecting at the point F', and in which the upper end of the vertical shaft turns in combination with the frame A, A, with the projecting ends B, B, and oscillating pan substantially as described.

7. The peculiar construction of the ball-crank pin N', when employed on an oscillating pan, substantially as described.

8. The oil groove H, either in the hub of the pan on the shaft G, and the oil cavity T, above the hopper for lubricating the sleeve and step with an oscillating pan substantially as described.

This invention is an improvement on the present well known Hendy Concentrator, and consists in constructing the pan with a groove around the inner periphery, which gradually declines from a given point to the opposite or discharging point; it also relates to a distributor or distributors and stirrers, which are operated by the same power that moves the pan, and through which the pulp passes into the pan, the heavier particles settling in the annular groove, displacing the lighter particles of sand by their gravity, and the centrifugal force, while the current of water and the sand and debris tend towards the center discharge opening, as in the pan as heretofore constructed. This improvement also comprises a self-discharging apparatus, and the peculiar construction of the crank-pin attachment, which accommodates itself to the circular line of the oscillators of the pan. The construction and disposition of the frame and braces to a pan of this construction, are such that much strength is obtained with less amount of material, rendering the machine more easily transportable to remote districts; the frame and supports are also out of the way of the movements of the pan and operators. The claims rehearsed above will give the reader some idea of the extent of the improvements secured by this patent.

78,093.—IMPROVED MACHINE FOR POLISHING WOOD.—Henry O. Hooper, Diamond Springs, Cal.

I claim the circular rotary polishing plates E, and the reciprocating polishing plates H, arranged with and attached to the adjustable framing B', all constructed to operate as described for the purpose specified.

78,111.—IMPROVEMENT IN GANO PLOWS.—Geo. W. Manuel, San Francisco, Cal.:

I claim the arrangement of the crank-arms d, e, f, under the hounds or bars, and in their relation thereto as and for the purposes set forth.

2. In a gang plow having a series of plows arranged on bars or hounds parallel to each other, I claim placing the one plow on the bar g, outside of the wheel a, and in front of the axle, as and for the purposes recited.

3. The combination of the extended crank arms d, and e, with the lever l, and curved bar o, as and for the purposes herein set forth.

4. The crank screw r, and plates s and t, for elevating and depressing the tongue as described.

78,141.—IMPROVEMENT IN TIRE TIGHTENER. Silas Shirley, Santa Clara, Cal.:

I claim, in the tip B, having sockets for the felloes, the covers F, F, substantially as and for the purpose herein described.

This improvement consists in an improved device for regulating the set of wagon tires, so that they can be easily made to fit closely when the wheel becomes dry, or they may be slackened, if so tight as to warp and alter the shape of the wheel, the whole work being easily done by the teamster without either taking off or cutting the tire. This is accomplished by placing upon the end of one of the spokes a metal tip or hollow block, which is shaped so as to conform to the outline of the spoke and not mar the symmetry of the wheel. This tip admits at each end, in the direction of the circumference of the wheel, the ends of the adjoining felloes, where they are firmly held in a socket. Within this tip is placed a right and left screw, so adjusted that it may be operated in such a manner as to spread or contract the tip, as it is turned one way or the other. If the tire "blows," the tip can be readily contracted

so as to reduce the circumference of the felloes to properly fit the diameter of the tire. Again, if the wheel shrinks so as to render the tire loose, the screw is turned in the opposite direction and the circumference of the wheel enlarged, so as to fit closely to the tire. The device is so constructed as to be readily operated, without in any way injuring the symmetry of the wheel.

78,317.—IMPROVED EXPLOSIVE COMPOUND. Alfred Nobel, Hamburg, Germany, assignor to Julius Bandmann, San Francisco, Cal.:

I claim the composition of matter made substantially of the ingredients and in the manner and for the purposes set forth.

78,400.—IMPROVED METHOD OF MOUNTING THE CUTTERS OF ROTARY PLOWS.—P. H. Standish, Martinez, Cal., assignor to himself and O. C. Coffin.

1. I claim the revolving hubs, E, E, and the supporters, F, F, constructed and operating substantially as and for the purpose described.

2. I claim a flexible or yielding arm, having the spring G, or its equivalent, together with the rotary-cutter, substantially as and for the purpose described.

This invention relates to an improvement of the Standish steam plow, but is applicable as well to all rotary plows. It consists of an improved method of mounting the rotating knives or cutters so that the plow can be more readily operated in rough or stony land without breaking them. This is accomplished by making the cutters flexible, or yielding. For this purpose a number of arms are attached to the bottom of a vertical driving-shaft, these arms turning on a horizontal plane. At the extremities of these arms are attached stout hubs of iron, turning on horizontal axes. Through these hubs the cutters pass vertically, and in soil which contains but few stones they are held by a supporting-piece of cast iron, which is strong enough for ordinary work, but which breaks off if the cutter strikes a stone—thus allowing the hub to revolve backward until the cutter has passed over the stone, when a new support is attached. If the land is very stony, the cutter is mounted upon a hub in the same manner, but is held in place by a spring sufficiently stiff to keep it to its work in the soil, but which will allow it to turn back by contact with a stone.

78,409.—IMPROVED OINTMENT.—Henrietta T. Wood, San Francisco, Cal.:

I claim the above described composition for ointment, made of the ingredients enumerated, mixed or compounded, in about the proportions specified.

The object of this invention is to provide an improved ointment for cuts, wounds, bruises, burns, chapped hands, etc. This ointment has been prepared by the patentee, and used by her in medical practice, with much success, for several years.

THE YOSEMITE GRANT.—This valuable gift to California is, after all, not likely to be turned over to private individuals. Even if the Commissioners had not made their protest to Congress, that body would not have confirmed the action of the Legislature, because the proper forms were not observed throughout. It now appears that, although the bill was passed over the Governor's veto by both houses, it was never afterwards sent to the Secretary of State, as the law requires, with the certificates of the presiding officers to the fact that it had so passed by the requisite number of votes. "Somebody blundered" here, as the *Bulletin* says, to good effect; and the next Legislature will probably settle with those who have been in good faith occupying the land, by an appropriation of money.

IMMIGRATION FROM THE COTTON STATES. The steamer which arrived on Saturday last brought three gentlemen from the Southern States, who have been deputed by associations of persons desiring to settle on the Pacific Coast, to report upon the advantages offered by California for such settlement. They will first visit the southern counties. An Oakland gentleman, formerly a resident of the South, has received a letter from his old home, stating that at least twenty thousand people will leave for California during the present year.

A 6,000-POUNDER CANNON.—An English inventor has recently patented an enormous gun of 32-inch bore, and capable of throwing a 6,000-pound shot! The bore of this monster gun is 30 feet in length. Of course, such a gun could not be fired with powder, as the initial force required to overcome the inertia of such a heavy ball would be entirely beyond the power of resistance which the metal of the gun could offer. To obviate this difficulty, the inventor constructs his monster cannon on the principle of the air-gun. He proposes to condense his air to a density which will be equivalent to a pressure of 10,000 pounds to the inch. The chamber, instead of being placed in the rear of the ball, is contained in a large casing or jacket formed around nearly the entire length of the bore of the gun, and the valves by which it is admitted to the bore are operated by the ball itself during its exit. The gun is discharged by pumping a small quantity of high-pressure air into the rear of the ball, just enough to start it past the first port, when the stored-up air does the rest of the work. The initial force of 10,000 pounds pressure is gradually diminished to 5,000 at the moment of the exit of the ball, which is equivalent to driving the ball at a rate of about 13,000 ft. per second, which is a little under the velocity required in the usual ordnance. *Engineering*, in alluding to the invention, says: "Although there may be certain practical difficulties in carrying out the scheme, it promises great interest, and we shall look with much curiosity to its practical realization."

EARTHQUAKE WAVES.—The late convulsions at the Sandwich Islands were preceded by an earthquake wave, which made itself felt on this coast, and was duly recorded on the Government self-registering tide-gauges at San Diego and Astoria, as well as in this city, in about five hours' time. In 1854, such a wave was transmitted from Japan in about twelve and a half hours. The rate in each case was therefore about four hundred miles per hour.

PHOTOGRAPHING THE INTERIOR OF A TUNNEL.—Mr. Evans has presented to the New York Institute of Engineers, a photograph of the high level tunnel of the Central Pacific Railroad. The east end of the tunnel being sometimes illuminated at sunrise, a large mirror was employed to reflect the sun's rays equally over the whole of the interior, while the picture was being photographed. The plate having been exposed about fifteen minutes, a print was taken showing every detail, even to the timbering of the drifted headings, with great distinctness and accuracy.

PROF. CHAS. S. PAGE.—This gentleman, who has been for many years connected with the U. S. Patent Office, in the capacity of chief examiner of philosophical instruments, died on May 5th. He was the inventor of an electro-magnetic motive-power engine, which attracted some attention twenty years ago. He made important discoveries in electro-magnetism.

A NEW LETTER-PRESS COPY-BOOK has appeared in Philadelphia, with which a copy of a manuscript may be taken by merely placing it under a leaf and passing the hand over it. The ink used has a certain chemical relation to the paper of the book. No press, no brush, no water, and no patience are necessary.

If any of our readers overlooked the card of the Women's Coöperative Union, in our last issue, they will do well to look it up, but better still to call at the store, No. 39 Second street, and take a look at the goods.

TO CLEAN A BRASS CLOCK.—Boil it whole. The water used should be pure rain-water. Dry on a warm stove to prevent subsequent rusting. This plan saves trouble, and works well when the only trouble is accumulated dirt, or thickened oil.

Fluctuations in Leading Mining Shares for the past Six Months.

NEW INCORPORATIONS.—Articles of incorporation have been recently filed in the County Clerk's office in this city as follows:

ALTA SQUARE HOMESTEAD ASSOCIATION. June 16th. Capital Stock, \$23,100; 44 shares, \$525 each. Trustees: G. S. Ladd, A. J. Jeghers, Charles Reading, Charles E. Gibbs, and T. B. Wilde.

NEVADA CONS. B. G. Co.—June 16. Capital Stock, \$925,000; 18,500 shares, \$50 each. Trustees: J. S. Silver, Jas. P. Dean, P. C. Lander, Geo. Hearst, and Fred. McCrellish.

EUREKA G. M. Co.—June 17. Capital Stock, \$1,200,000; 4,000 shares, \$300 each. Trustees: W. Watt, A. J. Pope, G. W. Beaver, M. Buckley, and A. E. Head.

ELECTION OF OFFICERS.—Yosemite Consolidated M. Co.—June 9th. Trustees, R. L. Bampton, Peter Bradow, Robert Stuart, Wm. K. Squires; President, R. L. Bampton; Secretary and Treasurer, David Wilder; Superintendent, Peter Bradow.

ENTERPRISE G. & S. M. Co.—June 3d. Trustees: A. DeLand, E. B. Mott, Jr., H. Pomeroy, James Paul, and Wm. P. May. President, A. DeLand; Secretary, Wm. P. May; Treasurer, E. B. Mott, Jr.

SANTA CATALINA.—James Lick, of San Francisco has been confirmed in his possession of the island of Santa Catalina.

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, June 20, 1893.

CITY STOCKS.

In miscellaneous stocks little has been done during the past week. Sales of Pacific Bank stock have been made at 95@97 1/2 per cent.; Pacific Insurances at \$120; Central Railroad at \$50, and North Beach and Mission Railroad at \$64@64 50. The California Steam Navigation Company paid its usual monthly dividend on the 15th inst. The annual meeting of the Omnibus Railroad Company will be held on the 6th day of July next. At this close, San Francisco Gas sold at \$80.

We learn that the receipts of the San Francisco and Oakland Railroad Company during the month of May amounted to \$23,227 against \$12,430 same time in 1892. This is a very marked increase in one year, and fully proves the rapid strides Oakland has made within that period. There is a constant increase of population to Oakland from this city of persons in business here, who make the trip every day, and with improved facilities, such as shortening the passage, etc., family residences across the bay will be still more desirable by our mercantile community.

Mining Share Market.

Since our previous review of the mining share market, the depression has been carried to a still lower point, and as a general thing the market lacks vitality. The present condition of some of the mines does not seem to warrant the prices at which they have been held, and in their fall is involved the recession of others which have more intrinsic value, and fairer future prospects. It seems that most dealers in stocks look too much to the prospective value of claims instead of basing their calculations upon the present and better understood worth of their investments. In this view some stocks have commanded prices far above their real value. The delay of favorable developments in the lower levels of the several claims has more than anything else tended to hasten the decline, and until such developments are made we cannot look for a very buoyant market. As a rule, though, when stocks are down outside dealers stand aloof, and when they rise—even when they have reached largely inflated prices—the desire to invest seems to be strongest. These extremes produce the disastrous effects in our stock market. The diversion of capital to other channels of investment also adds its influence to produce the prevailing apathy. At the close, a somewhat better feeling prevails.

SAVAGE—has been moderately active, improving from \$148 50 to \$156 50, dropping to \$146, and at the close selling at \$153. During the week ending June 15th, 1,730 tons of ore were extracted, showing an average assay value of \$49 90 per ton; previous week, the product amounted to 1,768 tons, valued at \$47 24 per ton. The south mine, on the fourth station, for the week under review, contributed 1,117 tons, and the ore on the fifth, sixth and seventh floors in this locality is more abundant than was supposed, the average value of the third-class ore having improved over the product of previous weeks. A west cross-cut on the sill floor, about sixty feet from the south line, has developed three feet of good ore, the same being about twelve feet west of the main body. The south drift from the fifth station is reported to continue in good ore, and at the foot of winze the breasts are said to open out well. The work of retimbering the shaft below the fifth station progresses well, and does not interfere with the production of the mine, only causing delay in opening the sixth station. Receipts of bullion to date for June account foot up \$124,600.

IMPERIAL—has been somewhat more active than the previous week, and experienced a material decline, falling from \$204 to \$145, and at the close realizing \$162. The operations in the lower drift show a progress of twelve feet in the vein matter up to the 16th inst., and in which some traces of silver are found. It is thought that they will have to run some twenty feet further to find ore, and probably will have to raise toward the 700 level for that purpose. The Alta shaft is now being repaired below the 400 level, preparatory to sinking winze in the vein from the 700 level. It is very much out of repair, and it will take a month's work before they can hoist through it. The prospects for an average yield of bullion the present month are very fair. On the morning of the 19th inst., the drift presented a more favorable appearance, having advanced five feet within the previous twenty-four hours, and showing seams of ore in the face. A dividend of \$6 per share is payable to-day. The annual meeting of stockholders takes place on Tuesday, the 30th inst. The shipment of bullion to date for June reach \$22,961 68.

CROWN POINT—was less active, selling at \$103 50@107, declining to \$97 50, and at the close selling at \$99 50. The south drift on the 800 level is now upwards of 170 feet from the Kentuck line, showing five feet of ore in the face. Above the 800 level the floors are looking well. This winze from 800 level is down some eighteen feet, and the whole area is said to be in excellent ore. There is also a noticeable improvement in the middle and west bodies on the sixth and seventh levels, and from these localities they expect to obtain an increased supply of ore. The receipts of bullion to date, for the current month, aggregate \$41,026 27. The \$18,000 stated in our last issue to have been received by the Kentuck Company should have been credited to this company. A late dispatch says this winze from 800 level shows five feet of \$40 ore at the bottom. Shaft is eighty feet in depth below 800 level.

KENTUCK—met with the usual sales, opening at \$365@370, declining to \$350, and closing at \$375. The usual amount of ore continues to be taken from this mine. Work on the shaft progresses slowly. Receipts of bullion to date, for the current month, amount to \$35,012 06. **GOLD HILL QUARTZ** sold at \$107 50@85, and closed at \$82. The 450 level is said to yield a better quality of ore, but not so large a quantity. The first bullion returns for June amounted to \$2,918 16, and they usually have four clean-ups in a month.

HALE & NORCROSS—experienced a serious decline within the past week, selling from \$117 50 to \$57 50, and at the close selling at \$70 50. On the 18th inst., they had penetrated the ledge some six feet, and passed through two feet of ore, which is not considered encouraging; however, beyond this they may strike it in large and paying quantities. **CONFIDENCE** is dull of sale. Our quotations are \$30 bid and \$40 asked. On the 13th inst., \$44 15 in bullion was sent forward, being the product of 200 tons of ore. They extract about fifteen tons of ore per day.

AMADOR—was in the market at \$245@265. The first run for the present month shows a bullion product of about \$24,000, of which only twenty tons were Badger rock. The Badger shaft has been increased in depth upwards of seventy feet, and reveals a very fine ledge.

CHOLLAR-POTOSI—declined from \$283 to \$220, and closed at \$247. Commenced opening the seventh station on the 8th of June. The incline is 271 feet in depth, and 1,121 1/2 feet—perpendicular measurement. During week ending June 12th, extracted 652 tons from the Blue Wing section; 600 1/2 tons were sent to custom mills during the same period. Nothing of importance from the mine. **ORION** sold at \$14@12, and closed at \$12 1/2. The new shaft is timbered to the depth of 297 feet. An assessment of \$4 per share was levied on the 15th inst. The Bacon Mill and Mining Company declared a dividend of \$2 per share, payable since the 19th inst.

COLE (VA.)—This stock sold at \$40@25, and closed at \$32. In the 200-foot tunnel, carried in some years ago, at a point 120 feet from the surface, they have found a vein four feet wide, in which they have sunk some seven feet. They have extracted some very rich ore lately, and have some fifteen tons that will mill, according to assay, \$500 to the ton. Will commence hauling ore to the mill on the 22d. The dump contains about 200 tons of pay ore.

The sales in the Board during the past week have been as follows: Regular, 266,455; open sessions, \$477,920—Total, \$2,164,405, against \$2,421,888 in the previous week.

WOODWARD'S GARDENS.—Notwithstanding the numerous picnics to rural regions, by rail and steamer, large numbers are drawn to Woodward's Gardens by the great attractions afforded. In addition to the varied natural beauties, curiosities, animals and artistic works, this garden affords rustic retreats and sylvan bowers, to be found in no other place about San Francisco. Photographic Rocks still on exhibition. *Sunday Mercury.*

ALL the diamond cutting in this country is done by one firm in Boston, and their business is confined to the re-cutting of stones which have been nicked or otherwise rendered imperfect.

Work upon the Mechanics' Fair Building is progressing rapidly. The side and rear walls are up, and quite a number of the arches designed for supporting the roof are already in place.

MINING SHAREHOLDERS' DIRECTORY.

[Compiled for every issue, from advertisements in the MINING AND SCIENTIFIC PRESS and other San Francisco Journals.]

Comprising the Names of Companies, District or County of Location; Amount and date of Assessment; Date of Meeting of Shareholders; and Amount and Date of Payment of Dividends.

NAME, LOCATION, AMOUNT, AND DATE OF ASSESSMENT.	DAY OF DELINQUENCY.	DAY OF ASSESSMENT.

Mining Summary.

THE following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

Alpine County.

Miner, June 6th: The Pittsburg Co. now have good air throughout the works.

The Schenectady Co. are trying to effect a raise of \$80,000 to place them in condition to work the mine and erect reduction works.

The Rippon Co. are encountering some good looking quartz, having struck several small veins. The prospect for a ledge was never better.

An additional force is being worked on the L. X. L. mine. They now have a pay vein of nearly five feet, and are taking out more good ore than at any time heretofore.

In the Morning Star, a drift south from the cross cut on the lower level has opened the finest body of ore yet found.

Chronicle, June 6th: Some two years ago furnaces were erected at the Pioneer Quartz Mill, Markleville, for working by the Rivot process. We learn that two French gentlemen are coming here to give it another trial.

Amador County.

Ledger, June 13th: R. K. McCoy and W. F. Keeney made a faithful search for a traditional rich lead running through Neely's ranch. When out of pocket and nearly exhausted, they "struck it." The first run cleaned up a little less than an ounce a day to the hand, with promise of better to come. Mitchell & Co. have the first south extension of the above. The White claims at Pine Grove, have yielded over \$3,000 up to this time.

The new furnace for sulphurets, at the Coney & Bigelow mine, is rapidly approaching completion. Its capacity is much greater than the old one.

Calaveras County.

San Andreas Register, June 13th: Letter from Copperhead Flat: Smith & McNair's large vein is running day and night, driving one arastra, and crushing from 1,600 pounds to 2,000 pounds every 24 hours. They have another arastra about completed. Ferguson has commenced sinking a new shaft near the eastern boundary of his claim. Billy Smith is driving his tunnel ahead in the Lodi, and taking out some very rich rock. The company have hired a couple of men to sink a shaft to connect with the tunnel. The Central mine, owned by Bean & Lampson, is to commence sinking in a short time. If the rock continues to look as well as it does now, they will never let up. Bean is running his arastra.

Chronicle, June 13th: The Coffee-mill claim, bids fair to turn out good. The company have run a drift several hundred feet through pay dirt. Paul & Co. are driving work upon their mine with spirit. Bates & Co. have a promising looking claim. The dirt prospects well. Bracket & Co. are running a tunnel across the channel to the back rim rock. At present they have but few hands employed, but will increase the force so soon as their tunnel is completed. Markwood & Co. are doing a paying business with their hydraulic in the old Gopher claim.

Smith & Co. have struck a vein of quartz in an abandoned tunnel, in Poor Man's Gulch, from 4½ to six feet in thickness, which prospects well.

We learn from Railroad Flat, that a Mexican struck some rich rock in a ledge one-fourth of a mile from Independence, a few days since.

A company have been prospecting a ledge on the outskirts of the village, by a shaft, which is now about 25 feet deep. At this depth they have a vein, showing quartz that will pay from \$20 to \$60 per ton.

Inyo County.

Gold Hill News, June 8th: In Cerro Gordo District, Alexander Kennedy and others have purchased a large interest in the San Ignacio mine for \$16,000, and are now taking measures to develop it. Charley Duval, from Cerro Gordo, will return in a week with the castings for two first-class furnaces for the Independence mine.

Same of 10th: Charley Hill, foreman of the Kearsarge, has been running a tunnel, cutting the ledge 1,000 feet below the croppings, at which point the vein is between three and four feet. The mill will be put to work shortly. Almarin B. Paul is erecting two roasting furnaces at the Silver Sprout mill, and as soon as the ore can be transported from the mine, will be set at work. The ore is abundant, of a rich quality. The Lafayette mine is also in a prosperous condition, with plenty of good ore out. The company propose milling a quantity of it soon. In Alabama district, some eight or ten miles south of Kearsarge, on the same

side of Owen's River Valley, Thomas Passmore and Wm. Lake have discovered good placer gulch diggings, which yield \$10 a day to the hand. The gold is very fine, being worth \$17 50 per ounce, but the diggings are "spotted."

Mr. Nathaniel Page is on his way to inspect the Kearsarge mine, and start the mill.

Nevada County.

Gazette, June 10th: The "Jim" ledge, located on Little Cañon Creek, near the South Yuba, has a tunnel running upwards into the sidehill, giving fall enough to dispense with pumping or hoisting machinery. The mill has a single battery of six stamps, crushing about ten tons of rock per day. The ledge is over five feet wide.

Same of 12th: We, yesterday, walked out to the Canada Hill sulphuret works, recently erected to work ores by the Rivot process. The furnaces have not yet begun to roast ores, but everything will be ready in six weeks.

16th: The Union Hill mine recently took out a quantity of rock estimated at \$5,000 within a few hours, and seventeen loads of rock from the "7-30" ledge, as we are informed by the Grass Valley Union, yielded \$2,700.

Transcript, June 11th: The Gold Bluff Mining Company sold, on the 4th day of June, their claims on Manzanita Hill, for \$160,000, gold coin.

Work has been resumed on the Mohawk mine, Gold Flat. Mr. Barber is moving the machinery to the bottom of the hill, from which point he will sink an incline.

Holmes, Weston & Co., whose hydraulic claims are at Gopher Point, four miles from this city, have nearly completed their arrangements for a blast of two hundred and twenty-five kegs of gunpowder. They have run a tunnel sixty feet, at the end of which is a cross drift of fifty feet.

A few days since, a vein of quartz was struck on the grade above the Yuba bridge, which promises well. On the surface it was but a small seam, but at the depth of three feet it had become a well defined ledge five inches thick. The rock prospects well.

Grass Valley Union, June 11th: The North Star Company shipped, on Tuesday, \$12,000, after a ten days' run. The Empire mine was yielding magnificent rock on Tuesday. The specimens brought in are among the richest ever seen in Grass Valley. The gold is in beautiful layers all through the rock.

Same of 13th: The Edmonton claims, near the North Star Company's mine, were lately sold to the latter company for the sum of \$30,000. The whole cost of the Edmonton claims to those who recently sold them would not foot up to over \$800.

The report has been current for several days that the Empire mine's pumping machinery had broken down, and that the shafts were filling with water. Yesterday, the damage was repaired by replacing the cracked wheel with a new one, and work went ahead as usual.

The Domesday was taking out yesterday magnificent rock.

Grass Valley National, June 10th: At Delano's bank, this morning, we saw some very rich specimen rock, which was taken out at the Empire mine, on Ophir Hill. The specimens are valued at about \$800, but are only a portion of those taken out of the sixth level, about 620 feet from the surface.

Placer County.

Auburn Herald, June 13th: There has never been so much activity in our quartz mines as at present. The erection of custom mills is being made the means of opening several claims which could not otherwise be worked. The St. Lawrence is running night and day, crushing from 8 to 40 tons of rock during the 24 hours.

Dutch Flat Enquirer, 13th: The success of the Rising Sun Company, at Colfax, has proved a stimulus, and all ledge-owners are making preparations to develop their leads.

The Vermont claim-owners commenced washing yesterday, employing three pipes and 300 inches of water.

Yesterday Messrs. Kelsey & Co. commenced washing in the Jehosephat.

At Gold Run the miners are all very busy.

Plumas County.

From the Quincy Union of June 13th: At Sawpit, the Eagle Company have commenced washing up their pay dirt. The New York Company have finished cleaning up, and on Tuesday last they sold their dust, which is worth about \$18 25 per ounce, to Messrs. Conly & Co., of La Porte, and returned to Sawpit with about \$23,000 in coin.

At Greenhorn, Messrs. Heath & Co. have struck it rich. They made their first clean up, after about twenty days' pipping, one day last week, and took out over \$1,000.

The miners in the vicinity of Twelve

Mile Bar have an abundance of water, and are all doing well. The Halstead Company made a partial clean up, and took out about \$600; they will have water enough to pipe with the whole year. Hyde & Ward on Twelve Mile Bar, finished cleaning up last week; they averaged good wages for all the work done.

Sacramento County.

Folsom Telegraph, June 13th: A miner, named Samuel Spong, who has resided in Clarksville, off and on, for about 15 years, and has been to the mines of Peru, Frazer River, Washoe and Arizona, but always found his way back to Clarksville, struck a rich quartz ledge, not long since, and in a short time took out of decayed quartz \$3,000.

Sierra County.

Downieville Messenger, June 13th: At Sawpit Flat, the Buckeye Company is doing well. The New York Company, in twelve days' time, have taken out over 800 ounces. They expect to get ten or twelve hundred ounces out of their winter's pile of pay dirt. The Union Company are washing their tailings. The Eagle Company are still getting pay dirt. They get from ten to twelve dollars to the pan. Everything looks favorable. They will commence washing next week. The Union and American companies, at Washington Hill, are paying as usual. Six pipping companies have commenced operations—three at Richmond Hill and three in this place—operating night and day.

Council Hill letter: We have struck some new diggings between this and Scales' Diggings, and they are very extensive.

Siskiyou County.

Yreka Union, June 13th: Mooer, Grooms & Co. made a light run, with a little water they managed to get at intervals, in their claim at the lower end of Quartz Mountain, and obtained \$500. They cleaned up no bed rock. Bankey & Co., who have the old Shelley claim, are doing well.

Tuolumne County.

Sonora Democrat, June 13th: The Martin mine, on the North Fork of the Tuolumne, has been recently purchased by Hawes & Sherwood. They cleaned up week before last, and from forty tons of rock obtained ninety-nine ounces of gold. The rock was crushed in an arastra.

At the star mine, last week, a blast was put in the casement wall, at the north end of the lower tunnel, and rock of exceeding richness was exposed. A pump has been rigged to drain the old tunnel, a shaft will be sunk one hundred feet, and a tunnel run from the bottom under the vein.

Trinity County.

Weaverville Journal, June 13th: We are informed that new diggings have been discovered on the South Fork of Trinity, 2,000 feet above the level of the stream. Showers and partner recently took out about \$100 as the result of three days' labor.

Crow's flume over the Trinity below Lewiston is gone, and that portion of the ditch on the north side of the river, together with the water privilege, has been purchased by John Arn.

Wattles, Duff & Co., on Taylor Flat, are running two sets of sluices, and their claims hid fair to yield largely. Pelletreau & Bro. are doing well above the mouth of French Creek. R. B. Martin is getting fine prospects in the hill at the upper end of his ranch. Amos Smith & Co., at Cox's Bar, expect to make a handsome clean-up this season.

Water has been taken through the whole length of Frey & Taylor's new ditch. This work has cost over \$10,000.

Yuba County.

Marysville Appeal, June 13th: The Rattlesnake mine in the last two weeks, has made two runs of about 50 tons each, and the yield is \$25 to the ton, not including gold from the blankets.

ARIZONA.

San Bernardino Guardian, June 6th: Mr. J. R. Frink left here on Thursday last for Wickenburg. He takes with him a quantity of machinery for the Vulture mine. The Chinamen he brought down for employment in the mine, became suddenly alarmed as to their probable fate in Apache land, and skedaddled.

Prescott Miner, May 30th: Messrs. Little & Taylor have quit work for the present, upon their hydraulic claims on Lynx Creek. A scarcity of water was the cause of their stopping. Their last run paid well.

Roddick & Feland, who are prospecting the Chance Lode, are down about 40 feet in the new shaft, at which depth they have a good ledge. The water troubles them a good deal.

The Azlan Mill has been running day and night the past week, and the next clean-up will be a big one. Early in the week six

tons of tailings from the Chloride lode were run through, and yielded ten ounces of good amalgam.

The prospecting party has returned. They searched the Silver Mountain country, and succeeded in finding some rich lodes. At the head of Humbug creek, they prospected for placer diggings, and got as high as fifteen cents to the pan.

COLORADO.

Herald, May 27th: A party of Californians put some snitches in Nevada Gulch, near Quartz Hill last week, and are making good wages. Mr. Horne, in the gulch near the Porter mill, in four days last week took out \$80. Both of these parties are on ground which was supposed worked out years ago.

Borham, Miller & Co. have struck the crevice on claim No. 1 East, Bates or Hunter lode, and are raising a very fine quality of ore.

The Pleasant Valley G. M. Co., are about to commence work on their gulch claims. London & Queen are working in Russell, above the mouth of Illinois, Maguire & Queen above the mouth of Elkhorn, and Ainsworth & Cochran next to the Pleasant Valley Co., in Russell.

Mr. Fiske, of Black Hawk, will resume work on the Davenport lode, Central City district, in a few weeks.

With the Lexington and Stoner at work, every stamp mill but one in Nevada Gulch is now running, as follows: Lexington, 24; Porter, 18; Sykes, 12; Ophir, 24; Philadelphia & Colorado, 25; Stoner, 12; Mansur, 12; New Bedford, 12; Beverly, 12; unknown, 12; in all, 163 stamps, rattling away day and night.

In South Clear Creek, a great deal of gold is being taken out. Wright & Canfield cleaned up 51½ ounces of dust last week on Grass Valley bar, working four men. Brazier & Co. are mining on Chicago bar. Last Friday, they struck a streak of pay, yielding one dollar to the pan. Dick Skinner and "Esus Kris" have shut down temporarily on Illinois bar, in order to put in a new pump. Cooper & Schaffter are at work opposite the mouth of Chicago creek, with a capital prospect. On Spanish bar, considerable mining is being done. Capt. Dean let water into the upper ditch on Grass Valley Hill, yesterday. Griswold & Harder are taking excellent pay from their claim. The general prospect is more cheering than it has been in years.

Register, 28th: The new works being put up on the Winnebago lode, are approaching completion. All the hoisting machinery is in place, and the foundation for the stamps finely laid.

Four different parties are negotiating for the Fisher mill on Clear Creek. This looks as if it would soon be reopened for business. It has been idle for three years.

The number of miners and good working people daily arriving to take part with those that are here in the work we are doing, should guarantee the speedy opening of every idle mine in the country. Nothing like it has been seen since the palmy days when the daily arrivals were counted by hundreds.

Sugar Loaf Correspondence: Many very promising lodes have been struck in this district, the largest among which are the Townner and Mastodon. These are different locations on the same ledge. It is a very large ledge, cropping out at the discovery some twenty feet in width, and standing up five to ten feet above the surface of the ground. The croppings assay from \$10 to \$25 per ton in silver, with a trace of gold. The discovery shaft is 18 feet deep, and shows about a foot of nearly solid, fine looking ore. None of the lodes have been sufficiently developed to prove their character.

Another letter says: The Hoosier ledge in Gold Hill district crops out 20 to 40 ft. wide, and stands from 5 to 20 ft. above the surface of the ground. The ore from the discovery shaft assays from \$150 to \$1,600 per ton. There are several other large ledges in the vicinity.

Georgetown Miner, May 21st: Messrs. Crow & Clark have a force of about 24 men employed on the Terrible lode, and the road up the mountain leading to the same.

Brown Mountain is alive with prospectors.

We saw a button of silver the other day weighing 5½ ounces, which was taken from 3½ pounds of Munsell ore.

Work is reported as going on briskly at the National Treasury lode in Penn. District.

Same of 28th: The road to the Terrible lode is nearly completed. On the Munsell, a drift is being driven in fine ore 18 feet from the bottom. Most of the Equator ore will be sent east for reduction this season. So with the Terrible. A

new opening into the Griffith will be made soon....The tunnel on the New Boston struck the lode yesterday. The mine will now be timbered up and a drift run across so as to ascertain the width of the crevice. Fisher & Cooper are opening up some property in the vicinity of the Astor lode.... Messrs. Snyder & Peters are engaged in the development of three lodes on Sherman Mountain....Messrs. Chapin & Denison own seven-twelfths of the Winnebago lode. Work on the Herkimer goes on briskly, and the mine looks promising....Work on the Kashmiro will commence soon.... Messrs. Smith & Warren are pegging away at the Comet lode....The White lode is to be worked this season....The Flora McLane lode shows splendid ore....The Ashley Franklin lode has a foot of ore near the surface, which assays 54 ounces silver per ton.

DACOTAH.

Sweetwater Mines, May 23d: The Summit Ditch Co. broke ground yesterday and intend to have the whole work completed in, side of 12 days. The ditch will be $4\frac{1}{2}$ miles long in length and is intended to supply Oregon Gulch with sufficient water for mining purposes.

Some of the richest gold bearing quartz we ever saw was presented us yesterday taken from the Buckeye ledge, California district.

Mr. S. T. Sheppard found a $2\frac{1}{2}$ oz. nugget the other day in Meadow Gulch.

We are pleased to see the energy exhibited by the miners on Rock Creek in opening up their claims. There cannot be a question as to the claims paying well.

Two rich lodes, the rock of which exhibits free gold in abundance, were discovered and located a few days ago by parties who were about to leave for other parts.

Same of May 30th: In the Midas Co's claim, Atlantic ledge, California district, preparations are made for a vigorous prosecution of the work. The claim has been opened at three different points, showing a vein of about four feet. The ore prospects well.

We have visited the Father Price ledge, discovered and located by Jeff. Davis, situated about five miles northeasterly from South Pass City. It contains 2,200 ft., and the rock exhibits free gold in abundance. The ledge on the surface is about four feet, and widening.

On Tuesday we paid a visit to the placer claims in California district; among others we visited were Sheppard & Co's claims in Meadow and Yankee gulches. Although these gentlemen have but very little water, scarcely 15 in. to work with, yet their claims are paying well.

Messrs. Fairfield & Co's power astrata, on Willow Creek, below Hermit, is rapidly drawing to completion.

Owyhee *Avalanche*, June 6th: Sam Fry writes from South Pass City to a friend in town that there is some good quartz in that section of the country, but that those who go to Sweetwater with the expectation of finding good placer diggings are badly deceived.

IDAHO.

Owyhee *Avalanche*, June 6th: At no time during the past year were the mining prospects so encouraging as at present. Not a week passes away that does not bring to light new and rich discoveries, and the mines that have already been opened and are being worked, increase in width and richness the more they are developed. W. F. & Co. sent below on Tuesday morning nearly \$62,000 worth of gold and silver bullion.

The Golden Chariot Co. are now running a new level 100 feet below the tunnel, where the ledge is about three feet wide. It is getting softer and easier to work. The ore is still rich in gold, but as the depth increases, there is a corresponding increase in the proportion of silver. Large quantities of timbers are on the ground. A large space is being graded where the steam hoisting works will be placed.

The Ida Elmore continues as rich as ever, the ore being of about the same character as the Golden Chariot. The mine is being well timbered and the stopes and levels put in good shape.

Way & Vincent have recently struck rich gold and silver-bearing quartz on the second south extension of the Oro Fino, which was located in '63. Last winter, Tom Lawson bonded a portion of the ground to Way & Vincent, for \$5,250. For some time these gentlemen have been diligently prospecting the claim.

Wm. Reynolds has struck what is evidently a rich gold-bearing quartz lode, on the south side of the mountain near the second extension of the Oro Fino.

The Boyd Silver M. Co. has been incorporated to work the "First South Extension" of the Rising Star in Flint District.

The capital stock is \$1,600,000 in 1,600 shares.

Idaho City World, June 6th: A private letter from Lemhi, dated Salmon City, May 15th, says: The camp is paying very well, the generality of the claims yielding from \$20 to \$50 a day to the hand. The Douglass boys on Smith's gulch, had a dividend last week of \$3,000, after paying all expenses of opening their ground this spring. Nappies creek is paying better than ever. Bear Track, and Sierra and Meadow creeks are paying to nearly all an average of about \$40 to the hand a day. A great many bars are actively worked all through the diggings which were last year considered worthless, and they pay from \$12 to \$30 per day. Ben. Heath's flume is in operation, and I would not be surprised if the company cleared \$50,000 this season. Beer's flume to California Bar, started yesterday.

Wages are \$6 and \$7 a day, and men scarce. Provisions are reasonable, water is plenty.

Flint Creek has completely gone in. No ledge there. The mill closed down \$11,000 in debt.

MONTANA.

Helena Post, May 29th: In Jefferson gulch, E. Wall & Co. have been ground sluicing in their claim this spring with good results. On Friday and Saturday last, with two men shoveling in, the clean ups were respectively forty and sixty-three dollars. The hydraulic of Darah, Harris & Co., cleaned up for the last week's run, 39 ozs. of nice gold. On this claim four men were employed during the day time, and three during the night.

Four companies are mining with bed rock flumes in Haine's Gulch, and two more are getting ready. They have about sixty inches of water and are reported as doing well. In Bivins Gulch, there are also several companies at work drawing water for sluicing from Ram's Horn.

Several rich quartz ledges have been struck recently in the vicinity of Emigrant Gulch, and Mr. Cover talks of putting up a mill.

On Ophir Bar, below Blackfoot City, every claim is being worked and from \$11 to \$20 per day to the man is being taken out. A number of claims on Carpenter's Bar are also proving excellent. A 24-oz. nugget has just been taken out there.

We mention it as one of the evidences that Montana is "played out," that the First National Bank on Wednesday, cast gold bars, which weighed 1,682 ozs., of the value of \$31,047 in gold coin, equivalent to \$45,000 in currency.

The Crow Creek mines are yielding from \$8 to \$20 per day to the band. The three ditches cannot begin to supply water to all the diggings. Potter completed his ditch last week. It is about seven miles in length and will carry 1,000 inches of water. Another ditch brings 500 inches of water to the mines, while a third supplies 300 inches. A shaft, 27 feet in depth has been sunk on the Leviathan lead, showing a crevice three feet and six inches in width.

From the *Gazette*: A company is running a bed rock flume in Avalanche Gulch. There is an abundance of water and every indication of good pay.

Virginia item: Mr. Corbett has nearly completed the preliminary survey of the new ditch to be brought into Alder, and reports very favorably upon the chance of success.

NEVADA.

Esmeralda.

Anrora Union, June 6th: Sam Davis, who has just arrived from Silver Peak, informs us that times are very lively there. The track is graded from the wagon road to the mine, a distance of a mile and three-quarters, on which the track is laid half a mile or more.

At Hot Springs, things are moving along lively. The furnaces have been running out considerable bullion lately.

Pine Grove Correspondence: A large additional body of sulphuret ore has been struck in the Wilson mine, and there is enough in sight to run a 40-stamp mill for two years. They have just cleaned up another fifteen or twenty thousand dollars, the result of the last two weeks' run.... Toombs & Abrahams have had bad luck with their new mill, breaking several of the cams, but new machinery has arrived and everything is working smoothly. They have between five and six hundred tons of good ore on the dump....The Pioneer mill is running on ore from the Mountain View. This will probably pay \$20 per ton.... Work has been commenced on the Imperial mine by N. U. Sanders, with an excellent prospect.

Territorial Enterprise, Pine Grove Letter: Hon. W. T. Jones writes me from Ellsworth, Nye County, in relation to a new

discovery in the northeastern corner of Esmeralda County. The district is known as the Mammoth District. "In all my mining experience since '52, I have met with nothing exceeding it in promise of big results. The deposits are principally of gold. I have made several working tests of the ores during the past ten days. My lowest result from ores in which no metal was to be seen, was \$153.60 per ton. My highest, including both gold and silver, was \$3,200 per ton. Several have ranged from the lowest up to \$510 per ton. As yet there have been but four or five ledges located upon. The whole country for several miles around looks promising for more of the same sort. These ores, unlike the general run in this locality, may be successfully worked without reasting. [Our last issue contained a letter from this district.—Eps. Press].... The Midas mine is being opened out for another run....Capt. Blasdel has just informed us that Tom Priace has struck another pay vein in the Mountain View, which has a clay wall and is well defined. He says the vein is about two feet wide, and that the ore will not go less than \$30 per ton. Workmen who have just returned from the Central mine inform me that they have been taking out rock to-day which was really he-spangled all over with gold. It is the richest rock they ever saw.

Reese River.

Silver Bend Reporter, June 6th: Gillett & Clark have sold 300 feet of the Wyoming ledge to the agent of the Silver Mountain Co. The purchasers will immediately commence sinking another shaft 100 feet west of the works of Gillett & Clark. Col. Raymond has already a force of ten men at work, and will erect a mill at Rattlesnake Cañon at once. Messrs. Gillett & Clark have about 125 tons of rich ore ready for milling, and are driving their shaft downward night and day. In Hot Creek Cañon the little 10-stamp mill is undergoing repairs and will soon be in motion—having been leased by Messrs. Robertson & Crowell.

We have received from Mr. McCollum, who is now working the Brown and Del Monte mines in Bunker Hill District, a beautiful specimen of sulphuret ore from the former claim which assays over \$1,200 per ton.

Same of 10th: There are 19 bars of bullion in the Combination Co's vaults, of the value of \$19,000. The supply of salt has interfered with the regular working of the batteries, but it is now coming in and everything goes on as before.

Thirteen assays of ore from the Ophir and other mines in Manhattan District, were recently made at Austin, and the average result was \$430 per ton.

During the month of May the Manhattan mill at Austin, produced 102,657 ounces of bullion, valued at \$103,683.57. This is an extraordinary product for a 20-stamp mill.

Reveille, June 5th: Yesterday afternoon 11,000 ounces of crude bullion were brought from the Newark District into this city. The bullion was produced by the mill of the Centenary Co., and is the yield of eight days' run.

Some 3,000 ounces of crude bullion arrived in the city yesterday afternoon from Rigby's mill in the district of San Antonio.

White Pine Correspondence: The finest body of high grade surface ore ever seen east of the Comstock is now being taken out of the South Eberhardt. Think of a mass of ore 18 to 20 feet wide, which, with only a few pieces of second class rock thrown aside, will easily pay \$1,000 to the ton in the mill! An open cut four to five feet deep is being carried along the ledge, and pieces of horn-silver and stettefeldite, so large that one of them is more than the strongest man can lift, are being dug out from day to day. The Big Smoky Co. had an agent here a few days ago, who was so generous as to offer \$10,000 for this mine, but as the owners had at least \$5,000 worth of ore ready for the mill and \$50,000 worth more in actual sight, they naturally made fun of such an offer. The Keystone ledge, parallel with the Eberhardt, is yielding an equally fine quality of ore, but it is not over a quarter the width of the latter.

We saw this afternoon two small bars of bullion, weighing 1,275 ounces, .970 fine, and valued at \$1,601. They were the product of ore from the Hidden Treasure ledge, White Pine District.

Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

Territorial Enterprise, June 14th: A large pocket or reservoir of water has been tapped by the new shaft of the Sierra Nevada Co. at a depth below the surface of 750 feet. It is believed that the shaft has cut into the east stratum of the Comstock lead. The

water rose very rapidly and finally reached a height of 164 feet in the shaft. It has since been reduced 30 or 40 feet by hoisting and pumping. A new pump is being put in place.

There was a rumor on the streets yesterday afternoon that a big strike had been made in the Imperial mine, in the drift which has been run from the Imperial-Empire shaft at the 900-foot level, but it appears to have been a false alarm. The indications are considered very favorable in the drifts of both mines.

Gold Hill News, June 13th: The Empire drift has penetrated the Comstock ledge to the extent of about thirty feet and is now in very hard, barren white quartz, in which a small streak of good ore is occasionally encountered. The Imperial drift is also in barren quartz.

Trespass, June 13th: In Alpha, the machinery at the shaft has not as yet been placed in running order....In Belcher, the north drift toward the Crown Point line is being continued, with no noticeable improvement....In Crown Point, the south drift, 800-foot level, is in 134 feet, the face exhibiting some porphyry and a large amount of very rich ore. The upper levels of the mine continue to furnish the accustomed stope yield of excellent milling ore, and the assays have increased materially for several weeks past....In Chollar-Potosi, the drift—1,100-foot level—will be commenced as soon as the entire pump column can be placed. The old Blue Wing lode is yielding the principal amount of ore taken out, and for a week or two assays are much higher than usual. About 100 tons of ore are being extracted daily; and speculation as to the lower developments keep the stock well sustained....In Empire

mill, the drift—new shaft—is 38 feet west of second clay, in hard ground, and no ore yet in sight....In Hale & Norcross, at the lowest level the drift, this morning, is reported to be within a supposed distance of 16 feet from the ledge. On the 700-foot level, the drift south from southwest drift has developed a body of ore about six feet wide and assaying \$70. This body of ore is incased in a large vein of quartz, and is distant from the Chollar ground about 150 feet....In Imperial, for three days—being in the vicinity of the ledge, having cut the clay and tapped the vein—progress has been slow, and the force has been engaged in re-timbering, etc. The old shaft is to be also re-timbered and put in good repair....In Kentuck, work on the shaft continues—progress being slow, and the mine is yielding as good ore as usual from the various levels....In Savage, about 250 tons of \$40-ore are being extracted daily; though re-timbering in places will soon reduce that amount. The old stations present but little change. At the 6th station the timbers are all set, and drifting may be commenced at any time....In Sierra Nevada, the shaft at the depth of 214 feet (72½ feet from the surface) penetrated a vein of quartz and clay on the east, and tapped an immense reservoir of water. So great was the flow, that in 17 hours it increased in the shaft 164 feet, with a tank of large capacity hoisting to the first reservoir for the pump to drain. Last evening the water had been reduced 30 feet. In about a week it is expected that both pumps will be let down, the shaft drained, and work will commence on the east ledge, which it is believed has been cut.

During the past week, from the office of Wells, Fargo & Co. in this city, there were dispatched 4,736 pounds of assayed bullion, valued at \$162,623.30; from Gold Hill, 3,396 pounds, valued at \$117,648.53.

The Sapphire mill, in lower Gold Hill, is to be stopped next week for repairs.

UTAH.

Salt Lake Reporter, May 15th: From the information we can gather, there are rich and extensive gold diggings in Bingham Cañon. A miner from there brought in yesterday \$800 in dust, and sold it to Walker Bros. The Cañon is about twenty-five miles west of this city. About 150 men are at work there now.

PHOTOGRAPHING IN COLORS.—It is said that by a process which is still a secret, M. Adolphe Braun, of Dornach (Haut-Rhin), has produced absolute fac-similes of the best drawings by the great masters. These new photographs are superior to all former works of the same kind in excellence of detail and the surface quality. They also reproduce exactly the tint of the original,—neutral, brown, red, or greenish, as the case may be. They are confidently asserted to be absolutely permanent; but this must of course remain to be proved by time.

Canvassing Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office, Jan. 11, 1868.

Mr. C. T. Roney is our duly authorized agent for Sacramento County, Nov. 23, 1867.

Dr. L. G. Yates is our duly authorized traveling agent, July 6, 1867.

Mr. A. B. Butler is a duly authorized traveling agent for this paper, July 15, 1867.

San Francisco:

Saturday Morning, June 20, 1868.

Notices to Correspondents.

PNEUMATIC.—Faraday, as the result of his experiments, found that ammonia and sulphureted hydrogen, when solidified by pressure, each afforded a white translucent mass resembling in appearance crystallized ammonia; euclorine, a yellow explosive gas, which is evolved on gently heating a chlorate with hydrochloric acid, yielded under similar treatment, a transparent orange-colored crystalline solid. The other liquefied gases which were found susceptible of being solidified, furnished colorless transparent crystalline masses, like ice. Oxygen remained gaseous under a pressure of 27 atmospheres, at a temperature of 166° F.; and a pressure of 58.5 atmospheres at a temperature of 140° F., was found equally ineffectual in producing liquefaction. Nitrogen and hinoxide of nitrogen resisted a pressure of 50 atmospheres; with carbonic oxide, a pressure equivalent to 40 do.; coal gas, one of 32 do., and with hydrogen, one of 27 atmospheres was applied without occasioning liquefaction. In all the last described experiments, the temperature was maintained at 166° F. Owing to the great diffusive power of the lighter gases, such as hydrogen, the apparatus began to leak at comparatively low pressures; and thus placed a limit to the amount of pressure that could be employed when experimenting with them.

DEVALION, Sacramento.—The statements made by regular newspaper correspondents when describing or alluding to scientific matters, should always be received *cum grano salis*. Although usually possessed of general intelligence, these gentlemen cannot be expected to be versed in every variety of specialty; it is therefore not at all surprising that a New York correspondent of one of our city dailies has erred, and so misled you into the opinion that an effective but expensive motor has been discovered and exhibited in that city, which from its lightness, was adapted to propel aerial machines. The apparatus chiefly consisted of a galvanic battery of forty cells, so arranged as to develop a mechanical force equal to the one-tenth of a horse, or half of a man's power. Such an apparatus may not appear very heavy, *per se*; but a supply, and that a heavy one, of water and sulphuric acid, will be required to maintain such power,—a weight in fact sufficiently heavy to more than resist the tendency to rise of any machine, though inflated with hydrogen. To infer from such an exhibition as that lately made at the lecture-room of the College of New York, by the mere apparatus seen on its floor, would be about as wise as to calculate the weight of engines, boiler and fuel required to cross the Pacific to Asia, by merely estimating the dead weight of machinery, and one charge of coal only after the steam has been raised.

B. C. B., Duncan's Mill, Sonoma County. The "gritty substance" which you send appears to be a disintegrated talcose rock, with fine granular quartz. It might possibly be made useful as a polishing powder, for some purposes; but is not as good as the silicious material sold in this city under the misnomer of "silicon;" which latter substance can be had in unlimited quantity. The substance which you send has no affinity with emery.

CONTINENTAL Life Insurance Company,
302 Montgomery street, corner of Pine.

New Tendencies of Manufacturing Enterprise.

A lively interest is beginning to be manifested by capitalists in the Northern and Middle Mississippi Valley States, with regard to the introduction there of manufacturing operations. The fact is becoming apparent that the great cost of transportation to and from the waterfalls of the interior of New England, where the manufacturing of the country is now chiefly carried on, more than counterbalances the cheap fuel and low cost of living and labor near the great commercial and consuming centers of the West. Western men assert that they can even now manufacture at least sufficient for their own supply, and in many things successfully compete with Eastern manufacturers.

A late report of the Secretary of the Interior develops most unmistakably the tendency of our manufacturing industry. It is there shown, by carefully compiled statistics, that the amount of earnings averaged by operatives is less, at points near waterfalls, than at other points where steam is supplied by cheap fuel. It is even shown that the average earnings of the operatives of Lowell, Lawrence and Manchester, (the most favorable localities for water-power manufacture in the country) are considerably less than the earnings in those places where steam power alone is employed, with easy access to coal.

It is further shown that industry is more productive in money value at the West than at the East; and the prediction is ventured that the completion of the Pacific Railroad will so much improve facilities as to make the West, at an early day, the great seat of manufacturing industry, as well as the center of civilization.

As an exemplification of the westward tendency of manufacturing industry, even in its most delicate and complicated branches, we may instance the recent establishment at Elgin, Ill., of a large watch manufactory. Yankee clocks are celebrated the world over; but it was not believed until quite recently, that American ingenuity could produce so delicate an article as a watch in competition with the old establishments of Europe, where this business had its birth. The American Watch Company of Waltham, Mass., has effectually dispelled this delusion, and proven to the world that machinery can be made so accurate as to far excel in perfection the most delicate labor of the fingers; while the great economy in machine over hand labor is patent to all.

Europeans have never yet succeeded in largely utilizing delicate machinery. They utterly fail when they attempt the manufacture by machinery of a sewing machine, a Colt's or any similar firearm, a watch or a clock. The United States, for long years at least, will monopolize these branches of manufacture, and be the chief suppliers for the world; and in the future, with this as with many other branches of industry, the great and growing West will be sure to have its share.

The Mississippi Valley is the great granary of the North American Continent. With its cheap coal, cheap living, cheap labor and cheap transportation, it must be apparent that, with a proper direction of its fast accumulating capital, it must ultimately become the center of manufacturing enterprise. Food productions are necessarily bulky, and should be consumed, as near as may be, to the locality where they are produced; manufactures are generally less bulky, and more easy of transportation. Hence policy would seem to indicate that the manufacturer should ply his avocation in the vicinity of the producer; as by that arrangement the manufactured articles alone would go abroad to seek a market, while by the other, both must be moved at great cost of time and labor.

The industry of a nation should be as

carefully arranged and economized as is the business of a well ordered manufacturing establishment. The manufacturer, in arranging his works, always has an eye to the handling and conveying from point to point of everything which passes through the hands of his employes. He has everything so arranged, if possible, that the raw material goes in at one door or end of his works, and moves along gradually—the different materials all coming together just when and where they are wanted, until they finally go out at the opposite door or end, finished and ready for market. There is no passing back and forth; no unnecessary handling is allowed.

So it should be with the complicated industries of a nation. It is folly to transmit raw materials to an unproductive section of the country to be manufactured, where the food and supplies for the workmen must also be brought from a distance. Double the transportation is required that would be needed if the raw material (which must be moved) was taken direct to a food-producing region to be worked up. Time was when it was necessary to thus seek for water-power at almost any cost. Late improvements in steam machinery, and the attainment of cheap coals has changed the necessity for this, and a new policy must now be inaugurated. Capitalists are beginning to realize these facts, and act upon this changed condition of things. This matter is one of very simple practical economy, but one of great importance to California. The nature of its bearing on this State, we will endeavor to give next week.

DEDICATION OF THE MERCANTILE LIBRARY BUILDING.—The doors of the new Mercantile Library were thrown open at an early hour on Thursday evening, and crowds of people flocked in and dispersed themselves over the building, in admiring wonder at the beauty, elegance and taste displayed in the arrangement and adornment of the edifice. The library and the ladies' apartments were especially decorated for the occasion by splendid hoquets of fragrant flowers. The rooms were all brilliantly illuminated, and elicited from all sides exclamations of wonder and surprise at the unexpectedly superior manner in which the work of construction, furnishing and adornment had been completed. Long before the hour for the commencement of the exercises had arrived, the lecture room was densely crowded with an audience, a large portion of whom were ladies. The platform was occupied with the officers of the Association and several invited guests. After music from the band, R. B. Swain, Esq., the President, called the meeting to order, when prayer was offered by Dr. Stebbins, after which the dedicatory oration was pronounced by Hon. John B. Felton, which was followed by an address from the President. The dedicatory services were concluded by a benediction by Rev. H. Bush.

BROAD OR NARROW.—It is now pretty conclusively established that, for railroads, the broad gauge is the broad road to destruction. The cost of keeping in repair the six-foot gauge, owing to the great weight of the rolling stock, and the increased cost of that stock, as compared with the same items upon a road built with a gauge of four feet eight and a half inches, have been the cause of failure in several instances. The Superintendent of the Erie Railroad recently asked of the directors twenty-five thousand tons of new rails. This Erie road is one of the three only railroads now remaining in the United States which were built upon the broad-gauge plan. Another of the three, the Ohio and Mississippi, has repented and resolved to adopt the strait gauge and the narrow way which will insure its financial salvation. One rail is to be taken up and moved inward, the cars altered to conform thereto, and new engines probably procured. The last of the three roads, the Atlantic and Great Western, is in the hands of a receiver.

California Academy of Sciences.

REGULAR MEETING.

MONDAY EVENING, June 15, 1868.

President Dr. James Blake in the Chair. Dr. Stout presented, in behalf of I. W. Raymond, of the N. A. S. S. Company, a very fine specimen of the nest of the oriole, from South America. The same gentleman also presented, in behalf of Dr. I. Rowell, a curious Japanese zoöphyte, which was referred to Dr. Ayers for examination and report.

Before proceeding to further regular business, the President stated that, in consequence of the time likely to be occupied by the lecture of Mr. Louis Falkenau, the Council had thought it best to postpone the regular business. He believed that a meeting would be held next Monday, at which reports might be submitted, and other business transacted.

Mr. Falkenau then proceeded to deliver a very interesting address, which we regret we are not able to give in our present issue. The subject was the mining interests of the Pacific Coast, in the discussion of which he pointed out how the Academy of Science might aid in the development of the same by the general diffusion of knowledge,—a matter which came directly within the scope of their duty. We shall either give the lecture entire or copious extracts therefrom next week.

Several members endorsed the views of the lecturer.

Dr. Stout presented the report of the Building Committee. The Paul Tract Homestead Association had agreed to grant the Academy a block of land in South San Francisco, on condition that they erected a building, to cost not less than \$10,000, within the term of two years.

Dr. Stout observed, that within this time the Academy would probably consist of from 200 to 300 members, and if they could not raise from \$12,000 to \$15,000, the Academy ought to humble its head. All might not be able to do much, or all alike, but each could do something. For himself, he promised to give, within the two years, \$1,000, and if others would do the same, the first obligation of the contract could be immediately fulfilled. Other institutions in this city had received thousands upon thousands of dollars, almost without an effort, and surely this Academy, which avowedly stood at the head of science on this coast, should experience no difficulty in finding the funds for this purpose.

The matter was discussed at great length, but no conclusion was arrived at. The Academy adjourned until next Monday.

THE SIMPSON RUBBER PATENT.—An injunction was recently applied for by the administrator of Nelson Goodyear, to prevent infringement of patent by the use of india rubber for dental purposes under the patent of Edwin L. Simpson. The latter patentee describes his mode of preparing the article, in order to produce a vulcanite free from the odor and taste of sulphur; which, he says, occasions the principal objection to the use of rubber for dental purposes. Briefly stated, it consists in combining benzoin gum and linseed oil with the sulphur. He claims that the benzoin renders the compound nearly if not perfectly odorless.

It was held by the court, that the "specification of the Simpson patent does not pretend that the compound differs from the product formed according to the Nelson Goodyear patents in any of its qualities or properties, or capacities, except in being odorless and tasteless; and that although it might be an improvement and patentable, it does not follow that it can be made or used without the permission of the owners of the Goodyear patents." The injunction was therefore issued as prayed for.

EARTH CIRCUIT IN TELEGRAPHING.—The *Mechanics' Magazine*, speaking of the recent failure to transmit a current through a wire in one of the Lake Superior copper mines, says: In this case, an attempt was made to form an earth circuit in non-conducting material. The end of the wire in the mine was tamped into the solid rock, probably quartz, which would be about the same as tamping it into a glass bottle, filled with earth or water. The chances of electric communication would be still less, if the wire was not perfectly insulated in its whole length. The remedy would be to make a return circuit of insulated wire.

(Continued from Page 399.)

In this room are arranged all the books of reference, bound newspapers, periodicals, etc. Among the rare works found in this collection, is a most valuable compilation of California newspapers, from 1846 to 1856, made by A. S. Taylor, and the only one extant. Beyond this is the

LADIES' PARLOR AND READING-ROOM,

which is, as it should be, the most beautifully furnished apartment in the building. The entrance to this room is shaded by elegant curtains of lace; the floor is carpeted with the softest and most delicate pile, and the walls hung with medallion portraits of notable personages. The exquisite taste shown in the selection of furniture, mirrors, upholstery, etc., for this room, reflects the highest credit upon both the managers of the association, who directed, and upon Messrs. Plinn & Co. and Mr. Edwards, who were consulted in the matter, and who supplied the adornments. We may here add that the carpeting for the building, throughout, was furnished by Messrs. P. F. Loughran & Co., and the furniture by Goodwin & Co. The elegant mirror, which so truthfully reflects, from head to foot, the human form divine, was presented to the association by Messrs. Whittier & Fuller. The ladies will ever thank them for this elegant donation.

The ventilation of the Library Room, and indeed all the principal rooms throughout the building, is excellent. The shelving, cases and desks of the Library are of black walnut, finished with the highest degree of beauty consistent with usefulness and good taste. They were made by J. & J. Easton, of Market street. The lettering over each department into which the books are divided, is gilt upon green ground, harmonizing well with the somber hue of the dark-colored casings and cornices. A large terrestrial and a celestial globe, of mammoth and uniform size, form conspicuous and appropriate features in the Library. The three elegant Etruscan vases of porcelain, in the ladies' parlor, were presented by Haynes & Lawton. The gas fixtures throughout the edifice are elegantly and appropriately designed and arranged. They were furnished by Prior.

On the same floor, but in the rear portion of the building, are the chess and smoking rooms, and the rooms of the Trustees, Librarian and Janitor. The rooms are all warmed by a mammoth furnace imported especially from Boston, by Locke & Montague. It is one of the largest sizes made, and is placed beneath the grand staircase, in the entrance. Open grates are also provided in most of the rooms, to be used when thought advisable. The stairs, which constitute one of the principal and most important features of the edifice, were planned and constructed by Mr. N. P. Langland.

THE THIRD FLOOR.

Directly over the Library, of the same dimensions and on the third floor, is the Reading Room, which is furnished with commodious stands for newspapers, which are displayed and neatly secured to the stands by an ingeniously devised newspaper file invented by Mr. John A. Haugh, the Janitor. For the convenience of finding the different papers, they are geographically arranged, by states, counties, etc. The desks are also lettered and the papers on each numbered, and a register posted convenient to the entrance to further facilitate visitors in finding any particular ones which they may desire to consult. There are over 200 papers on file—some 20 of which are foreign. There are 61 magazines and 13 illustrated papers. Opening out of the main Reading Room, is another smaller one devoted to quarterly and monthly magazines, illustrated papers, etc.

THE MUSEUM AND ART GALLERY.

Quite a novel feature in this temple of literature and art, is a Museum of Minerals

and rare Curiosities, and an Art Gallery. The room devoted to this purpose is a large, handsome and well-lighted apartment, richly carpeted, one side of which has been furnished with a suit of most elegant cabinets, with plate-glass fronts, and within which are most tastefully displayed upon velvet ground-work a large collection of minerals, all most choice in character, and many of which are very valuable. The collection of spars, stalactites, stalagmites, and lead and copper ores are very superior—not equaled in the country. It recently arrived from the East and is now for the first time exhibited in this city. Large additions will soon be made from collections now on their way hither. It will no doubt be the nucleus for the ultimate collection of the most elegant and unique cabinet on the Pacific Coast. This rare and splendid collection of minerals is the private property of Mr. Alfred Stebbins, the gentlemanly Librarian, who has kindly placed it where the members of the association can have the fullest benefit derivable from its exhibition. The cabinets have been procured at a cost of about \$2,500, and are of most beautiful design and workmanship. They were made by Messrs. Miller & Haley, of the Empiro Steam Mills, Fremont street. Quite a number of beautiful paintings have already been placed upon the walls of this room, kindly furnished by artists for decoration and exhibition. It is proposed to make this a Gallery of Art, where California artists may exhibit their paintings from time to time, as they may desire. Paintings from Wandesforde, Wall, Burgess, Jewett, Arriola and others, already adorn its walls. This room will eventually become one of the features of the building, if not of the city.

THE FOURTH FLOOR,

which is inclosed by the walls of the Mansard roof, is divided into 24 rooms, in suits and single, suitable for artists' studios, offices, dormitories, etc. Quite a number of these rooms have already been taken.

This building, from basement to roof, reflects the highest credit upon its designers, its constructors, and all who have been in any way engaged in its erection or adornment. Those who ought to know, have freely asserted that no other Mercantile Library Association in the Union has such an elegant and well-appointed library building. The whole enterprise, from its first inception to its final inauguration, has been marvelously well done. We would here remark that the Association and the public are indebted, for more than they are probably aware of, to the individual exertions of R. B. Swain, the present, and W. H. L. Barnes, the late President of that body, for the successful issue which has been accomplished. Both these gentlemen have labored diligently and earnestly in behalf of the enterprise, in financial negotiations, and in otherwise encouraging and helping along the good work.

THROUGH TO RENO.—At 8.20 P. M. on Wednesday the last rail waiting to complete the connection of California with Nevada was laid. The cars now run to Reno, 154 miles from Sacramento. It is expected that in two weeks more they will run to the Big Bend of the Truckee, 33 miles farther. What would the men who were climbing and toiling over the Sierra nineteen years ago to-day, have thought of the lunatic who should predict that within that time the journey to Sacramento, the still far-off haven of their hopes, would be regularly made in twelve hours, and in a comfortably cushioned car? Less time than in some cases it took them to engineer an ox-cart a single mile! But nothing is very astonishing now-a-days; at least to an American. A year and a week from this time, the two oceans will probably be connected by continuous steam travel; and this chief wonder of a generation of wonders be completed, in one-third less time than even the most sanguine of its projectors dared to hope.

PATENT OFFICE REPORTS, from 1843 to 1847, MACANICAL, are wanted for duplicate copies at this office. Parties having them for sale will please state price, and address DEWEY & CO., Mining and Scientific Press office, San Francisco.

As if by magic comes repose,

Forget thy pain, forget thy woes.

This harmless Remedy stops all pain instantly, and leaves no stain. The tongue cannot mention any physical pain that this Pain will not remove in five minutes. Whether a trifling Burn, a gripping Colic, or a simple Mosquito bite, the result proves an entire relief from distress at any spot or place where applied. It is perfectly adapted not only for all pain, but also permanently cures the worst Ulcers, Piles, Cancers, or breaking out on any part of the body, and all internal complaints, by an outward application to the parts affected.

MOORE'S PAIN ANNIHILATOR, a standard remedy for Catarrh, Cold in the Head, Inflamed Eyes, etc., sold by all druggists.

O. H. MOORE, Inventor and Sole Proprietor, 652 Market street, San Francisco, Cal. 21v16-3m

Save Your Teeth.—Mrs. Jessup & Beers, over Tucker's jewelry store, are now making a specialty of filling the fangs of dead Teeth, and building up broken crowns with pure gold—thus restoring them to their original usefulness and beauty. They are also using Nitrous Oxide for the painless extraction of Teeth, when so desired—the only absolutely safe anesthetic ever discovered. In breathing it, it acts as a gentle stimulant, without undue excitement, the sensation produced being truly delightful, the effect upon the lungs healthful, and in its results positively free from all danger. Prepared and administered daily at the Dental Rooms of Messrs. JESSUP & BEERS, corner Montgomery and Sutter streets, San Francisco. 16v16f

Co-OPERATIVE UNION STORE.—This is becoming one of the most useful institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions 20 per cent. cheaper than ever before, and the very best articles in the market. The store is located at 115 Sutter street, Lick House Block, San Francisco. 6v16-am

California Pioneer Fuse

MANUFACTURING COMPANY,

MANUFACTURERS OF

HOSE AND TAPE FUSE,

A New and Superior Article for Blasting in very wet ground, or under water.

Oront difficulty has heretofore been experienced by miners, and others in the use of Fuse, which has been subjected to deterioration from exposure to dampness during transportation, or during the great length of time which has passed between its manufacture and use. In addition to great painstaking in the manufacture of the California-made Fuse, the above and many similar objections are entirely obviated, and the operator can always depend with certainty upon the burning of his fuse.

It is often the case that extra lengths are required, as exploding tunnels, etc., longer than is furnished in the imported article. Fuse of every desired length or size can be made to special order, at the above manufactory.

Manufactory, - - - Potrero, San Francisco.

WATER-PROOF BLASTING FUSE,

MANUFACTURED BY

THE BOSTON FUSE COMPANY.**This superior article gives great satisfaction to miners,**
and is sold at LOW PRICES.**The No. 2 exactly fits the caps used by the OIANT**
POWDER CO.**FREEMAN, SMITH & CO.,****Agents for the Company,**
110 California street, San Francisco.
19v16-3m**Heavy Iron-Work.****A writer in the Scotsman gives a descrip-**
tion of the iron-works of Messrs. Colville
& Gray at Coatbridge, a portion of which
we quote:**"The fittings of the forge are of the**
most gigantic character. There are two
steam-crane, capable of lifting fifty tons
each; four, forty tons each; and four, twelve
tons each; and these are so arranged that a
shaft or other piece of work may be passed
from one to the other all over the shop.
There are fifteen steam-hammers, varying
in weight from seven tons to two. Finished
shafts—that is, finished so far as the ham-
mering is concerned—were lying about in
all directions, and so delicately had these
been operated upon by the hammers that
the surfaces were so smooth that turning
would seem to be almost superfluous. Yet
they were destined, before leaving the place,
to be fitted into a lathe and turned with the
greatest exactness. In the heating furna-
ces and under the hammers were a dozen
more heavy jobs in the shape of crank-
shafts, rudder frames, and such like; and
as these were in all stages of progress, a
glance at them made plain the whole process
of forging. In making a crank-shaft, for
instance, a piece of iron eight or ten feet
long, and of suitable diameter, is used as a
"haft" or handle. At one extremity it
is fitted with cross-hars or levers, by which
it may be turned on its axis; and the other
end is shaped conveniently for having
smaller pieces of iron welded to it. The
welding end is placed in a furnace, and in
about an hour and a half is raised to a weld-
ing heat. The crane by which the iron is
moved about is fitted with a chain collar or
sling, in the loop of which the iron rests.
The collar works in a pulley attached to the
chain of the crane, and moves easily; so
that the shaft may be readily turned on the
anvil. When the proper degree of heat is
attained, the stopping of the furnace is re-
moved, the steam crane put in motion, and
the gigantic bolt is swung on to the anvil
of the steam-hammer. Several large slabs
of iron, similarly heated in another fur-
nace, are then brought out and laid on the
"face" of the "haft." A signal from the
headforgan, and the hammer drops upon
the glowing mass, and a dazzling shower of
sparks fly off in all directions. Again and
again the hammer descends, the iron mean-
time being carefully moved about, so as to
have the whole wrought into a homogene-
ous mass. Gradually the iron assumes a
dull color, but not before the desired end is
obtained. It then goes back to the furnace,
comes forth glowing, has another addition
made to its hulk, and so on. The most dif-
ficult part of the work is the formation of
the crank piece, which is forged solid, and
forms a huge square projection on one side
of the shaft. When the shaft has acquired
the proper dimensions, it is allowed to
cool, and the haft piece is cut off to be used
again. As the shafts are turned down until
a good surface is obtained, an extra inch or
so is allowed in the forging. The heaviest
work on hand at the time of our visit were
the shafts for two iron-clad rams, which are
being built by Messrs. Napier & Sons for
the British Government. These shafts were
upwards of fourteen inches in diameter.
All shafts are made in lengths of about
twenty feet, and these are made with flanged
ends, so that they may be firmly united.**For dressing and finishing such huge**
pieces of iron as we have described, special
and costly appliances are necessary. These
are located in the machine shop, an apart-
ment 150 feet in length and 50 feet in
breadth, both sides of which are lined with
turning-lathes, slotting and boring ma-
chines, and such like, of extraordinary size.
One of the turning-lathes is said to be the
largest in the world; and some idea of its
dimensions and form may be obtained from
the fact that the crank-shaft of the Monarch,
though weighing thirty-two tons, was
turned in it without taxing its capabilities
to the utmost. Some of the iron shavings
lying about the vast machine were fully
one inch broad and one-eighth of an inch
thick; yet these were turned off with appa-
rently as little effort as if the material had
been wood instead of iron. One of the
horing machines is sufficiently powerful to
drill a hole ten inches in diameter through
a solid hlock of iron, and the largest slot-
ting machine can send off chips a pound or
two in weight. When the work leaves this
department, it is generally quite ready for
being fitted into its place."**HEATED GUNPOWDER.—When gunpowder**
is heated up to the point of decomposition
previons to ignition, the force of its explo-
sion is greatly increased. It is stated that
a temperature of 160° Fah., increases the
force of the explosion one-fifth, while a tem-
perature of 400° nearly doubles it.

THE RICH COUNTRY OF THE APACHES.—Mr. Keller sends a communication to the Los Angeles Star of May 16th, from which we extract the following:

"The Southern Pacific Railroad will give us the Plancha de Plata country, lying between Arizona and the State of Sonora, now occupied by the cruel Apaches, which will be found richer in the precious metals, quartz and placers, than any known mining region in the world, with its mild climate, as rich and fertile soil as any in America, immense forests of oak, cedar, pine, ash, etc., and intersected everywhere with living streams that teem with fish as the forests abound with the wild turkey, and the deer and the elk and all kinds of game. The old Spaniards worked these mines upon a large scale previous to their expulsion in 1822 by the Mexicans. They maintained a cordon of military posts all along the line which now nearly divides Arizona from the State of Sonora; they reduced the Apaches to work their mines and to pray to the Virgin, each 500 Apaches being allowed a priest. The Apaches were Christianized to a certain extent and spoke the Spanish language forty years ago; they rose against the Mexicans in 1825, who neglected to maintain posts to keep them in proper subordination as the old Spaniards did. The Apaches now inhabit the finest lands in the world, are a settled people, that do as good agriculture as the Mexicans, keep immense herds of horses, mules, cattle, sheep and goats; they send out continually marauders to murder and bring home booty. Our soldiers in Arizona have not yet penetrated into the Apache nation, nor have they disturbed the granary from which they draw their supplies. A continental railroad, the miner, and the farmer will subdue and civilize the Apache, which our army can never effect."

DIFFERENCE BETWEEN NITRO-GLYCERINE AND GUNPOWDER.—A writer in the London Mining Journal for May 9th, thus closes his article: The difference between nitro-glycerine and blasting-powder for mining purposes is much the same as between detonating powders and gunpowder in guns. It is found in the latter case that when the powder evolves its gases too rapidly, its force is exerted against the side of the gun, or, in other words, all in one spot, instead of being so distributed as to produce the maximum effect in propelling the ball. It is the same with nitro-glycerine—it exerts great force, but, as the force is not distributed, the effect produced is very small. The only kind of ground in which nitro-glycerine is useful is where there is a good cleavage, as in slate quarries, the reason being obvious; if the bole be put in judiciously, the nitro-glycerine will shift as much as the toughness of the rock will hold together, and as the force is all expended on one spot, the slate will not be injured to the same extent as it would be were there no cleavage; but even in slate quarries the relative value of the two blasting agents will depend upon the nature of the rock, because, if the slate be at all inclined to be tender, the quantity thrown down by the nitro-glycerine will be no greater than with powder, whilst its shattered condition will be such as to render it almost worthless. But in all cases powder is to be preferred, because, as its gases are much less rapidly evolved, they have time to follow the cleavage as the rock opens, and thus produce the largest quantity of useful work with the smallest possible force.

THE GOLDEN ERA.

Founded in 1852, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its grant and rapidly increasing circulation. THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent.

THE GOLDEN ERA!

Is the most universally popular of all the Weekly Journals. It presents forty-eight columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected matter. It is a welcome guest in Cottage and Cabin; the favorite at the fireside in city and country; the most useful, agreeable and altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe and elsewhere. Every household in the mountains and valleys, the cities, towns and mining camps of California, and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor. Inspired with the genius of the age, it is progressive, and aims not so much at distinction as a newspaper, as at honorable success in its capacity of a great Moralizing and Improving Influence. Exercising a positive power for good, and wielding a permanent influence, many able and eminent writers choose its columns as a means of communicating with the public. No effort will be spared to make it a thoroughly California newspaper, and worthy of the support of all classes of our citizens.

JOHN PERRY,

MANUFACTURER OF

Cocoanut Matting, Rugs, Mats, Etc.

And Cocoanut Fiber for Upholstery.

South side Chestnut street, bet. Polk and Larkin streets, SAN FRANCISCO.

BY A PROCESS ENTIRELY NEW, THE PROPRIETOR is now manufacturing in quantity sufficient to supply the demands of the trade, A NEW AND SUPERIOR MATERIAL FROM THE FIBER OF THE COCOANUT—the best substitute for curled hair hitherto discovered—for mattresses, chairs, lounges, and all upholstering purposes. The following are some of the advantages which it possesses over all other materials used for the above named purpose:

- 1st. It is cheaper, all things considered, than most articles in use.
- 2d. It is the best and purest material known in the market, being entirely free from all offensive smell.
- 3d. It is the most durable, not being subject to rot after years of exposure to moisture and dampness.
- 4th. It is remarkable for its elasticity, rivaling, in this respect, the finest curled hair.
- 5th. It contains nothing to breed vermin or support insect life, being entirely free from process of preparation from all deleterious vegetable matter.
- 6th. It does not pack; is free from dust; much lighter, and in general obviates all the objections to pile, prepared shavings, soap root, and other inferior substitutes for feathers and hair.

Rheumatism, Gout, Lameness, Cramps,

Krupp's Exclusiveness.—The methods of manufacture carried on in the immense steel works of Herr Krupp, at the city of Essen, Prussia, have been for a long time carefully guarded from the curiosity of outsiders. At the entrance of the works an emphatic notice, in three languages, salutes the traveller; this sign-board states that admission to the works is, under all circumstances, absolutely forbidden; that it is of no use to apply for permission to pass through the forbidden portal, and that Mr. Krupp will be very much obliged if people will not pester him with solicitations. Apropos of this stringent regulation, we may mention the case of a well-known American iron manufacturer, who assaulted the grim portal of Herr Krupp with a handful of "first-class" letters of introduction, but without effect, as he was not permitted to pass one inch within the forbidden precinct. This exclusiveness may, perhaps, be accounted for from the fact that certain processes are carried on in the manufacture of steel in those works, which, owing to the peculiarities of the Prussian patent law, are not patentable; and the proprietor is unwilling that others should avail themselves, free of cost, of the results of his investigation and expenditure.—*Am. Artisan.*

SIXTH INDUSTRIAL EXHIBITION

The Mechanics' Institute.

THE BOARD OF DIRECTORS OF THE MECHANICS' INSTITUTE hereby give notice that the Sixth Industrial Exhibition of that Association will be held some time in August next, in a building to be erected for the purpose, in Union Square, in this city. Every preparation will be made to accommodate the exhibitors, with a view to make the Exhibition profitable, instructive and pleasant to all parties.

During the three years which have intervened since the holding of the last Exhibition in this city, the manufacturing, mechanical, scientific and useful, and ornamental arts have made unprecedented progress on this coast, and it is believed that the proposed Exhibition will exceed any other in value that has ever been held on the shores of the Pacific.

The plan of building to be erected, which has been adopted by the Board of Directors, it is believed will prove to be the best adapted both for display and convenience of the public, of any building ever erected in the State. The building will be perfectly water-tight, being covered with a single roof, so that no damage from the elements can be anticipated.

All parties who are interested in any of the branches of Manufactures, Mechanics, or the Arts and Sciences, are invited to exhibit in the proposed Exhibition, and to share in the publicity and consequent profit which always attend such enterprises. Suitable premiums will be offered, and the specific date of opening the Exhibition will be published at some future time.

By order of the Board of Directors,
1916-61 HORACE D. DUNN, Cor. Sec'y.

New Mining Advertisements.

Apollo Gold and Silver Mining Company, Lander County, Nevada.
Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fifteenth day of June, 1868, an assessment of ten dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, 225 Clay Street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the seventh day of July, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the third day of August, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees,
D. H. CROWE, Secretary.
Office, No. 225 Clay Street San Francisco. j20

Adella Gold Mining Company, Rock Creek, Sierra County, California.

Notice.—There are delinquent, upon the following described stock, on account of assessment levied on the thirteenth day of May, 1868, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificate.	No. Shares.	Amount.

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

All men are invited to examine these pans and settlers for themselves, at the

PACIFIC FOUNDRY,

San Francisco.

BLAKE'S QUARTZ BREAKER!

PRICES REDUCED!

MACHINES OF ALL SIZES FOR SALE

BY—

WM. P. BLAKE,

Corner First and Mission streets, or Box 2,077
3V13F SAN FRANCISCO.

Notice to Miners,

Well-Borers and Water Companies.

M. PRAG is now prepared to manufacture Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for that branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi Stoves, of the latest improved pattern, for vessels of all classes. Also, Ship Plumbing done.

M. PRAG,

8V13-ly Stove Store, No. 125 Clay street, below Davis.

HOWE & STICKNEY,

MANUFACTURERS OF

Models for Patent Machinery.

All kinds of

Silver-Plating, Locksmithing, Bell-Hanging,
etc., executed in the best manner.

No. 625 Mission street, near Second.

REMOVAL.

E. O. HUNT'S

Manufactory of

Windmills, Horse-Powers

and Pumps.

Has been removed from the old

stand on Second street, to

114 and 116 Spear st.,

Next above Stuart and south of

Mission St., San Francisco.

Hunt's Patent Wind-Mills, Tread

Horse-Powers, Sweep Horse-Pow-

ers, (for one or four horses), Saw-

ing Machines, Pumps of all kinds

for shallow or deep wells, in-

cluding Hunt's Submerged Pump,

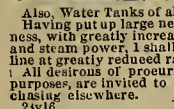

Hunt's Oble Pump, and Hunt's

Single and Double-Acting Pump.

Pumping Machines and general

Machinery kept constantly

on hand and built to order.

Also, Water Tanks of all sizes.

Having put up large new buildings specially for my business, with greatly increased facilities in the way of room and steam power, I shall be able to build everything in my line at greatly reduced rates.

All desirous of procuring water for irrigating or other purposes, are invited to examine my articles before purchasing elsewhere.

E. O. HUNT, Proprietor.

OIL STOVES!

MORRILL'S

Petroleum and Universal Oil Stoves

Have proved themselves a superior substitute for Wood and Coal Stoves, in that they work quieter, are neater, bake and broil better, are MORE ECONOMICAL generally. They are portable, can be used in any room, with or without chimney, as they emit no smoke, soot or ashes. There are nine different sizes, designed for barbers, dentists, and other mechanical purposes—as well as for cooking. They are perfectly safe.

I now offer a reward of \$100 for every Petroleum Stove exploded by Naphtha delivered at my store, 18 Geary street, where they are for sale by

M. B. BULLARD,

Proprietor of Petroleum Stove for California, and Agent for Universal Oil Stove for Pacific Coast.

N. B.—Petroleum Stoves burn Naphtha converted into a gas. Universal Oil Stoves burn Naphtha, Benzine, or Coal Oil, with non-illuminating flame and light on a wick as easy as a lamp.

Brodie's Patented Improvements

FOR THE TREATMENT OF

Gold and Silver Ores.

BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:

No. 1—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price.....\$600

No. 2—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour.....\$850

No. 3—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour.....\$1,200

These Crushers have been erected at several mines in the State of Nevada, and others in Calaveras, Tuolumne and Mariposa counties, to whom applicants can be referred as being the most efficient, cheapest, and least weight compatible with strength and durability, of any Crusher yet erected.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATOR BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866.

A SAFE, CERTAIN, AND Speedy Cure FOR NEURALGIA, AND ALL NERVOUS DISEASES. Its Effects are Magical.

It is an UNFAILING REMEDY in all cases of Neuralgia Facialis, often effecting a perfect cure in less than twenty-four hours, from the use of no more than two or three PILLS.

No other form of Neuralgia or Nervous Disease has failed to yield to this

WONDERFUL REMEDIAL AGENT.

Even in the severest cases of Chronic Neuralgia and general nervous derangements,—of many years standing,—affecting the entire system, its use for a few days, or a few weeks at the utmost, always affords the most astonishing relief, and very rarely fails to produce a complete and permanent cure.

It contains no drugs or other materials in the slightest degree injurious, even to the most delicate system, and can ALWAYS be used with

PERFECT SAFETY.

It has long been in constant use by many of our most

EMINENT PHYSICIANS,

who give it their unanimous and unqualified approval. Sent by mail on receipt of price, and postage.

JOHN J. FULTON.

Power for the Aeronaut.

In connection with an allusion to the coming exhibition to be held in London, under the auspices of the Aeronautical Society, *The Engineer* takes up, one after the other, the various plans which have been proposed for the propelling of flying machines. Not of balloons,—for those, it thinks, are out of the question;—if a flying machine is to be made at all,—it says,—it must be made without a balloon. The steam engine, hot-air engine, condensed air, and even coiled steel springs,—to be wound up by power while the machine is on the ground,—have been at different times talked of. Each of these is in its turn alluded to, and the various objections to each are stated. The article closes thus:

"In what direction then, exclaims the aeronaut, am I to seek for what I want? Is it a fact that we are so ignorant and helpless that, with all our knowledge and science, we cannot get power except in combination with great masses of metal? In a sense satisfactory replies mark out the path which the would-be flyer must tread. The engineer cannot help him to a motor. Let him seek the chemist and demand an answer to his second query. There are more ways than one of obtaining power known to chemistry, of which engineering has as yet taken little or no cognizance; of only one of these it is necessary now to speak. Solidified or liquefied carbonic acid represents the very incarnation of concentrated power. Under a pressure of 36 atmospheres, or about 530 lbs. per square inch, it liquefies at the temperature of 32° Fah., and if time be allowed for it to take its heat from the air, by permitting it to expand slowly, it will exert an enormous pressure. No successful carbonic acid gas engine has yet been constructed, probably because few attempts have been made to do so; but we believe Brunel actually made an engine worked by the gas. Such a machine could not prove of any practical utility except under such conditions as those imposed by the difficulties of aerial navigation; it would be rash, therefore, to decide that the gas cannot be used for the required purpose. It is true that the vessel containing it under pressure must be very strong; still but a small quantity of the gas need be carried, and therefore the weight of the vessel would not be great. As to the practicability of making a carbonic acid gas engine, it may reassure our readers to learn that Thilorier, who first liquefied the acid, in company with Brunel and many other men of science, held that the thing was perfectly possible; and for ourselves we hold that if there is sufficient stimulus held out the problem will be solved, and a carbonic acid gas engine made."

PRESERVATION OF FLOWERS.—The following is an excellent method of preserving flowers for an unlimited time in all their natural colors: A metallic vessel is provided with a movable top and bottom. The top cover is removed, and a wire gauze of moderate fineness is fitted into the top of the vessel, when the cover is replaced. Sufficient sand to fill the vessel is first sifted, and then placed in an iron pot with a small quantity of stearine,—about half a pound to one hundred pounds of sand.. The mixture is heated, and carefully stirred, so as to diffuse the stearine. The first vessel is then turned upside down, the bottom cover removed, and the flowers to be operated on are placed in the wire gauze, after which the prepared sand is gently poured in so as to cover the flowers entirely, the leaves being thus prevented from touching each other. This vessel is then put in a hot place—such, for instance, as the top of a baker's oven—and left for forty-eight hours. The vessel is then taken out, and while still bottom upward, the lower cover is removed, and the sand runs out through the gauze, leaving the flowers uninjured and dry, yet still retaining their natural colors.

TO NEUTRALIZE LOCAL MAGNETIC ATTRACTION.—Faraday has shown that if a small cubical space be inclosed by arranging square bar magnets, with their like poles in apposition, so as to form a chamber, within that space all local magnetism inferior in power to the magnets employed, will be neutralized. The same effect may be obtained with electro-magnets as with permanent magnets, and it is proposed in the *Mechanics' Magazine* thus to inclose the compass of an iron ship, as a remedy for the deviation by local attraction. A battery might be constructed to be excited by the sea water flowing through it, requiring no attention as long as the zinc plates lasted.

HEAVY ORDERS.—During the month of November, 1867, F. Krupp, of Essen, Prussia, received orders from Russia for fifteen hundred steel locomotive tires and eighteen hundred car-wheel tires, and from the East Indies for one thousand locomotive tires; he also received orders from the Spanish Government for two hundred steel four-pounder field-pieces, and from the Prussian Government for twenty-three 9-inch steel cannon; also orders for four steel double-cranked shafts, weighing twenty-seven thousand pounds each, for the Hamburg and Bremen steamships. In the month of March, 1868, Mr. Krupp received orders from the Russian Government for forty 9-inch guns, and from the Turkish Government for one hundred and twenty-six four-pounders. The price of each of the steamship shafts was \$14,000 in gold, and the Russian order for guns amounted to three-quarters of a million dollars in gold.

BUERK'S Watchman's Time Detector.

THIS WATCH-CLOCK WAS INTRODUCED TO THE public in almost every section of the United States and Canada about five years ago, and it has proved itself to be the best invention in the world for testing the faithfulness of Watchmen. Since its introduction, the Proprietor has improved on some parts, and corrected deficiencies, and he has now

A Perfect Check upon the Watchman. With other Clocks, a regular routine has to be followed, but with this Watchman can be ordered to visit any particular place as often as required, without being compelled to go to places where it is not necessary to visit as often. The instrument is compact, easy to use, portable, and as reliable as the best lever watch.

It is not so likely to become disarranged in its works as a good watch, because its parts are stronger. But when it needs cleaning, any common watchmaker can adjust it, its mechanism being simple. It requires no fixtures or wires communicating from room to room, as is the case with the ordinary Watch-Clocks; a small, inexpensive stationary key is alone required for its use. By its use places can be guarded that it would be impossible to guard with any other instrument, such as Railroad Tunnels, Bridges, Yards, Shops, etc. The instrument will in all cases be warranted perfect and satisfactory. Its price is invariably *Twenty-five Dollars*, cash on delivery, including as many keys as are requisite, not exceeding twelve.

THIS WATCH-CLOCK IS SOLD AT A LESS PRICE THAN ANY OTHER IN THE MARKET.

THE DETECTOR is used extensively by large Manufacturing Establishments and Railroad Companies in the United States, from whom numerous testimonials have been received.

As this Detector is covered by two U. S. patents, Parties using or selling these instruments without authority from me will be dealt with according to law.

N. B.—Parties purchasing these Clocks should test them sufficiently in the counting-room or office, as they will not be taken back after having been injured by the Watchman through carelessness.

All communications promptly attended to. Address
J. E. BUERK, Proprietor,
47 Congress Street, Boston.
P. O. Box, No. 1057. 23v16-6in

ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

Patented Nov. 1st, 1861; July 21, 1866; and Oct. 9, 1866.

Awarded the First Premium at the Paris Exposition.

ADAPTED
FOR
Smelting,
Foundry,
Mining
and
Steamships.

REQUIRES
Fifty Per Cent.
LESS POWER
Than any Blower
now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver mine; Gridley's Foundry, Gold Hill, Nevada; Aetna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

Our Potent Agency.

THE PATENT AGENCY OF THE MINING AND SCIENTIFIC PRESS
has been organized with remarkable success during the
past two years. The importance to the inventive genius of
this coast of a thorough and reliable agency for the solicita-
tion of LETTERS PATENT from the United States and foreign
Governments cannot be over-rated, and the Proprietors of the
Press, feeling the responsibility which rests upon them, and
the reward which must follow the faithful performance of
their trusts, will take care to afford inventors every advan-
tage to be secured to them through a competent and re-
sponsible agency upon this coast.

THE PACIFIC PLATE WORKS.—The importers of silver-plate ware, in this city, have always labored under very great disadvantage in getting their goods out, by reason of the rough usage to which they have been subjected, resulting in bruises which it has been impossible to entirely repair, and generally to more or less discoloration, arising from chemicals employed in the process of plating. The establishment of the Pacific Plate Works is expected to overcome all these difficulties, by furnishing to its patrons goods freshly plated and perfectly free from the scratches and bruises incident to the imported articles. It is also expected to answer a want long felt here for the replating of articles, which were never properly plated, or from which the silver may have been worn by long use.

Persons having in their possession family relics, can have them restored and rendered nearly as beautiful as originally, by application to the agent of the works. Hotels and restaurant keepers can have their castors, spoons and forks, plated with any required thickness of silver, instead of being compelled to accept the trashy, imported goods, having a coating with little more than the color of silver upon it. There is not a person in the community who is not almost daily disgusted with having a brassy spoon and fork furnished him at the restaurant.

The establishment of the Pacific Plate Works will render such a nuisance no longer excusable. The name Pacific Plate Works, being stamped upon any article, may be taken as a guarantee as to its character. The agents of these works inform us, that they will keep always on hand a large stock of goods ready to be plated at a very short notice with any stipulated quantity of silver, to suit the taste of the purchaser. Ice pitchers, which have now come to be considered an essential in every family, will be furnished with a great variety of designs, and persons intending the voyage *via* Panama, can have their want in this line answered by a 48-hour notice given to Messrs. Haynes & Lawton, the agents of the works, and through whom all the business will be transacted, at 520 Sansome street.

TRADE-MARK DECISION.—In the case of the Standard Soap Company *vs.* Lucy & Hymes, for infringement of trade-mark in making washing powders, the Supreme Court of California has just delivered an opinion dissolving the injunction, and holding that the name of the article, "Washing Powder," which the plaintiffs claim as constituting the principal part of their trade-mark, are words in common use, merely descriptive of the article; do not denote origin or ownership; are not peculiar marks, symbols or devices (as the Statute provides), and cannot be claimed as a trade-mark. The other portions of plaintiffs' label, which they claim as a trade-mark, are entirely dissimilar to defendants', except the bill of directions as to how the article should be used, which is claimed by the majority opinion as being common English language, open to all, except by copy-right, which the Legislature has no power to grant. The dissenting Judges concur on all points except the last mentioned, which is, that the defendants, in copying the plaintiffs' label *verbatim*, infringed that much on their trade-mark, and should have been restrained, but that the injunction granted was too broad, and should not have prevented Lucy & Hymes from making and selling Washing Powder, which is merely soap pulverized, and which every one has a right to make, without being broken up in their business by pretended monopolists.

NEW WASHING FLUID.—Mr. C. G. Kelley, of this city, has recently devised something new in the way of a washing fluid, which is represented as affording very reliable aid in the laborious household duty of washing. It is said to work with success with salt-water, and is therefore valuable for use at sea. This compound is manufactured and sold by C. G. Kelley & Co., at 215 First street, in this city.

HUNGERFORD'S IMPROVED CONCENTRATOR,

For Saving Gold, Sulphurets, Quicksilver, etc.

FIG. 1.

There is no description of machinery of so much importance to the mining interests of California, at the present time, as that for the separation of sulphurets. Mines are now abandoned, or, what is worse, paying assessments, which, if the sulphurets were saved, would yield handsome dividends. Great difficulty, owing to the varied form and character of the sulphurets, has been experienced in devising a machine to separate them; and it is only by close and patient observation, persevering study and careful experiment, that any machine can be made or matured so as to save a large percentage of them. The best is that which saves most with the least expenditure of time, money and power. Many have been tried, and abandoned; and none seems to meet the requirement of the mining interest so well as that now patented by Mr. Hungerford, which is an improvement on the well-known Hungerford & Prater Concentrator, with which his name is already so familiar.

Fig. 1 is a perspective view of that pan as now constructed. For economy of space and machinery, one shaft is made to drive two pans, which are set and arranged as shown in the engraving.

FIG. 2.

It should be borne in mind that Mr. Hungerford is the original builder and maker of the celebrated Prater Concentrator, and his name should be sufficient guarantee to warrant the public in examining his new machine before purchasing elsewhere.

RECOMMENDATIONS:

OFFICE OF THE ONEIDA MINING COMPANY,
JACKSON, May 13, 1868.

Mr. MORGAN HUNGERFORD—Dear Sir:—In regard to the four Hungerford Concentrators that I bought of Messrs. Goss & Lambard, last month, I will say that I put them up in the Oneida Mill soon after I arrived here, and find that they save sulphurets well and clean, and work to my entire satisfaction. I have tried many other concentrators, but these stand up and work better than any other I have used. I have ordered Messrs. Goss & Lambard to make eight more for me as soon as possible.

Very truly yours,

JAMES MORGAN.

BIG OAK FLAT, May 23, 1868.—Mr. Thos. Mulford—Dear Sir:—I have used two of Mr. Hungerford's Concentrators in the Rattlesnake Quartz Mill, at this place, and find that they work full as well as they are represented to do.

These Pans can be seen at the Pioneer Mills, entrance on Stephenson street, San Francisco. In future these Pans will be manufactured exclusively by GOSS & LAMBARD, of Sacramento, which is a guarantee that they will be built in the most substantial manner. Price, \$300. Address, Goss & Lambard, Sacramento, or M. HUNGERFORD, San Francisco.

The Cheapest.

Recommended by Railway Engineers, Conductors and Expressmen, and the most exacting class of watch-wearers, as superior to all others for strength, steadiness, accuracy and durability.

Unscrupulous importers occasionally place a worthless Swiss imitation in the market. To avoid imposition, the purchaser should invariably demand a certificate of genuineness.

For sale by all respectable dealers.

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING. 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SEMIOTIC COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, \$125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are various and expensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn.

Changing the Address.—No charge is made for changing the address of this paper. To give all necessary information, write us plainly as follows: "Change address of the Mining and Scientific Press from Mr. ... at ... P. O. ... County, ... State, to Mr. ... at ... P. O. ... County, ... State. 186-."

The Mechanics' Institute Fair and Pavilion.

Active progress is being made in the erection of the Pavilion for the approaching Fair of the Mechanics' Institute. The structure will be most admirably fitted to the purpose for which it is intended. It will be spacious, well lighted, and form a most commodious and convenient room for exhibitors. Ample space will be allowed for avenues by which visitors may pass to and fro, without inconvenience. The central space, under the nave or archway, flanked by opposite galleries, will present a really imposing appearance,—the open space between the galleries being 75 feet wide by 285 in length, and the distance from the floor to the top of the arch nearly 70 feet. The center of this parallelogram will be occupied by a fountain, surrounded by a most magnificent floral display. We understand that the horticulturists of the city and surrounding country have signified their intention to make this portion of the exhibition superior to anything yet seen, even in San Francisco. The beautiful collections of nature brought into existence and nurtured beneath the genial skies and balmy breezes of California, it is well known cannot be surpassed in variety and magnificence in any part of the world, and the determination is expressed to make the most of this elegant display.

A very general disposition is being manifested, on all sides, to render the forthcoming Exhibition one which shall be in every way worthy of the great interests which are to be therein represented. Although it may not partake of that cosmopolitan character which was originally intended, it will nevertheless be quite superior, both in detail and combination, to any which has preceded it on this coast.

The Exhibition will open on Saturday, the 8th of August. Already, we are told, the Art Gallery is entirely taken up, and the promenade galleries will have to be largely occupied for that portion of the exhibition. Two-thirds of the main floor has also been spoken for. It is a fact most gratifying to all that every foot of the Pavilion can be occupied with articles of California and Pacific Coast manufacture, without the admission of anything of foreign or Eastern make. The array of machinery will be very large, and will possess unusual interest. Three steam engines, certainly, if not four, each containing points of novelty and interest, and all made in this city, will be exhibited in such a manner that the working capacity of each can be fairly and fully tested. The show of mining machinery will be full.

It is to be hoped that California inventors will very generally take advantage of this opportunity to make known their invention by models or otherwise. There is no community on the globe, of equal extent, which has made a more marked progress in the inventive art during the past two years, than the inventors of California; and they will be unfaithful to their own in-

terests if they fail to present the results of their ingenuity at this exhibition.

The "art preservative of all arts" will occupy its usual place and prominence on this occasion. The executive committee have granted to the publishers of the MINING AND SCIENTIFIC PRESS the privilege of again issuing their DAILY FAIR PRESS in the Pavilion during the continuance of the exhibition; so that inventors and exhibitors will find at hand a convenient organ through which to spread before the public the advantages of their exhibitions.

The Institute appeals to all persons within the scope of its influence, who are engaged in any of the various branches of

Hackett's Improved Passenger Register.

We give herewith an illustration of an improved passenger register, designed to be attached to the ordinary seats of railroad cars, and so constructed that the various stations along the line will be indicated by a card placed convenient to each passenger. By the same device the number of passengers that enter a car and seat themselves can also be registered, as well as the particular station at which they take their seats and leave the same. This device has been invented by John C. Hackett, of Sacramento.

HACKETT'S IMPROVED PASSENGER REGISTER.

industry and art, to forward for exhibition such articles as they may have invented, discovered or made, and which may be useful, instructive, curious or suggestive. Those who intend exhibiting, and who have not already signified their intention to do so, should make the fact known as soon as possible, in order that the necessary room may be allotted to them. The California Steam Navigation Company and the San José Railroad, and we presume the Central Railroad, will transport packages to and from the exhibition free of expense.

THE BRANCH STATE PRISON.—Just at the close of the last season a bill was introduced and passed authorizing the establishment of a Branch State Prison at Folsom, and the expenditure, under the Board of State Prison Directors, of \$15,000 to secure the title to the land "at such a time as the Board may hereafter determine to be judicious." It now appears that the Board are slow in determining the time when it will be judicious to expend this money, and so the matter rests, and, in all probability, will rest for some time to come.

The engraving represents a section of the interior of a car, with the name of the station which the car is at the moment approaching. The names of all the stations on the route are placed on a circular disk, concealed within the wall of the car, as shown—each station in the order in which it is reached. These disks are operated by the conductor or brakeman—all the disks on a given car being operated simultaneously by the turning of a crank. A disk is placed for each seat, and a small opening in the wall allows the passenger to see at a glance the name of the station which he is approaching, as soon as it is brought to view. The attention of the passenger is also called to the act by a click, which he will hear within the wall at the instant the name of the next station is indicated.

The seats, when unoccupied, are intended to be turned up, as shown in the engraving. When a passenger enters the car the seat must be turned down before occupying it. The act of turning the seat down is registered on the machinery within the wall, as well as every station which its oc-

cupant may pass. Hence when he leaves his seat, at any station, the absence of the usual indication shows that that seat is then unoccupied. The next passenger which occupies the seat, invariably registers his presence and occupation of the seat, as already described. On arriving at the end of the route, the superintendent or other officer designated for such purpose, and who may have the key to the register, can readily determine the total number of passengers who have entered and left. This device thus gives the superintendent an effectual check upon the returns made by the conductor.

Applications for letters patent for the above invention have been made through the MINING AND SCIENTIFIC PRESS AGENCY. The invention will be more fully described when the pending application shall have been consummated.

THE SUTRO TUNNEL.—A bill has been reported in Congress granting six per cent. bonds to the amount of \$5,000,000 in aid of the Sutro Tunnel; the bonds to be delivered at the rate of \$15,000 for every 100 feet of tunnel completed, and to be secured by a first mortgage to the United States on all the net profits of the tunnel until the bonds are canceled. Whatever may be said in regard to the policy of such an appropriation (and much may be said both for and against it), Mr. Sutro is certainly deserving of much credit for the energy he has displayed in his efforts to carry out this important work. He has recently published at Washington an elegant quarto volume, containing a large amount of information bearing upon this work, from which it appears that he has given the subject much careful thought, and availed himself of the advice of the most skillful experts and most eminently practical men which the country affords. A fine map accompanies his published volume, giving a most distinct idea of the topography of the country for several miles about Virginia City, with the direction and location of the tunnel, reserved leads, etc.

The time is fast approaching when the Sutro Tunnel will be a work of necessity, and we hope that Congress will at once assist the enterprise in amount sufficiently liberal to secure its success.

THE TIDE LANDS.—The tide land commission appears to be entering upon its duties in a broad and enlightened manner. Individual and present advantages are likely to be ignored in deference to the magnificent future which evidently awaits our city. This harbor is destined to become one of the most important on the globe; and it is well that those under whose direction it is to be formed and shaped should take a broad and far-reaching view of their duty. The city front, thus far, has been most wretchedly managed. Let us hope that what is left will be properly utilized for the good of the future, and not for the gain of the present generation.

This issue closes the present volume of the MINING AND SCIENTIFIC PRESS. Next week the paper will present some new features, of which we shall then speak.

Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

The Late Discovery in Mammoth District.

ABOUT THE WEATHER.

I will be brief on this convenient subject; but the unusual manner in which the fickle old clerk does up the business hereabouts, this season, calls for remark. Usually the little snow that falls in this section during the winter, melts away from all but the higher peaks by the middle of March. Even the hardier varieties of grass and early flowers, in their baste, push their modest blades out from under the very edge of the snow banks early in March. This season, since the beginning of April, we have had a succession of showers, snow-squalls and respites of sunshine, all gratefully appreciated, as shown by the dense, luxuriant growth of grass that covers vale and mountain, even to the black, towering crags of basalt that top the highest ranges; not so acceptable, however, to the unsheltered prospectors in this vicinity.

WE MUST EAT,

but the question has been with all in this section for the past month, what shall it be? the miry condition of the roads between this and the present terminus of the railroad, has delayed the arrival of goods which are on the way to this region in large quantities. All the staples of food have been exceedingly scarce, or, I should say, not to be obtained at any price until recently. Provisions are now, however, arriving, and prospectors are gradually returning to their work, which they had temporarily abandoned in search of "grub" among such of their acquaintances as were more fortunate in having a supply.

MARBLE FALLS.

The owners of the original location on this ledge are stripping or removing the surface earth from about their immense outcrop of quartz. This work they propose to carry to the extent of their ground before sinking on it. The discoveries made as this work progresses are of the most surprising richness; the ledge is now cleared of the debris for 400 feet, showing it to be continuous, with several chimneys where it expands, in some cases to the apparent width of forty feet, (this great width will, in all probability, not continue.) So much has been said of the wonderful richness of the ore that I pass details in this letter; it may be comprehensive enough to say, that the expression of all who see it, is that it is the largest and richest body of ore ever found in the outcrop of any ledge. What it may prove below, is something for conjecture only, though the evidence of permanence would seem conclusive. No company should desire more than is to be seen in these outcroppings, and this seems to be the expressed feeling of the owners.

MORE LEDGES.

Contrary to the first impressions, this belt (by which I mean the formation in which the first discovery was made), is proving both extensive and rich in the extensions of the original ledge, and in other distinct lodes. On the second northwest extension the work continues, and, as shown by the accumulating pile of ore (principally silver ore,) the claim has but few equals in point of richness, although the vein is comparatively thin on this location. Southwest of this claim the owners of the Piute ledge are doing permanent work. They are now down ten feet, with an open cut and shaft twenty feet by ten. So heavy is this lode that the shaft is entirely in quartz. From thirty to forty tons of ore have been taken from this shallow opening. It is not of the extreme high grade that characterizes some of the others, but uniform and moderately rich, gold predominating. The Storm King and Holman ledges, on the opposite hill, are less developed, scarcely enough so to define their width, which is known to be eight feet in the former and five feet in the latter. The ore of these mines is also of uniform grade and has the advantage of being rich in silver, bringing the yield up to about \$300 per ton, as I am informed by Holman, the owner.

Mammoth Dist., Nye co., Nev., June 16.

The Mining Interests of the Pacific Coast.

Mr. Louis Falkenan, of the Pacific Chemical Works, read the following paper on the mining interests of the Pacific, before the California Academy of Sciences, at their regular meeting on the 15th inst.:

MR. PRESIDENT AND GENTLEMEN:—You have honored me by the allotment of a task which is highly gratifying to fulfill, and which I have undertaken with a full sense of my inadequacy of power to accomplish. If I do not shrink from the undertaking, you may ascribe it to my implicit confidence in your leniency, and to the hope which I cherish that my humble efforts may serve to open the way to those better fitted for the championship of the cause I espouse.

The mining industry of this coast, forming its chief source of wealth and prosperity, is so closely linked with our individual and social interests, that its past, present and future must naturally be constantly before our minds, and it would be more than arrogant on my part, should I presume to enlighten you on a subject upon which the greater majority of you gentlemen are far better informed than I am.

Let us, therefore, only cast a cursory glance at the present stage of our mining development and its prospects for the future, upon the results of which I can base my ideas of the ways and means for its advancement. After a long period of wild, wasteful management—or better said mismanagement—during which it was the sole object of the miner to wrest the greatest possible amount of treasure from the earth, in the shortest possible time,—we have now arrived at a period where the consequences of such a mode of proceeding begin to be felt, and the question arises as to the best means to remedy the growing evil. Our creeks and rivers,—the veins through which the current of commerce should naturally flow,—have been partly rendered impracticable, and are still becoming more so from year to year. Millions of wealth have been made inaccessible for generations to come, and millions lost for ever. Were we to continue in the course pursued hitherto, we would be doomed to see the rapid decline of our wealth and prosperity. But as every evil bears its own cure, sad experience will ultimately lead to a more rational system, and I fear it is the opinion of many that, by these means only, the evil can be overcome—a principle which holds good in many questions of social economy, but which can not be brought to bear upon this particular one. The damage done is irreparable; and with the full experience necessary to obviate all disastrous consequences for the future, we would arrive at a point where it would be too late to make them available.

Tempting though it may be, I shall not discuss the question of the limits to which legislation is justified and advantageous in the premises, as I deem it to be outside of our scope, and prefer confining myself to those boundaries within which our Association can exert its powers for the public good.

If we try to arrive at the root of the evil, we shall find that it may be chiefly attributed to two causes, viz: The want of knowledge and experience, and the reckless thirst for gain. It is only the former that we shall have to deal with in order to gradually force the latter into the boundaries to which a proper regard for our common welfare must confine it.

The diffusion of knowledge in general alone, would hardly suit the emergency of the case; it would only prepare the way for imparting that more directly applicable to mining pursuits. If it is the endeavor of the nation to found mining colleges, it should be that of the scientific public to insure their future, by impressing those who are to be more directly benefited by them, with the importance and utility of acquiring the knowledge thus made accessible to them.

The promotion of science is the object for which this body has been formed; let us consider in how far this object is connected with the diffusion of knowledge, general or special.

Science is the systematic arrangement of practical experiences and speculative deductions into one harmonious organism. Innumerable facts are collected into fundamental principles, and linked by the experimental and speculative work of generation after generation to an edifice continually nearing perfection, but infinite in its growth.

To promote science it is not sufficient merely to lend a helping hand to its internal development. An equally powerful agent for its advancement is indicated by the spirit of our age, which is signalized by the

practical application of science in contrast with the scholastic tendency of past times. To popularize science,—that is, to impart knowledge, to put to practical use the results of mental labor,—is to constantly increase the number of our fellow laborers in a great and holy cause, to do our share in accomplishing the end and aim of all science—the moral and physical benefit of mankind. It is that spirit only that enables our efforts, which, without it, would ultimately sink down to the result of a passion for certain pursuits which gratify our inclinations.

The popularization of science by diffusion of knowledge is therefore within our province, and it would not be easy to find a spot on our globe where this field of labor could be more beneficially cultivated.

So far I have only theorized. Allow me now to enter on the ways of putting into practice the results at which we have arrived.

I would propose to you nothing less than the establishment of a scientific mining and metallurgical bureau, in connection with the Academy, whose aim should be to obtain all possible information on the branches of industry mentioned, and diffuse the same by gratuitously furnishing it to all, and especially to those who apply for such information.

The institution should be connected with a suitable laboratory and an extensive library of works appertaining to mining and metallurgy, and it should be its aim to thoroughly investigate all questions propounded to it, and to publish all the information gained, in a shape easily accessible to miners and millmen. A cabinet of minerals, collections of models, and drawings of machinery, etc., would also form part of its requisites. The means necessary to such an undertaking should be raised by subscription among the citizens of San Francisco and of the State, and from other sources which I leave to be suggested by those who can better decide on that point. An institution such as I have but roughly outlined would meet with sufficient sympathy to support itself, and would accomplish the end in view in a shorter period of time than any other mode of proceeding. In connection with this, popular lectures on those subjects, as well as others of a scientific nature, by members of the Academy or distinguished guests, should extend the field of our usefulness.

If I have particularly referred to mining as the branch of industry to be kept in view, I would not have you think that our labors in time are to be confined to it. Agriculture, the arts, manufactures and handicrafts, would all be equally worthy of our attention and the communication of knowledge, which has no direct practical application, but serves to widen man's heart and mind, such as history, archaeology, etc., would equally have a share.

The means for diffusing knowledge at our disposal are only bounded by pecuniary considerations; our library, our collections, and the number of our members who would be able and willing to aid the cause in view, would go very far toward accomplishing the desired end. It is my firm conviction that it only needs the initiative step on our part to make away with all pecuniary obstacles. Suitable halls for lecturing might, to commence with, be obtained in some school house or college, and as our endeavors become known and appreciated, we will no doubt soon find either the authorities or the public willing and able to provide us with premises, where our collections and our library could be made more generally beneficial, and our meetings might be attended by all who take an interest in the subject discussed. Even if we were compelled to commence our labors on the smallest possible scale, they would soon awake the sympathy of many, increase our ranks, and enable us to do better in time. Written communications of a popular nature, would always find a hearty welcome in our principal papers, and go far toward accomplishing our end and extending our scope. I have long cherished the idea which I have put forth, and have gladly availed myself of this opportunity to lay them before you for discussion. Let me sum them up into questions, whose thorough discussion I take to be the first step necessary in the premises:

1st. Is it within the province of the California Academy of Sciences to diffuse knowledge, both general and special, by all suitable means?

2d. Would that object be gained by the means aforesaid.

3d. What steps should and could be taken in that direction?

While popularizing science and rendering it attractive to all, we need not in the least encroach upon our more strictly scientific labors, and in endeavoring to make

science more generally beneficial, we will gain the means for its more special pursuits. I am far from wishing that my views, as expressed in the foregoing, should be adopted by you, on the spur of the moment, without being thoroughly ventilated. I tender them, such as they are, willing to be better informed wherever I may have misjudged, still anxious to see them carried out as far as possible, if they are correct. If we encounter difficulties, they will not be insurmountable to earnest zeal and the honest endeavor of men who strive to overcome each and every obstacle in the path of science and enlightenment.

At the conclusion of the lecture, on motion of Dr. Stout, the thanks of the Academy were extended to Mr. Falkenan.

FRENCH, DECIDEDLY.—The railway carriages on European roads are divided into compartments. Now if a couple of travelers desire to secure a whole compartment to themselves for their entire journey, they have only to frighten off everybody else who attempts to enter. Nothing is so sure to do this as a crying baby. To meet the wants, therefore, of such as wish to travel alone, some ingenious Frenchman has devised an artificial baby, which, when wound up, can be made to squall at will. The machine is duly advertised for sale in the French papers. The price varies according to the unbearableness of the scream. The best kind is ten dollars; the same, however, if the yell is unceasing, is fifteen dollars. A second class, not quite so bad, but still utterly unendurable,—is five dollars. Both of the above styles of infant are perfectly natural in appearance, and would deceive the most experienced nurse. A third class,—made emall, so as to be carried in the pocket, and with only occasional cries,—say when pinched,—\$2.50. Our French friends advertise them as from "America,"—probably because almost all the ingenious inventions originate here; but we think that in this case Johnny Crapeau is for once entitled to the sole credit.

ETCHING ON GLASS.—This is done with hydrofluoric acid, prepared with a mixture of fluor-spar and sulphuric acid. The glass is covered with a coating of beeswax, through which the design is sketched with a pointed instrument. The mixture aforesaid is then gently beaten in a leaden tray over a spirit lamp, and the glass held over it; the vapor of the mixture attacks the glass where the lines were made, destroying the surface and producing the picture.

THE WOODPECKER'S FORESIGHT.—A. B. Barton gives this item in regard to the woodpecker in California. He bores holes in a pine tree into each of which he fits an acorn. When this begins to decay, having been saturated with the winter's rain, it is attacked by maggots. These furnish choice provision for the bird at a time of year when he would find it difficult to supply himself elsewhere.

TO DRAW A RUSTY NAIL.—Strike it with a hammer to break the binding of the iron rust with the wood, and it may then be easily drawn. Common nails heated red hot and then dropped into cold water, will clinch, and, in a great degree answer the purpose of expensive wrought nails.

CHEESE FROM THE MILK OF SHEEP.—Roquefort cheese is a variety which no one has ever been able to imitate outside of that small French neighborhood. This cheese is made from the milk of sheep, and is supposed to derive its peculiar flavor from a "cave" in which it is stored for some time before it is sent to market.

BOTANICAL.—Tropical fruits and plants, such as oranges, lemons, bananas, etc., in every variety and in all the different stages of growth, may be seen at Woodward's Gardens.

It is estimated that the machinery of Great Britain does the work of four hundred millions of men.

Mechanical.

ELASTICITY OF IRON AND STEEL.—M. Knut Styffe, Director of the Polytechnic College at Stockton, has made a series of experiments on this subject. We quote from a summing-up of his conclusions given by *Engineering*: Between 100° and 200° C., i. e. above the boiling point of water, the strength of steel is the same as at ordinary temperatures; the strength of iron is greater at that heat than at 15° C., and this increase of strength occasionally amounts to twenty per cent. The pliability or "softness" of steel remains about the same in the cold and in the heat, up to 200° C. The softness of iron, on the contrary, becomes less as the temperature increases. The limit of elasticity, both of iron and steel, is greater in extreme cold. In the heated state, steel keeps about the same elasticity (up to 140° C.), while that of iron decreases about ten per cent. With regard to flexibility of girders, the influence of temperature has shown similar results, viz., iron can sustain a greater load in the cold than at ordinary temperatures without showing any permanent set, the modulus of elasticity, both of steel and iron, decreases gradually with an increase of temperature. Under all circumstances the influence of the changes of temperature is greater upon iron than upon steel, but the effect of great cold has not been found by M. Styffe's experiments to be the same as is popularly supposed. On the contrary, great cold, instead of making iron and steel weak and brittle, seems to have the very opposite effect. The breakages observed in very cold weather, particularly in railway practice, seem to be due to secondary causes, such as the freezing and hardening of the ballast and wooden sleepers, the unequal contraction of parts shrunk or riveted upon others, and to the direct action of ice formed within the joints and crevices of iron structures exposed to the influences of the weather.

NEW PLAN FOR CASE-HARDENING IRON.—Thomas Sheehan, of Dunkirk, N. Y., has patented the following:

"In a suitable cast-iron box put a layer of broken limestone, two inches thick. Over the said layer place a perforated plate. On the plate next put a layer, of about two inches in thickness, of a mixture made as follows: 200 parts charcoal, saturated with water; 30 pounds of muriate of soda; 12 parts of sal-soda, pulverized; 5 parts of rosin, pulverized; and 5 parts of black oxide of manganese. The ingredients thus specified well mixed. Take the iron intended to be steelified, and put it on the top of said mixture. Another layer of the mixture is now put on the iron, and alternate layers of iron and mixture supplied until the box is filled, always finishing with a heavy layer of the mixture. Care must be taken to prevent the iron designated to be hardened from coming in contact with the iron box. Lute the cover of the box with a mixture of yellow clay and sand, with a little salt in it to keep it from cracking. The box will now be put in an open furnace, suitable for the purpose, and a fire made of hard coal and wood, and keep the box subject to strong heat from two to seven hours, according to the size of the box and the bulk of iron. As the heat increases, the carbon will be expelled from the limestone in the bottom of the box, and will unite with the oxygen and carbonaceous ingredients of the charcoal compound as aforesaid, and will convert the iron in the box into steel on its entire surface. I then take said iron out of the box when it is of a bright cherry red, and chill it quickly in a large vessel of cold, clear water. The surface of the steelified iron will now be smooth, and free from scales."—*Scientific American*.

TO COAT IRON WITH COPPER.—The copper or other coating is to be melted in a suitable vessel, and a stratum of borosilicate of lead placed on its surface; the iron is then to be plunged into the molten metal, and retained there until a coating is deposited on it. Iron coated with the tin or lead may be treated in a similar manner. Another method of coating iron with copper is to place in a crucible a quantity of chloride of copper, upon which is laid the iron to be coated, and over that a quantity of charcoal. The crucible is then submitted to a red heat and the chloride of copper fused, and a coating of copper deposited on the iron; or the vapor of chloride of copper may be employed for the same purpose. The coating of copper thus obtained, may be converted to one of brass by exposing the sheet of metal to the vapor of zinc in a closed vessel.—*Sci. American*.

HEATON'S STEEL-MAKING PROCESS.—One great difficulty which chemists have had to contend with in treating molten iron with chemicals, was due to the small specific gravity of the chemicals as compared with that of the iron. Mr. Heaton hit upon the plan of confining them at the bottom, by covering them with a perforated iron plate, held in its place by projecting edges of brick-work. This insured the action upon the iron of the gases arising from them. The *London Mining Journal*, in a recent notice of this plan, says: "The specimens shown by the Langley Mills Company at Middlesbrough, all made by Mr. Heaton's process, from Middlesbrough iron, must have convinced the most skeptical that 'the great metallurgical problem of our time' is on the eve of being solved; and our visit to Langley Mill has confirmed our own expectation. There the company with whom Mr. Heaton is associated have expended a large amount of capital in the laying out, under Mr. Heaton's supervision, much of upwards of four acres of ground, with all the appliances necessary to the carrying out of his method upon a scale which will enable them to manipulate, by rolling and forging, some 600 tons of steel and steel-iron per week. They can convert that quantity with their present machinery, but they cannot complete much over 60 tons. Their preparations embrace two departments—the one the reverberatory, and the other the casting; the latter will embrace more than 40 crucible furnaces. The conversion of the pig-iron into refined metal occupies from three to seven minutes only, and instead of the lapse of nearly five weeks being necessary to produce crucible steel it can be made in a few hours. A forging of crucible steel, which was in the state of pig-iron at 11 o'clock in the forenoon, was, a few days ago, carried away by a party of visitors who left Langley Mill at 4 o'clock in the afternoon. Rolled steel could be produced in even a shorter time, for the puddler is altogether dispensed with, and the ball furnace alone used for purifying the metal of the sodium left in it after the converter has done its work."

WELDLESS STEEL TIRES.—Weldless steel tires are now manufactured in England by rolling. The mill which is used for this purpose consists of two sets of rolls supported by the same framework, but each set working independently of the other. Hydraulic power is employed to press the rolls together. The first set of rolls consists of a single pair. The operation of making a tire consists in placing a hammered ring containing enough metal to form the tire between the first pair of rolls in such a way that the ring incircles one of the rolls. It is then enlarged by rolling, and its section formed in the same manner as a straight bar would be drawn and shaped in ordinary rolling mills.

The second set of rolls is similar to the first, with the addition of two side rolls mounted upon a pair of jaws which can be opened and closed by toothed segments operated by a worm having a right and left-hand thread. These rolls finish the tire. Seventy to eighty horse-power are required to drive this mill, and the entire operation is completed at a single heat. The same process has been in use for years in this country in the manufacture of weldless iron tires.—*Scientific American*.

PATENT ROLLING MILL.—Mr. Charles White, of Monmouthshire, has invented a rolling mill in which, by means of several pairs of rolls, some of which are vertical and others horizontal, the bloom is compressed alternately flatwise and edgewise, as many times as may be necessary to reduce it to the required size. By this arrangement, manual labor is entirely done away with, excepting that of one man to throw the pile into the first pair, and another to take the bar away. The iron is allowed very little time to cool; an important advantage.

TWISTED WROUGHT-IRON BARS.—The *London Mechanics' Magazine* refers to the recent examinations of samples of twisted wrought-iron bars which combine the four great essentials—strength, lightness, elegance, and cheapness. The bars are drawn from the rolls in the cruciform section, and twisted hot, so that the fiber of the iron is not injured. A regular twist of pleasing appearance is produced, two bars in some patterns being twisted together. The various sizes and patterns are well adapted for the purposes of ornamental ironwork in general. Although very light, these bars possess considerable strength.

Scientific Miscellany.

NEW MINERALS.—In the clefts of some of the silurian sandstones of Bohemia, two new minerals have recently been discovered and described. Both are hydrous phosphates of alumina, closely related to wavellite. One of these minerals has been called Barrondite, in compliment to a Bohemian geologist; the other will be known as Sphaerite, in allusion to the modular forms in which it occurs.

In the deposits of sulphate of lime, largely worked in Hartz county, Nova Scotia, three new borates have recently been discovered by Dr. How. They have been described under the names of cryptomorphite, natroborealcite, and silicoborealcite. Their formulas are respectively expressed as follows:

The name of Rewdanskite has been proposed for a new nickel ore, from Rewdansk in the Urals. It occurs as a greenish earthy mineral, consisting of hydrous silicate of nickel, in which much of the nickel oxide is replaced by magnesia and protoxide of iron.

PURIFICATION OF GAS.—A new gas purifying medium has been devised, bearing the name of "Prepared Iron Ore," which is said to possess important advantages over any other preparation for the same purpose. The article is said to be a preparation of oxide of iron, with some other substance which is capable of regaining its purifying qualities over and over again for a long period of time, with no appreciable loss except that incurred in handling. The *Gas-Light Journal* is told that the New York Gas-Light Co. have used it for six months with great satisfaction. It is said to effect a great saving of labor as well as cost of material.

TRANSPARENT GELATINE PRINTS.—The *Journal of the Franklin Institute* for May, describes some transparencies for the magic lantern prepared by Mr. Onderbridge by simply printing the cut directly upon sheets of gelatine. The finest lithographs may thus be easily taken; the most delicate lines showing perfectly. The only precaution necessary is to print with a dry stone, gelatine being very soluble in water. It may be made insoluble by mixing with it, while fluid, a small quantity of bichromate of potash and then exposing to light; this, however, slightly tinges it. This invention will find an extensive use in connection with the magic lantern.

A PROCESS FOR OBTAINING PURE IRON.—Troost gives a method of obtaining very pure soft iron. He melts cast iron in a lime crucible by means of the oxy-hydrogen flame, directed downwards. When the metal is fused he increases the proportion of oxygen, and thus burns away the silicon, carbon, and sulphur. The slag formed is absorbed by the crucible. When the operation is finished, a button of very pure metal remains at the bottom of the crucible. This process would be extremely useful on a large scale if oxygen could be procured at a cheap rate, but pending the discovery of means whereby oxygen can be prepared for industrial purposes, pure iron obtained in this way must remain a metallurgical curiosity.

THE COMING ECLIPSE.—Both English and French astronomers are making preparations for observing at the East an eclipse of the sun on the 18th of August next, which will be total for the space of 6' 46" along a line passing through Southern New-Guinea, Hindostan, the Bay of Bengal, the Malayan Peninsula, and the Gulf of Siam. Leverrier recommends that the French ships be placed on the eastern side of the Malayan peninsula for the accommodation of the observers. Some interesting questions regarding the "corona" and "red flames," it is hoped, will then be satisfactorily settled by means of the spectroscope.

Nitrogen and hydrogen, when absorbed by charcoal, diffuse into the atmosphere of another gas with such force as to depress the mercury three-quarters of an inch. Water expels mercury from the pores of charcoal by an instantaneous action.

HOW SPIDERS BEGIN THEIR WEDS.—Early in the spring of 1866, while arrangements were making for photographing a live male of the *Nephila plumipes* (the so-called "Silk Spider of South Carolina") the spider, after having several times traversed the circle of wire on which it was, suddenly stopped, took a firm position: the top of the frame and lifted; he abdomen, pointing it toward a large skylight which occupied the middle of the ceiling a slender, shining thread was seen to shoot forth from the spinnerets which, at the end of the abdomen; it seemed to have a rounded extremity, which advanced through the air rather quickly for a few inches, but afterward more slowly and steadily, and with an upward tendency, but always in the direction of the skylight. When it had reached the length of five or six feet, I allowed it to become attached to my coat; the issue ceased at once, and the spider, having attached the end of the line, turned about and began to pull upon it. I now broke it off near the wire, and, believing that there was a current of air toward the skylight, I blew gently upon the spider from various directions, and found that she always pointed her abdomen in the direction in which I blew, and that the thread was emitted in the same direction. So that while it seemed to have the power of projecting a thread for a short distance, yet it always availed itself of the prevailing current of air.

This single instance by no means proves that all spiders do or can employ this method of bridging over spaces, and it may be that on ordinary occasions they do, as every one has seen them, descend to the ground, emitting the thread as they advance, and pulling in the slack before attaching it to the desired point. But the former method enables them to cross water and to pass from tree to tree; while the well-known buoyancy of the silk permits them (or at least the smaller species) to sail along our water, hanging at the lower end of a line whose upper end is invisible.—*American Naturalist*.

CHANGE OF TONE WITH CHANGE OF DISTANCE.—The tone or pitch of any sound depends upon the rapidity of the sonorous vibrations, the higher the pitch the more rapid the vibrations. Those produced by the locomotive whistle probably range from 100 to 500 per second, in different locomotives. Let us suppose the vibrations are 200 per second. Then, since sound travels in air about 1,100 feet per second, each wave will be about five and a-half feet long. If the locomotive is approaching at the rate of twenty miles per hour—which is about thirty feet per second—we shall hear five more vibrations per second than actually occur; during that time, the locomotive having approached by a distance somewhat greater than the length of five of the sonorous waves. On the other hand, when the locomotive is receding, we hear five vibrations less instead of five more, making a difference of ten vibrations in a second, or one-twentieth part of the whole number generated by the whistle; a difference—amounting to nearly a semi-tone—amply sufficient to cause a very perceptible change of pitch.—*Cor. Scientific American*.

A MODE OF STOPPING POROUS CYLINDERS FOR HYDRAULIC PRESSES.—Kohn, an engineer in Berlin, gives the following as a method of effectually stopping up a porous cylinder, cast for a hydraulic press. The cylinder is to be heated over a charcoal fire to about 170° Fah. It is then to be filled up with resin and suspended by a crane over the fire until the liquefied resin is seen sweating through on the outside. The excess of resin is then poured out and the cylinder allowed to cool, when the pores will be found completely stopped, and no water can possibly pass.

CHLORIDE OF MAGNESIUM.—It has been announced that chloride of magnesium can unite and associate with magnesia, forming an oxychloride of magnesium, perfectly insoluble, and possessing the property of taking all variety of forms in a degree incomparably greater than plaster of paris. It is also capable of taking a high polish of a great number of substances with which it may be mixed, in the proportion of a fifteenth to a twentieth of their weight. The same is sold for meerschaum pipes.

A NEW ACID.—Dr. Hoffman, says the *Mechanics' Magazine*, has announced the discovery of a new acid which bears the same relation to naphthalene that acetic acid bears to marsh-gas. Recently the same eminent chemist communicated to the Royal Society of London the discovery of "the mustard oil of the ethyl series."

MANUAL OF VETERINARY SPECIFIC HOMOEOPATHY. By A. F. Cooper, San Francisco.

This is a pocket-size edition, partially intended to accompany cases of medicines. It treats of horses, cattle, sheep, hogs, and dogs, and their specific homoeopathic treatment; referring to ventilation, precautions to be observed in buying a horse, etc.; an essay on the stallion; and the laws of transmission and progeny explained. So far as examined, we judge the work contains many useful hints and explanations of importance to every owner of domestic stock. People generally are too ignorant of the nature of live stock, and the proper care necessary to relieve them from the numerous attacks of disease to which they are subject, and which in most cases might be readily repulsed, avoiding fatal results. Mr. Cooper is a practical veterinary surgeon, permanently located at 815 Market street, San Francisco.

SIGNIFICANT.—Our agricultural implement dealers, in all parts of the State, unite in the testimony that the sale of harvesting and other agricultural machinery has been heavier this season than ever before known in the history of the State. It is reported by the interior press that some single townships are employing from 50 to 100 harvesters, with a proportionate number of headers, reapers and mowers. This great demand for agricultural implements has also set our inventors to work improving the various machines sent hither from the east, and devising new ones. Several such inventions, of a most promising character, have been illustrated from time to time in our columns. It appears to be pretty generally conceded that the most valuable steam plow yet invented anywhere, is the California plow of Coffin & Standish. We have also seen the drawings and model of a new harvester, which consists of a combination of the reaper and thresher, by which the operation of reaping, threshing and sacking is all performed by a single machine, at an expense of power and labor far less than can be reached by any other machines in use. The caveat papers for this invention went to Washington by the last steamer. We shall soon be allowed to speak of it more fully.

SUPPLEMENTAL AWARD.—A meeting of the Board of Agriculture, held at Sacramento on Wednesday last, among other business, decided to award two additional gold medals, in accordance with the recommendation of the Committee on Gold Medals appointed at the last Fair. One of these medals was awarded to the San Francisco Glass Works (at foot of Third street) for the best exhibition of glassware, at the last State Fair. The other medal was awarded to Isador Landsberger, for his exhibition of sparkling wines. Preliminary arrangements were also made towards holding the next annual State Fair.

PUBLIC DOCUMENTS.—We are under obligations to Hon. D. R. Ashley, for the volume of "Reports upon the Mineral Resources of the United States, by Special Commissioners J. Ross Browne and James W. Taylor." The volume comprises 360 closely printed pages; also for "Annual Report of the Commissioner of Patents for the year 1865." We are under obligations to Hon. John Conness, for the Congressional Globe and Appendix for the first session of the fortieth Congress.

SANTA CLARA COLLEGE.—The Commencement exercises of Santa Clara College took place on Thursday and Friday. This college was founded in 1851, and has been in successful operation ever since. It now numbers nearly 200 students, including the preparatory department. The faculty consists of twenty-one in number—Rev. A. Varsi, President.

There are said to be 20,000 mechanics, who have been regularly bred to their calling in Chicago.

New Patents Issued to Pacific Coast Inventors.

Specially reported by the U. S. Patent Office, Washington, D. C., to DREW & CO., American and Foreign Patent Solicitors, and Publishers of the MINING AND SCIENTIFIC PRESS.

ISSUED FOR THE WEEK ENDING JUNE 2, 1868.

78,464.—IMPROVEMENT IN GANG PLOWS.—Don Carlos Matteson, Stockton, Cal.:

1. I claim the bars E, F, attached to the front ends of the beams A, B, with the perforated draught-bar G, attached thereto, substantially as and for the purpose specified.

2. The attaching of the caster-wheel J, to a single arbor, K, provided with a scraper, f, substantially as and for the purpose set forth.

78,597.—IMPROVED SHOE FOR SEPARATORS. Michael Laufenburge, of Two Rocks, Cal.:

I claim the combination of the screw I, with the two inclined sieves C and C', vibrating in alternation, substantially in the manner and for the purposes herein described.

ISSUED FOR THE WEEK ENDING JUNE 9, 1868.

78,669.—IMPROVED PLATE FOR ARTIFICIAL TEETH.—D. S. Hutchinson, San Francisco, Cal.:

I claim a flexible cavity plate having in part or in whole the palatine portion of the plate made of flexible material D, in connection with a compound cavity or series of cavities, united or otherwise with a cavity on the center or palatine portion of the plate and upon the internal or external (or both) borders of the alveolar ridge, substantially as and for the purpose specified.

78,703.—IMPROVED SPURS.—Sam. Wehrly, San Francisco, Cal., assignor to self and E. V. Sutter, of same place. (Antedated May 4th, 1868.)

I claim a spur having the dog o, the rack m, and arm d, together with the spring c, and slotted plate b, the whole constructed and operating substantially as and for the purpose described.

78,718.—IMPROVEMENT IN PICK HANDLES. Wm. Blay, Helena, Montana. (Antedated June 4th, 1868.)

I claim the metallic strap B, constructed and applied to the pick handle as shown and adapted to be pressed through the eye of the pick and secured therein by means of a key m, as described and represented.

78,723.—IMPROVED TRACTION RAILWAY BRAKES.—R. d'Heureuse, San Francisco, Cal.:

I claim the double flanged or grooved wheels for brakes on railway cars applied and operated substantially as herein described and represented.

78,724.—IMPROVEMENT IN HOES.—Josiah Dodge, Grass Valley, Cal.:

I claim, in combination with a hoe, the pick B, and the forked shank D, substantially as and for the purposes herein shown and described.

78,733.—IMPROVED APPARATUS FOR TURNING WRIST PINS, CRANK PINS, ETC.—Theodore A. Goff, San Francisco, Cal.:

I claim the arrangement of the several parts of the machine as herein recited, whereby it may be used to turn off a wrist pin or a crank-pin in place as set forth.

78,774.—IMPROVEMENT IN HORSE HOES.—Elisha W. Walton, Stockton, Cal., assignor to self and Wm. H. Derrick, of same place:

1. I claim the regulating brace m, constructed substantially as and for the purpose above shown.

2. The standard E E, of a horse hoe, constructed substantially as above described.

3. The reversible hoe point D, with its slot or mortise x, constructed and operated substantially as above shown.

4. The reversible shares A, and also their two sharp cutting edges, constructed and operated substantially as above shown.

5. The mold board B, (in combination) with the share A, substantially as above shown.

6. The wedge L, with its screw and nut, constructed and used substantially as and for the purpose above described.

7. A horse hoe, with or without the mold-board B, constructed and operating substantially as above described.

78,825.—IMPROVED FORGING APPARATUS.—Nelson Peterson and Geo. W. Jones, Antioch, Cal.:

1. The bar H, with its slotted lever N, screw P, and spring I, in combination with the link J, and handle B, substantially as described.

2. We claim the bearings E, having the recesses d, d, for supporting the axle D, so as to allow the hammer to be used on any part of the anvil, substantially as described.

78,831.—IMPROVED PROCESS OF TREATING GOLD AND SILVER ORES.—Louis Edward Rivot, Paris, France, assignor to Jacques Gaillardon, San Francisco, Cal.:

1. The roasting by means of superheated steam of auriferous and argentiferous ores when previously contained or mixed with oxide of iron substantially as set forth.

2. The roasting of auriferous and argentiferous ores by mixing therewith oxide of iron combined with iron or roasted pyrites, and then submitting the whole to the action of superheated steam substantially as set forth.

Notices of Recent Patents.

78,835.—IMPROVEMENT IN BOOTS AND SHOES. Nicholas Lumsden, San Francisco, Cal.:

I claim the regulating guide, consisting of the sliding rod L, and its adjustable nut M, together with the screw plate I, and the wire holding clamp, the whole constructed and operating substantially as and for the purpose described.

2. I claim the adjustable last standard, constructed and operating substantially as and for the purpose described.

3. I claim the device consisting of the spring W, rod V, cylinder g, and barrel h, for obtaining a perpendicular motion of the last, and a pressure against the screw plate, substantially as and for the purpose described.

The design of this invention is to provide an improved machine for the manufacture of screwed boots and shoes on unplated lasts; the object being first, to construct a gauge by which the length of the same and the depth to which it penetrates, shall be regulated, so that it will not be necessary to plate the last with metal to stop the screw; second, to construct a clamp so made as to secure the wire firmly while the screw is being cut, and yet be easily disengaged when necessary. It also consists in a movable support for a last, which can be operated by the foot, to withdraw the last from the machine, while by means of a slide and adjustable turning joints, the last is easily moved and turned into any desired position for receiving the screws.

This apparatus is sold for from \$35 to \$50. Heretofore the only machines in use for doing this work have been a French machine costing about \$400, and an American invention costing \$125. These prices have put such machines out of the reach of most individual shoemakers, while the apparatus of Mr. Lumsden is brought within the reach of every one. It is simple and strong, and a person can learn to use it in half an hour's practice.

THE PACIFIC CHEMICAL WORKS.—We acknowledge the reception of a very finely executed photographic view of the Pacific Chemical Works, on Sixteenth street, near the crossing of Polson. We have already made several extended notices of this establishment. The proprietors, Messrs. Falkenau & Hanks, have recently made extensive additions to their works, and it is their intention to continue to supply additional facilities, as the demand for chemicals on this coast increases.

NEW CALIFORNIA MONTHLY.—Roman & Co., the well known publishers, will issue the first number of a new magazine on the 1st of July. It is to be called "The Overland Monthly." It is the design of the publishers to make it a first class literary periodical. It will be, as far as may be, local in character; but pertaining to the entire Pacific Coast, and not especially to California. The enterprise is an important one, full of promise, and one which we trust will prove a pecuniary success to its enterprising projectors.

THE GALAXY, for June, has reached us. Its contents are rich and varied. The department of literature and art contains contributions from some of the first writers in the country. Terms \$4 per year; Sheldon & Co. publishers, N. Y. W. E. Loomis, agent, San Francisco.

MORE CONCENTRATORS.—Three more of Hendy's Concentrators have been shipped, the past week, for Grass Valley—two for the North Star and one for the Empire mill. Each of these mills are now running ten of these concentrators.

SORGHUM SUGAR IN SAN FRANCISCO.—A company was some time since organized in this city for the manufacture of sorghum sugar. An agent is now in the East for the purpose of procuring the best machinery and to thoroughly acquaint himself with the latest improvements in this manufacture. The machinery will be here by the last of August, and will be put in operation in season for working up the incoming crop. The company has a field of cane of 150 acres, now growing at Alviso, from the product of which they expect to manufacture 250,000 pounds of sugar, besides the resulting syrup. They expect to be able to afford this product at a much less price than the cane sugar syrup is now selling for.

The Sacramento Beet Sugar Company is also making progress toward active operations. They also have an agent in Europe, acquiring the best attainable practical knowledge of the business, mode of manufacture, character of machinery, seed, etc. The company is determined to go slow and sure; but they are nevertheless fully determined to go into active operation at an early day. We are rejoiced to notice these evidences of progress in our manufacturing and productive industries.

SAWMILLS ON THE LINE OF THE RAILROAD.

We are informed that five of Hendy's gang sawmills have been sent out from the Union Foundry during the past six weeks, to be put up along the line of the Central Pacific Railroad. One or two of these mills are each capable of sawing 80,000 feet of lumber in twenty-four hours. They are all to be employed by the railroad company in getting out ties and other timber for the road, an immense amount of which will be needed for constructing the track across the timberless region of the Great Basin.

AGRICULTURAL COLLEGE LANDS.—A bill has passed the House of Representatives providing that not more than three sections shall be located in any one township, with agricultural scrip. This will put an effectual stop to the use of such scrip to further the interest of speculators. It would be well if a similar rule should be applied in all locations of land. It were even better that the sale of railroad reservations were kept in the hands of Government, and the proceeds only handed over to the railroad companies. Large landed monopolies always retard the growth of a country.

HAYES' PATENT FIRE LADDER.—The new patent fire ladder, to which we have already several times referred, was again tested on Thursday evening last, opposite Wells, Fargo & Co's. A large number of spectators were present to witness the mode of its operation. It was found to work in all respects most satisfactory. This ladder is the invention of Mr. Hayes, Superintendent of engines for the fire department of this city.

ON FILE.—We have on file electrotype plates for the following illustrations, which will appear soon: American Watch Company's establishment, Waltham, Mass.; Markland's Saw Gummer and Sharpener; Christoffel & Booth's Elliptic Scraper and Tube Cleaner for Boilers; Hill's Elastic Ventilating Inner Soles for Boots and Shoes, and Lowe's Portable Printing Press.

NEW INCORPORATIONS.—Articles of incorporation have been recently filed in the County Clerk's office in this city as follows:

ORIENTAL G. & S. M. Co.—June 23d. Capital stock, \$3,600,000; 1,800 shares, \$200 each. Trustees: Jas. W. Moyle, S. C. Burke and Mathew Rudsdale.

METROPOLITAN M. Co.—June 23d. Capital stock, \$600,000; 6,000 shares, \$100 each. Trustees: A. P. Stanford, Charles Hosmer, M. L. McDonald and N. W. Chittenden.

ELECTION OF OFFICERS.—GLOBE G. & S. M. Co.—Trustees, J. H. Winchester, J. S. Powers, V. B. Post, W. H. Manning and S. H. Roberts; President, J. Winchester; Secretary and Treasurer, V. B. Post.

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board.

SAN FRANCISCO, SATURDAY MORNING,
JUNE 27, 1906.

CITY STOCKS.

The market for miscellaneous stocks continues quiescent. We note sales of Pacific Insurance Company stock at \$120, and Occidental Insurance at \$78. North Beach and Mission Railroad sold at \$65 50; California Steam Navigation Company stock at 69 1/2 per cent.; Spring Valley Water Company was in the market at \$67 1/2 per share.

The receipts of the local insurance companies during the month of May, and previously this year, according to the returns made to the Internal Revenue Department, have been as follows:

	May.	Previously this year.	Total.
Pacific.....	\$60,911	\$253,119	\$314,030
Union.....	31,183	140,513	171,696
National.....	49,883	131,370	181,253
Fireman's Fund.....	18,808	71,866	90,674
Builders.....	21,547	73,134	94,681
California.....	8,369	48,482	56,851
Merchants' Mutual Marine.....	10,620	68,004	78,624
Occidental.....	6,840	23,331	30,171
Home Mutual.....	12,719	33,374	46,093
San Francisco.....	3,325	18,891	22,216
Peoples.....	6,531	25,200	31,731

Totals.....\$222,983 \$914,001 \$1,146,984

The returns were made upon a legal tender basis, the rate—72 cents for January, 71 cents for February, 72 cents for March, 72 cents for April and 72 cents for May—being fixed every month by the Assessor of the district.

The above statement shows a decrease of \$7,078 as against the receipts in April. The receipts of the several companies in May, as compared with April, show the following difference:

	Income.	Decrease.
Pacific.....	\$24,890	\$2,500
Union.....	14,186	1,432
National.....	18,944	1,361
Fireman's Fund.....	3,713	611
Builders.....	4,423	1,376
California.....	1,376	47
Merchants' Mutual Marine.....	1,376	47
Occidental.....	1,376	47
Home Mutual.....	1,376	47
San Francisco.....	1,376	47
Peoples.....	1,376	47

The receipts of the city railroads for the month of May and previously this year, have been as follows:

	May.	Previously this year.	Total.
Omnibus.....	\$26,729	\$93,336	\$120,065
North Beach and Mission.....	12,196	82,758	94,954
Central.....	15,044	51,212	66,256
Front Street, Mission and Ocean.....	9,022	30,734	39,756
Market Street.....	10,390	28,641	39,031
Potrero and Bay View.....	1,840	5,940	7,780

Totals.....\$86,201 \$292,622 \$378,823

Showing an aggregate increase of \$6,413 in May over the receipts of April. The receipts of May as against April show the following difference:

	Income.	Decrease.
Omnibus.....	\$1,432	1,432
North Beach and Mission.....	1,361	1,361
Central.....	611	611
Front Street, Mission and Ocean.....	1,376	1,376
Market Street.....	1,376	1,376
Potrero and Bay View.....	47	47

During the month of May the receipts of the San Francisco and San Jose Railroad amounted to \$30,823; San Francisco and Oakland Railroad, \$23,227, and the Mission Bridge Railroad, \$1,111.

Mining Share Market.

During the past week, the mining share market continued in an apathetic condition, showing a considerably decreased volume of transactions. We may remark that the season of recreation, now fully at hand, contributes largely to the general dullness of the market. However, our information from the various mines on the Comstock lode the present season, as compared with the same time last year, shows an increased aggregate yield, though, as a general thing, the developments in the lower levels have not yet proven very satisfactory. Continued vigorous prosecution of work will, we believe, bring a bountiful reward, and then we may look for a strong market. The market shows increased activity at the close.

From the Owyhee region, we learn that one firm at Silver City, during the month of May, assayed bullion amounting to \$229,558, and that the yield of the "camp," for the same time, as returned to the Revenue Assessor, amounted to \$378,688. The *Avalanche* says that next month the principal mines and mills will be in operation, and that a year hence the bullion product of the Owyhee mines will not be far short of a \$1,000,000 per month.

SAVAGE—has been less active than last week, opening at \$154 50, improving to \$160, then selling at \$155, and closing at \$156. The ore product during the past three weeks has been as follows:

Week ending May 6—1,768 tons, valued at.....	\$47 24 per ton.
Week ending May 13—1,730 tons,.....	49 90
Week ending May 20—1,692 tons,.....	44 29

During the week under review the south mine, on the fourth station, yielded 1,063 tons against 1,768 tons the previous week, and it is stated that this portion of the mine is opening out exceedingly well. On the track floor the breast is now thirty feet wide, and several floors above it reaches a width of sixty feet—producing ore very rapidly. The quality of ore is not quite so good as it was last week, and this, with the lessened product of first-class ore, reduces the general average for this week. On the fifth station, north mine, the main drift is in a mixture of clay and porphyry. The cross-cuts, both east and west, show a section of the vein for 135 feet. To the west it is chiefly quartz, with some

spots of ore; and the east is principally porphyry, and begins to resemble the Potosi formation. In the south mine, same level, the drift is in fine ore, and is now more than sixty feet from the line. The breast they are opening around the old winz is reported to look well. They expected to commence the sixth station the present week. The bullion returns for June account, so far, aggregate about \$240,000.

IMPERIAL—met with lessened inquiry at declining rates, falling from \$160 to \$120, recovering to \$140, and closing at \$133 50. On the 23d inst., they had penetrated the vein on the lower level a distance of thirty-two feet, and it is calculated that they will have to run sixty feet more to get under the east end of the drift run from the 700 level of the old works, at which point the vein carried some pay ore. The usual amount of ore continues to be extracted from the upper levels. Bullion sent forward on the 25th inst., \$12,655, making \$35,617 for account of June.

CHOLLAR-POTOSI—was in light demand, selling at \$245@260, and closing at \$257 50. The ore extracted during the week ending June 19th, amounted to 830 tons against 652 the previous week; and 828 1/2 tons were sent to custom mills during the same time against 690 1/2 the previous week. The Blue Wing section is the only portion of the mine yielding ore at present, and it is believed that this supply will be kept up for some time yet. Prospecting in the "Belvidere country" is thought to look favorable. The drifts from the 1,000 and 1,100 levels running east, show hard rock in the face.

CROWN POINT—was quite active under a decline, receding from \$104 to \$94 50, and closing yesterday at \$95. On the 20th inst., the shaft was ninety-five feet in depth from the 800 station, and running in soft rock. The south drift was 165 feet from the line, and reported to look poorly. On the upper floors the breasts are said to be in from five to nine feet of \$40 ore. The drift running south, on the 800 level, has already carried a paying body of ore some fifty feet further than did similar drifts on any of the upper levels, which fact is thought to promise well for the future of the mine. The various floors working south between the 700 and 800 levels are reported to look very well. The bullion receipts to date for June aggregate nearly \$73,000.

KENTUCK—sold at \$400@377, then at \$382 50, and closed at \$385. The bullion returns for June, so far, reach \$41,136 58. GOLN HILL QUARTZ was in the market at \$82 50@86. The second shipment of bullion amounted to \$3,032 28, making \$5,950 44 to date for June.

HALE & NORCROSS—sold to a considerable extent, declining from \$80 to \$65, improving to \$91, and at the close sold at \$87. In the lower level they penetrated the vein some twenty feet without obtaining encouraging results, and they are now placing a turn-table in order to drift upon the vein.

YELLOW JACKET—was dealt in at fluctuating rates, rising from \$1,100 to \$1,190, falling to \$1,085, rising to \$1,200, and at the close realizing \$1,210. The *Trepasser*, of the 20th, says: "The 730-foot drift presents an improved appearance. The shaft is being sunk slowly, a tank sufficing to keep the water clear. The pump is being put in place, and an immense spur-wheel substituted for driving the gearing."

ALPHA—opened at \$57 50, declined to \$46, rallied to \$52 50, and closed at \$52. We learn that prospecting will soon be commenced, the shaft having been repaired and the machinery put in running order. An assessment of \$5 per share was levied on this stock on the 23d inst.

SIERRA NEVADA—rose from \$25 to \$32, and then realized \$29@31 per share. It is said that all three of the pumps will be in working order by to-day. They struck quartz and clay in sinking to the 700 level; and, later, it is reported that a vein of ore has been reached at the bottom of the shaft. BULLION sold at \$23 @19. No encouraging results at date in drifts from 1,200 level.

The sales in the Board during the past week have been as follows: Regular sessions, \$1,192,302; open sessions, \$473,453—total, \$1,665,755.

COMMENCEMENT EXERCISES.—The commencement exercises of St. Ignatius College, on Market street in this city, took place yesterday and day before, too late for any extended notice in the present issue.

CHARCOALS differ extremely in absorbing power and in the capacity of uniting with oxygen; animal charcoal possessing the latter property in a greater degree than wood charcoal.

It is rather a humiliating fact that all the mechanical power exerted by a man during his life is more than covered by the power stored up in one small cart-load of coal.

CONTINENTAL Life Insurance Company, 302 Montgomery street, corner of Pine.

PACIFIC QUARTZ ROOFING CO.—We have already made several allusions to the manufacture at Folsom, of a new character of roofing material, and designated "quartz roofing." It is prepared from finely pulverized quartz, saturated with some bituminous liquid, which renders it firmly adhesive and exceedingly pliable. It is prepared and put on cold; hardening in about forty-eight hours. It can also be used as a paint for covering either metal or wood. It may be made of any shade of color and adheres as firmly to tin or any smooth metal, as any paint we have ever seen. It is water-proof and quite as fire-proof as any of the asphaltum preparations now used in this city. The patentees claim that they can cover a roof with this material one-third cheaper than the same roof can be covered with any other material in use. The proprietors are Messrs. Meredith & Garrigan, who have filed a caveat for the invention. They are about establishing themselves in this city, where their place of business will soon be announced.

SILK BUSINESS.—A week or two since we referred to the large preparations made by Mr. Hoag, of Sacramento, for the production of cocoons the present season. It appears that Mr. Hoag is not the only one that is going largely into this business. The *Los Angeles Republican* of June 20th, says Mr. D. F. Hall, of San Gabriel Mission is now feeding 180,000 worms, which at a low estimate will produce 900 pounds of cocoons, worth at least \$2,250. Mr. H. will next year raise trees sufficient to afford food for 1,000,000 worms, which will produce 5,000 pounds of cocoons, which will be worth over \$12,000.

THE DUROMETER is the name of an instrument recently introduced into use for testing the hardness of metals. It consists of a properly constructed drill, operated with a given uniform pressure, and continued for a certain number of turns. The hardness of the metal is determined by the depth to which the drill will penetrate with a given number of turns. It is largely employed in France for testing the hardness of railroad iron. Most of the French contracts for railroad iron are now conditioned upon a test by this apparatus.

MR. THOMAS HILL, member of the S. F. Stock and Exchange Board, died in this city on Wednesday last. Mr. Hill, formerly a prominent merchant in Sacramento, has been a well-known broker here for several years. He leaves a large circle of endeared friends and relatives residing in this city and his native town, Northampton, Mass.

UNIVERSITY COLLEGE.—The contract for the erection of the College on University Mound, just out of the city, on the San Bruno road, was let to Mr. Thos. Moffat, on the 18th inst. The building will be two and one-half stories in height; dimensions, ninety feet by sixty feet, with projections; style, French Gothic. The building will be entirely completed in November next.

HOSE COUPLING.—Mr. James H. Fox, agent for Bush & Hanson's new hose coupling, has shown us a sample of the same. The coupling exhibited is for a 2 1/2-inch fire hose. It is constructed so as to lock together almost instantly by a cam motion. The device is plain and simple, not likely to breakage or misapplication. One piece couples with any other, without regard to rights or lefts.

PATRONIZE THE LADIES.—Any one wishing to procure anything in the way of furnishing goods, will be well fitted at the Women's Cooperative Union store, No. 39 second street, between Market and Mission. Don't be bashful.

PRESERVE YOUR SIGHT.—Adopt spectacles suited to your eyes. C. Muller, optician, 205 Montgomery street, stands at the head of his profession. Try him.

PATENT OFFICE REPORTS, from 1843 to 1847, Mechanical, are wanted for duplicate copies at this office. Parties having them for sale will please state price, and address DEWEY & CO., Mining and Scientific Press office, San Francisco.

As if by magic comes repose,
Forget thy pain, forget thy woes.

This harmless Remedy stops all pain instantly, and leaves no stain. The tongue cannot mention any physical pain that this faint will not remove in five minutes. Whether a trifling turn, a grinding Gout, or a simple Mosquito bite, the result proves an entire relief from distress at any spot or place where applied. It is perfectly adapted not only for all pains, but also permanently cures the worst Ulcers, Piles, Cancers, or breaking out on any part of the body, and all internal complaints, by an outward application to the parts affected.

MOORE'S PAIN EXPELLER, a standard remedy for Catarrh, Cold in the Head, Inflamed Eyes, etc., sold by all druggists.
G. H. MOORE, Inventor and Sole Proprietor, 652 Market street, San Francisco, Cal. 21v16-3m

SAVE YOUR TEETH.—Mrs. Jessup & Beers, over Tucker's jewelry store, are now making a specialty of filling the fangs of dead Teeth, and building up broken crowns with pure gold—thus restoring them to their original usefulness and beauty. They are also using Nitrous Oxide for the painless extraction of Teeth, when so desired—the only absolutely safe anesthetic ever discovered. In breathing it, it acts as a gentle stimulant, without undue excitement—the sensation produced being truly delightful, the effect upon the lungs healthful, and in its results positively free from all danger. Prepared and administered daily at the Dental Rooms of Messrs. JESSUP & BEERS, corner Montgomery and Sutter streets, San Francisco. 16v16-1f

CO-OPERATIVE UNION STORE.—This is becoming one of the most useful institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions 20 per cent. cheaper than ever before, and the very best articles in the market. The store is located at 115 Sutter street, Lick House Block, San Francisco. 6v16-1m

American, Waltham, Watches—The Best, The Cheapest.

Recommended by Railway Engineers, Conductors and Expressmen, and the most exacting class of watch-wearers, as superior to all others for strength, steadiness, accuracy and durability.

Unscrupulous importers occasionally place a worthless Swiss imitation in the market. To avoid imposition, the purchaser should invariably demand a certificate of genuineness.

For sale by all respectable dealers.

BRASS AND BELL FOUNDER

Cor. Mission and Fremont sts.,
SAN FRANCISCO.

Manufacturer of Brass, Zinc, and Anti-Friction or Babbot Metal Castings;
CHURCH AND STEAMBOAT BELLS,

TATERN AND HAND BELLS AND GONGS,
FIRE ENGINES, FORCE AND LIFT PUMPS,

Steam, Liqueur, Soda Oil, Water and Flange Cocks, and Valves of all descriptions, made and repaired. Hose and all other Joints, Spelter, Solder, and Copper Rivets, &c. Gauge Cocks, Cylinder Cocks, Oil Globes, Steam Whistles,

HYDRAULIC PIPES AND NOZZELS

For Mining purposes, Iron Steam Pipe furnished with Fittings, &c. Coupling Joints of all sizes. Particular attention paid to Distillery Work. Manufacturer of "Garratt's Patent Improved Journal Metal."

33v Highest Market price paid for OLD BELLS, COPPER AND BRASS. 6v1

WATER-PROOF BLASTING FUSE,
MANUFACTURED BY
THE BOSTON FUSE COMPANY.

This superior article gives great satisfaction to miners, and is sold at LOW PRICES.

33v The No. 2 exactly fits the caps used by the GIANT POWDER CO.

FREEMAN, SMITH & CO.,
Agents for the Company,
19v16-3m 110 California street, San Francisco.

The Giant Powder Company

Is now prepared to fill all orders for

GIANT POWDER,

Packed in boxes of 5, 10, 25, and 50 lbs., either loose or in Cartridges of 1/2, 3/4, 1, and 1 1/2 inches diameter. Each package contains one size Cartridges.

Orders to be addressed to the

General Agents,

BANDMANN, NIELSON & CO.,

23v16-3m 210 Front street, San Francisco.

SURE CURE.

I PROMISE TO CURE RHEUMATISM, NEURALGIA, Gout in the Feet or Ankles, Dyspepsia, Piles, Malaria, Bone Pain, and all kinds of Sores, in men or animals, and no matter how long standing. Also, Heart Disease, Sore Eyes, Sore Throat, Scrofula, Salt Rheum, and all Skin Diseases. Secret Diseases of all kinds cured. DR. JAMES BROWN, No. 34 Broadway, between Sansome and Montgomery streets, San Francisco.

33v I also promise to cure horses sprung in the knees. Remedies sent by mail. 6v16-3m

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

Alpine County.

Markleeville *Miner*, June 13th: The ledge in the Gould and Curry claim of the Pittsburg Co. is improving.

The I X L mine is now turning out more ore than ever before. The large body, or increase of size of vein, continues, and with an increase of force, matters about the mine begin to assume a lively appearance.

This week a large body of water has been struck in the Lateral tunnel of the M. C. M. Co., and the quartz is looking better than ever before. As depth is gained, the character of the ore vein gradually changes for the better.

We examined a sample of a few pounds of the first-class ore now being taken from the Morning Star, which the Supt., Mr. Seaman, sent to the office in San Francisco this week, and must say it beats even the black ore of the old pocket found in the upper level. It is the purple or violet ore which Mr. Graff found to be the most valuable of any class in the mine, and Mr. S. assures us there are large quantities of it now coming out.

The rock in the Mountain tunnel remains unchanged, though two small streaks of quartz, a few quartz pockets and a little accession of water struck a few days since, gave promise of a change.

Chronicle, June 13th: Supt. Barnes, of the Billy Rogers claim, has arrived and will soon commence work on the claim.

Yesterday we were shown a beautiful specimen of crystallized quartz from the Mountain tunnel, which has this week run through several strata of this character of quartz.

As soon as the Big Tree road is open the machinery for a quartz mill to be erected on the Rosalinda claim, a few miles from this town, in the Mokelumne District, will be brought over.

Calaveras County.

Chronicle, June 20th: Mr. Shaw, Chili Gulch, is doing a large business in the way of moving dirt. He uses 150 inches of water with a large fall, and is moving a bank from 60 to 90 feet high, by the acre.

Quartz prospecting is being carried on with much energy in this vicinity, and we are glad to say, with flattering indications. There is but little doubt but what this is the best quartz locality in the Southern mines. Staples & Co. have drifted from their shaft through the wall rock, and opened a large lead, from which they are taking excellent rock.

The Obili Gulch correspondent writes: There are now being worked in this vicinity several good gravel claims; the Coffee Mill claim and the claim of Messrs. Paul & Co. are the most promising. The former is situated on the side of the Golden Gate ridge, and is worked by means of an incline tunnel about 400 feet in length. The machinery and pumps are worked by a small but powerful steam engine, which, from its diminutive size, is called the Coffee Mill, and the claim goes by the same name. The claim of Messrs. Paul & Co. is worked by means of a tunnel, which has been driven through solid granite rock over 800 feet. It required the labor of six men, night and day, for nearly four years, to reach the gravel deposit where they are now working, and which pays handsomely. The hydraulic claim of Mr. Martin, at Red Hill, is also doing very well, although it is expensive to work. The gravel is intersected by horizontal layers of lava, very hard, and not easily cut or broken by the water. Mr. Martin has found it to his advantage to cut these strata of lava, by means of drifts, before working upon the bank with water. The ground being thus loosened, is easily caved and run off through the flumes.

The Camanche correspondent writes: Sand Hill and Crout Point are being worked to better advantage than ever before. Flagg, Jacobs & Co., have run a tunnel for several hundred feet, which opens to them a valuable claim, and fair prospects for a fortune. They have washed only sufficient to get a face on their works.

Messrs. Kennedy & Morrow have opened a claim at the lower point of Sand Hill. No great strike is expected from this mine.

Eldorado County.

San Andreas *Register*, June 20th: The El Dorado correspondent gives the following items: The mining prospects, wherever I have been, or have heard from, are flattering.

I heard of a new quartz discovery near Sheep Ranch, which was spoken of very

highly. The Whisky Slide quartz mine is not worked at present, but I understood that the company intended to commence operations before long. I also understand that the miners on Nigger Gulch and vicinity, have been taking out a large amount of gold dust, and are still doing well.

Humboldt County.

Yreka Times, June 13th: We understand that exceedingly rich diggings have lately been found on New River. In the progress of working some of the claims in that locality, a deposit of gravel has been struck which is said to be of extraordinary richness.

Inyo County.

An Independence correspondent writing to the Anurora (Nev.) *Union*, under date of May 31st, says: The miners in the Alabama placer mines have got thoroughly to work, and have made from \$10 to \$50 per day to the hand—or an average of about \$30—and if water was more plentiful in the district, more paying claims might be found in the same locality.

The arastra mill at Bend City is running steadily on rock that averages about \$40 per ton. The Silver Sprout Co. are at present engaged in building a large reverberatory furnace for the better reduction of their ore.

The mines at Fish Springs are still looking good, and very rich rock is being taken from the different ledges. Parties interested there are engaged in building a wagon road between their mines and mills.

New discoveries of rich ledges are being made daily in the Cerro Gordo mines, and considerable action is taking place in regard to the old discoveries in that district.

Klamath County.

Humboldt Times, May 30th: The mining prospects of Klamath County are unusually promising for the present year. At Orleans Bar, a company is in process of organization for the purpose of hiring the waters of Camp Creek on the Bar. The length of the canal and flume that will be required will be not far from eight miles, and all along the line of it is good paying ground.

At Happy Camp on the Upper Klamath, a large number of miners are at work, and the claims are all paying well—some largely. A company of San Francisco capitalists have brought water to the Camp, opening a large district of placer diggings that have heretofore laid idle, and but for water were worthless.

A good account is also given of the business and mining operations at Sawyer's Bar. The Black Bear quartz claim still continues to yield largely.

There is no doubt in the world but that Klamath County to-day presents as good a field for the industrious miner as any in California, and by far better than many of those to which thousands flock hundreds of miles away, and thousands could find locations within its limits that would pay.

Mariposa County.

Mail, June 19th: Placer mining in this county is often pronounced a "fizzle," "played out," but reports from various portions of the county convince us that much remains untouched, and that there are many rich and virgin fields only awaiting sturdy arms and persevering picks to disclose their hidden treasures. We are credibly informed that on King's Gulch, this side of the Fresno, there are claims now being profitably worked, and yielding a quality of gold, worth (as per assayer's return) \$19 per ounce. There are several other gulches in the immediate vicinity of the above, in which flattering prospects of coarse gold have been obtained, but owing to a scarcity of water they have not been thoroughly prospected. We are told that Mr. Hayden's claim has produced nuggets weighing \$15. Our informant states that the claim of Mr. Jeffries is also being very successfully worked.

Gazette, June 19th: From Hite's Cove we have the following: Hite & Co. are progressing finely with their new mill of 20 stamps. The foundation timbers are all laid, the mill house is up and roofed at this time; the batteries will all be framed ready to raise by the end of this week. The machinery is on the way from San Francisco and is expected every day at Mariposa. The company have an excellent foundation above the highest water mark. The mines continue to yield rich rock, and the team is constantly hauling it to the mill. Everything will be in running order by the first of August, provided there is no delay in materials. A spawler will be added to the mill for preparing the rock for the batteries.

Nevada County.

Transcript, June 20th: T. W. Sigourney yesterday bought three-eighths interest in the Italian mine. The controlling interest is now in the hands of J. J. Ott, who owns

one-half, and we understand they will soon put up machinery for the purpose of developing the mine. The old company got first rate prospects, but were compelled to suspend operations for want of capital.

Dr. D. C. Temple, of Omega, offers for sale what is known as the Temple & Creamer mining and ditch property, at Omega. It includes 70 gravel claims, 100 feet each; eleven-twelfths of the Diamond Creek ditch, one-half of the Missouri ditch, and three-fourths of the Edward's ditch. The three ditches run about 1,000 inches of water per day of 10 hours.

A new level has been opened on the Grizzly mine 125 feet deeper than heretofore reached, and below the surface water. The rock has greatly improved and will, it is estimated, pay \$30 to the ton. Mr. Clark will start up the mill and test the value of the ore fully by working, and if it proves as good as the prospecting indicates, 20 more stamps will be added to the mill before next winter.

Grass Valley *National*, June 19th: A few loads of rock has been taken from the Osborne Hill mine which looks splendid, and shows considerable free gold diffused uniformly throughout the mass. The yield is about \$90 to the ton, of that already taken out, and men are now engaged in sinking further. More workmen will be added in a few days, and it will not be long before the mine pays handsomely.

Gazette, June 23d: A blast of 240 kegs of powder was let off in the cement claims of Western, Holmes & Co. at Gopher Point, near Blue Tent, last Saturday afternoon. An immense amount of earth was dislodged by the shock, enough to keep the claim going all summer.

Grass Valley *Union*, June 19th: The custom mill belonging to Ben. Macauley in Boston Ravine, is constantly employed on custom work, and so good is its reputation among prospectors that its services are always engaged in advance. The Idaho will have another crushing put through this mill next week, the rock looking fully equal to that of their last crushing, which yielded \$35 per ton without counting the valuation of the sulphurets saved. These sulphurets, we are reliably informed, will yield at least \$500 per ton.

EXCELSIOR.—Virginia *Enterprise*, June 18th: The machinery for a second battery of five stamps has been purchased, and will shortly be put up in the Mohawk & Montreal mill. A large amount of excellent ore is already out, and when the mill starts up it will be kept running steadily. The backwardness of the season has greatly delayed all mining operations in Meadow Lake.

Gold Hill *News*, June 18th: Dr. Hiller, of Virginia, has just returned from a visit to Excelsior District, and reports matters in that elevated region flourishing as well as could be expected, considering the disadvantages under which the district labors at this stage of the season. The snow is melting off very fast, but is still from three to ten feet deep. The only mine actively working is the Mohawk & Montreal, which has been energetically operated all winter, developing a vast quantity of rich pay ore. The company have just got a new boiler from Sacramento, for their mill, and are adding five more stamps, making ten in all, besides which two new pans of the largest size and most approved pattern will be used. The mill will be in full operation by the middle of July, when rich returns may be expected, as the ore yielded under the stamps an average of over \$30 per ton last fall. Nothing was being done at the Enterprise mine.

Placer County.

Dutch Flat *Enquirer*, June 20th: Messrs. Kelsey & Co., owners of the Jehosephat, are now passing a large quantity of dirt through their sluices. A short time since they struck a mass of bluish cement and thoughts of the great ancient river channel immediately took possession of their minds, but as they piped the bank down, their blue gravel gradually passed away.

The Dutch Flat Co. cleaned up this week, after 14½ days' run, \$3,400.

The Messrs. Staples, of the Summersett claim have adopted an apparently novel method of working it. Finding it too hard at the bottom to be readily cut by their pipes, they have moved to the top of the bank and are now washing down, and the man who tends the sluices is about 200 feet below the one at the pipes.

Rablin & Co., owners of the Banner mine, intend to commence sinking a shaft on the mine some time the coming week, to endeavor to find the blue lead, which they are persuaded crosses from Thompson's Hill into Eastman's Hill, near that point. Last year they sunk a shaft to the depth of 27 feet and found plenty of cement of a bluish cast, in which gold was visible,

but abandoned the work for a time, but they intend to prospect it thoroughly this time. If they discover the lead at this point, enough ground will have been prospected to give employment, if properly worked, to thousands of men for years to come.

Auburn *Stars and Stripes*, June 18th: The Gold Run correspondent writes: Our miners are busily engaged in washing for gold and have good prospects of having water to wash all summer. The Home Ticket cleaned up last week and realized \$1,700. This was more than was expected, owing to difficulties under which they have labored. Moore, Taylor & Co., after a short run, cleaned up \$1,350.

We learn that the owners of the Mina Rica ("Rich Mine") ledge, on North Ravine, had 10 tons of rock from that ledge worked at Shipman's mill, last week, which yielded at the rate of \$53 per ton, after the rich specimens had been selected from the rock. The specimens taken from the 10 tons were worth \$500, making \$1,030 as the total yield. The ledge is about two feet thick, well defined with good walls, in slate, and the owners think they have a good thing. The mine is under the superintendence of Daniel Green. There is plenty more rock of the same quality in eight in the shaft.

Shasta County.

Courier, June 20th: A. McPhee informs us that the miners on the East Fork of Dog Creek are doing unusually well at present, and are demonstrating that the diggings are not near worked out.

Tuolumne County.

Sonora *Democrat*, June 20th: Lawrence Gooldee and Samuel Allen have struck a rich claim on the hill between Algerine Camp and Lattimer's. It is above the ditch and the dirt has to be taken below the ditch, to be washed. Notwithstanding this drawback they made \$500 week before last.

Yuba County.

Marysville *Appeal*, June 22d: Work was renewed on the Sherman quartz ledge on Monday by setting the pump in operation. We understand that it is the intention of its owners to prosecute the work with vigor this summer. The Sherman ledge has produced \$30 quartz, and there is more of the same sort left.

ARIZONA.

Prescott *Miner*, June 10th: Favorable reports continue to arrive from the newly discovered quartz mining district northeast of Wickenburg. Work is being done upon some of the ledges, and the ore taken out is said to be very rich in silver. The locality of the mines, as near as we can guess, is not over 10 miles southeast of Walnut Grove.

COLORADO.

Georgetown *Miner*, June 4th: An assay from the Nuckolle lode made by Messrs. Burlingame & Moor, from ore taken from Mr. Stille's tunnel, gave the large yield of \$905.28 per ton. This assay was from a portion of the vein never before tested.

From Empire we have encouraging news. A great amount of prospecting and general activity in mining matters exists there at present. Mr. Munson of the Knickerbocker mill, informs us that in a half cord of ore from the Conqueror lode, treated by Andrew Mason in the mill named, yielded \$600 in gold per cord. Mr. Haskins is repairing the old St. Clair mill, and will put in a half dozen arastras for the treatment of surface quartz from Silver mountain. At North Empire four arastras are running on quartz from the Conqueror lode, with good results. A party, whose name we did not learn, is putting up machinery in the Vore & Allen mill.

A splendid specimen of ore that beats almost anything of the ore kind that we have ever seen, is on exhibition at the office of Judge Yates. It is from the Cliff lode, on Brown mountain, which is being actively worked and looks first rate. A new pocket of fine mineral has been struck in the drift on the Munsell lode, and Tom is feeling very good over it. Active operations upon many of the hitherto idle mines in this district have been resumed during the present week.

Central City *Register*, June 4th: Mining matters are not as bright in Ward District as could be desired, but are looking up a little. Several mills are running.

Mr. Wightman, of the Eureka Foundry, informs us that within the last 30 days he has fitted up 50 stamps not before in use. This shows a decided increase in milling activity.

The Kip mill is running steadily on second quality rock from the Bohtail, which yields from seven to twelve ounces per cord.

John T. Hendrick has made arrangements to purchase all the first class ore of the Terrible lode. He is to pay \$500 per ton for it. He has also arranged with J. W. Watson, to reduce the ores of the Brown lode.

The Barrett Co. are rapidly lowering the water from the Winnebago mine, which has accumulated during the suspension of work and the putting up of their engine.

Denver News, June 10th: Mr. Lowe, of Fairplay, came in recently to tell us that the Ten-forty lode at Buckskin, discovered late last fall, is a second Comstock. At 15 feet from the surface they have nine feet of ore—sulphurets of silver.

Some of the old Black Hawk boys are going to mining in earnest in the Medicine Bow mountains, at a place discovered by them two years ago. Nick Spicer and others will have three sluices running within a few days.

The Ni-Wot shaft, on the Columbia lode, Ward district, is reported to have caved in, doing considerable damage.

Central City Herald, June 3d: Mining matters at Empire are improving. Many of the mines, owing to their location, have not been worked during the winter months, but will now yield a good return. The Conqueror is yielding some very rich surface quartz, which Andrew Munson is crushing in the Knickerhocker mill. The surface dirt from this lode paid well to sluice, and the headings yielded from \$250 to \$300 in a stamp mill.

Thomas Hodgkins and James White have made a valuable discovery, which is yielding plenty of ore. Andrew Munson is saving over \$100 per cord from it in the Knickerhocker mill. A good run was made on Silver Mountain iron recently; two and a half cords of ore yielded 33 ozs. of gold. It was mixed with surface quartz before crushing.

The May lode, Mountain House district, is turning out large quantities of rich silver ore. The crevice is about eight feet wide, and the average of the ore is about \$100, though selected specimens will assay as high as \$700. A shaft has been sunk 130 feet deep. A level is now being driven 60 feet from the surface. The ore will be treated at the California works.

The fine stamp mill of the New York G. M. Co., Black Hawk, is now being run steadily on custom ores—30 stamps for the Clark-Gardner and five on ore from the Consolidated Gregory mine.

We learn that the parties who are working the Gilpin county tunnel, Enterprise district, have struck a fine vein of blue sulphurets and galena mixed, which averages 14 inches in width.

Mr. Teats has made arrangements to treat twenty tons of Hoosier ore at the California works. It will be hauled over the first of next week.

DACOTAH.

Sweetwater Mines, June 6th: The Buckeye State ledge, at Atlantic City, shows some remarkably rich ore that is full of free gold.

We were recently presented with some beautiful specimens of quartz from a new discovery on the Cariso ledge, which, for richness in free gold, we have seldom or never seen surpassed.

The Wyoming Ditch Co., after a run of two days, cleaned up last Wednesday, having taken out 25 ozs. of dust.

We hear very favorable reports from the placer claims on Rock Creek. Several companies have got thoroughly at work, sluicing with most favorable results.

Yesterday we were shown a specimen at the store of J. A. Gaston, taken from the Bohtail ledge, which, on the surface, was innocent of gold, but upon being broken open disclosed free gold in abundance. So "lousy" was it with the precious metal that everybody viewing it could scarcely believe their eyes.

In reply to the statement published generally on this coast, that the Sweetwater mines are a myth, the editor says: Notwithstanding the false reports, and willful misrepresentations, which have been circulated concerning our mines in this country, they fully come up to the expectations of all the experienced and sensible men who have come here, and taken measures requisite to ascertain for themselves the correctness of the statements, in regard to the richness and extent of the deposits of gold in this region.

Gold Hill News, June 15th: Hon. C. W. Tozier, ex-Speaker of the Nevada Assembly, writes from South Pass City as follows: The country has been very much over-estimated, and many exaggerated accounts of its richness have been circulated through the newspapers and otherwise, yet there is nothing here to go crazy over, or even get excited about. There certainly is a very large amount of quartz here, which will, so far as developed, compare favorably with the gold-bearing quartz of California, and which will some day be worked with profit, making this in due time a prosperous mining region. Of the placer mines nothing positive can be said as yet. The spring

here must come in autumn if ever, for it is winter yet, although work has been commenced on the creeks and gulches, to open and develop them. No definite results, however, have as yet been obtained, but the prospects are favorable for good average paying diggings; say from \$4 to \$8 per day, and this to a considerable extent.

IDAHO.

Owyhee Avalanche, June 13th: Webb, Myrick & Co. have resumed work on the south extension of the Morning Star. The water has been taken from the shaft on Jordan street near Webb & Myrick's bank. The shaft is already 50 ft. deep. Rich gold ore is known to exist there and doubtless it can be profitably worked.

On a recent visit to the Potosi dump, we saw some large pieces of ore which were covered with sheets of pure, bright, native silver. In other pieces could be seen free gold, and almost pure black sulphurets of silver.

MONTANA.

Post, June 5th: A correspondent writing from the Salmon mines, gives the following interesting items:

"Mining has fairly commenced" with plenty of water. The ground, generally, is paying far better than the owners expected last fall, and there are more good paying claims than was ever thought of at that time. The upper portion of Nappia's creek last summer and fall was looked upon as worthless, where to-day Douglas & Co. are making over \$50 per day to the band.

Then comes the Discovery Co., then Hart & Davis, all of whom are busy at work, and making over \$50 per day to the band. Ward's gulch, Bear Track, Sierra, Meadow Creek, Nip and Tuck, Home Stake, Smith's gulch, Arnett, and others are all paying equally as well, and some of them better. But we want men here. On Sunday last 100 men could have hired out at \$6 a day or \$7 a night. We have scarcely men enough to work the day "shift," and yet every one is anxious to work the ground night and day, if they can get hands.

New diggings have been struck on a bar of a stream emptying in the Lemhi River, that promise well. A new camp has also been struck between Leeshurg and Warren's diggings.

The First National Bank, on Wednesday, cast gold bars which weighed 1,682 oz., of the value of \$31,047 in gold coin, equivalent to \$45,000 in currency.

Last evening we were shown another huge brick of 800 oz., representing \$14,400 in coin and about \$21,000 in currency.

Twelve companies are working bed-rock flumes on Elk Creek, commencing on the discovery claim and running a distance of five miles. About 200 men are employed on the creek. The ground is yielding better than ever before and is sufficient in extent to furnish paying diggings for the next five years.

The Argenta Anaconda silver ledge is proving up finely. Some 12 or 14 tons of ore have already been extracted.

Mr. Esler has in his cupel, now undergoing the process of cupellation, something over 10,000 pounds of metal.

Some of the miners lately petitioning for rain are now praying for it to cease. Below town many have been drowned out, the water, of which there is now more than an abundance, in many instances washing into and filling up the pits and ditches. Some parties who have been stripping ground have had to quit on account of the inundation.

The St. Louis and Montana Co's mill is now running day and night. There are seven feet of solid quartz on the north end of the Hope lode that will average \$100 per ton.

NEVADA.

Aurora Union, June 13th: Several miners in from Bodie report mining operations to be in a flourishing condition. There are but a few miners in that camp at present, and the greater portion of them have been employed taking out ore and are now making preparations to crush in arrastras the ore they have now on the dump. Some fine ledges have been opened lately, and all are doing well.

Humboldt.

Unionville Register, June 13th: We are informed that the Golconda ore is now paying handsomely, and that Mr. Negus is clearing \$300 per day.

Robert McBeth and Geo. W. Fox have, at last, found a quartz ledge, the Little Giant, at Battle Mountain, which is undoubtedly one of the best in Nevada. They have been engaged for some months in developing and opening out their ledge, and the result is certainly gratifying. The first working of four and one-fourth tons of ore from the surface, yielded at the rate of \$187.77 to the ton. The ore was not so-

lected, for no eye could distinguish the rich from the poor. It was taken from the surface and hauled to the Negus mill at Fairview, treated and the crude bullion sent below, and the result returned properly authenticated. Since then they have been constantly bailing and working the ore with even superior results to this. The ledge is large and well defined, showing satisfactory evidences of its being a true and lasting vein, while any distinction in the character of the ore between the walls would be impossible. It has been visited by numerous competent judges, who all concur in its being one of the most remarkable metallurgical phenomena ever discovered. Experts have worked the ore for self-satisfaction by mill process in pans, and have never failed to obtain silver in astonishingly large quantities.

There is at present exposed to view in the Arizona mine, a sufficient quantity of ore to feed a 20-stamp mill one year. The ledge is $4\frac{1}{2}$ feet in width, and highly charged with the choicest ore. The new mill will be ready to start in about three weeks.

The Dun Glen correspondent writes: Our mines never looked better or really more prosperous than at present. The Humboldt Co. continue to take out very rich ore from the Monroe Series, which is sent to the Essex mill for reduction.

Same of June 20th: The mill belonging to the Montezuma Smelting Works has recently been at work reducing ore from the Chloride ledge in Trinity district, under the management of Mr. J. H. Atchison. The clean up, after a short run, was of the most gratifying character, the result being \$40 to the ton of ore.

During the last two weeks Mr. Nason has been reducing a portion of the immense quantity of litharge which has accumulated from the refining furnaces. One hundred and fifty tons of as fine lead as the market ever saw, is now stacked up awaiting transportation.

Reese River.

Silver Bend Reporter, June 13th: From Palmetto district we have the following: Work on the Kentucky is being vigorously prosecuted by double shift. The Champion at this time is producing daily from three to eight tons of No. 1 ore that with proper treatment will easily yield \$100 per ton. The company also have a 10-stamp mill in process of erection.

Just now the section known as White Pine is attracting unusual attention, and there are 200 men or upwards at work and prospecting in the locality. Many remarkable deposits of chloride ore have been discovered there which bid fair to speedily enrich the owners. We understand that the mill at Newark district is engaged in reducing ore from East White Pine which is yielding immensely. Thomas J. Tennant will erect a 5-stamp mill contiguous to the Pleasant Valley mines immediately.

Mr. Bright, agent of the Combination Co., forwarded yesterday to the Co's Treasurer in New York, 22 bars of bullion of the value of over \$21,000. The bullion averaged about 700 fine and made a fine show.

The mill of the Silver Peak and Red Mountain Co., Silver Peak district, will probably be running by the middle of July. Over 2,000 tons of quartz is now lying at the dumps of the Crowning Glory mine ready for transportation to the mill, which will yield an average of \$50 per ton gold.

A small lot of bullion was brought into town on Wednesday from Reveille district. It was from ore reduced in an arrastra by Brobandt & Co.

The Arizona claim is now supplying Antonio Borques' 3-stamp mill with all the ore it can reduce, and is paying well.

The Combination Co. are getting a large amount of ore of an excellent quality near the surface just north of and adjoining their upper works upon the Higbbridge.

A fine body of chloride ore similar to that upon Leon & Co's claim has been opened on the Belmont Co's El Dorado North. A quantity amounting to seven tons was recently worked and gave a pulp assay of \$152.50 per ton.

The Galvin mine, on Arizona Hill, is now furnishing some splendid ore, and at the depth of 90 feet the ledge bids fair to rival the more noted ones of the district.

Parties have leased the Quintero mine and are now taking out ore for reduction.

Same of June 17th: The Silver Bend Co. had a lot of ore lying upon their dump amounting to 75 tons, 11 tons of which were crushed last Saturday, and gave a pulp assay of \$192 per ton.

Reese River Reveille, June 10th: We saw this afternoon, at David Lundbom's assay office, two small bars of bullion, weighing 2,275 ounces, 970 fine, and valued at \$1,601. They were the product of ore from the Hidden Treasure ledge, in Treasure Hill, White

Pine district, reduced in the 5-stamp mill belonging to T. J. Murphy and others.

June 13th: During the week 60 tons of ore from the Buel North Star mine, were sent to the Manhattan mill for reduction, the pulp assay of which ranged from \$460 to \$520 per ton! We learn that a greater quantity will be sent to the mill next week. The ore is of the finest quality, and is entirely free from base metals.

There were produced at the Manhattan mill, during the week ending this date, 22,890 ounces of crude bullion, which were melted and assayed in the office of the establishment.

June 18th: The Knickerhocker mill, near Lone, is to be set in motion immediately, and a party of men left this city this morning for the purpose of working in the mill.

Champion, June 17th: The El Dorado South continues to yield its characteristic high grade chloride ore in undiminished quantity. The result of last month's work on this mine with six men was 122 tons of ore, 48 of which were selected to constitute first-class ore, and yielded \$276 per ton. 74 tons of second-class ore—the balance extracted during the month—yielding \$252.50 per ton. The force on the mine has been increased and will show a much better result this month.

Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

Virginia Enterprise, June 16th: We understand that the Empire Co., Gold Hill, have reached and are now cutting through the black dike in their drift from the 900-foot level of the Imperial-Empire shaft. In the level above the ore was found lying against this dike on its west side, and it is supposed that it will be found in the same position on the lower level. The work of hoisting ore will be resumed by the Alpha Co. in about a week. The Washoe smelting works are proving quite a success. The furnace of the company has a smelting capacity of five tons per day. They have ore that yields 60 per cent. of metal—lead and silver—and are at present engaged in erecting a refining furnace. When this is completed they will be able to separate the silver from the lead and mold it into marketable bricks. We understand that parties in Dayton intend giving the ores of the Whitman and other mines situated in Como another trial this summer.

June 17th: Nearly every mill in this city, Gold Hill, on the Carson and in the various canons, are in full operation upon ores from the various mines on the Comstock, in Flawery and Occidental districts and vicinity.

June 20th: Wells, Fargo & Co. shipped from their offices in this city and Gold Hill, during the past month, 9,079 pounds of assayed bullion, valued at \$263,246.92.

The Occidental Co. have let a contract for the running of a new tunnel 1,000 feet in length, starting at a point in a ravine several hundred feet below the dump at the mouth of their present tunnel.

The old Dick Sides hoisting-works are being removed to the Lady Bryan mine, Flawery district, where they will be set up and used in sinking a shaft.

June 21st: In the main shaft of the Sierra Nevada mine there are still 100 feet of water.

The drift from the Imperial Empire shaft is now some 20 feet into the ledge, with signs of ore in the face. The work is progressing slowly.

The Cole Co. have now out some 50 tone of ore from the rich deposit lately struck in their upper level, which will shortly be sent away to be crushed. They have worked down upon the deposit some 10 or 12 feet and find it to increase in width, it being now four or five feet wide.

Gold Hill News, June 15th: The repairs and general overhauling of the hoisting works of the Alpha mine, are nearly completed, and the machinery will be put into full operation, hoisting ore from the mine, in about a week.

June 16th: Numerous tons of selected ore are soon to be transported from the old Whitman mine, Indian Springs district, to Dayton for reduction.

There was shipped from Wells, Fargo & Co's Gold Hill office this morning, three bars of bullion, weighing 207 pounds, and of assayed value of \$5,715.16.

The Imperial Mining Co., Gold Hill, yesterday declared a dividend of \$6 per share, payable on the 20th inst.

An assessment of \$4 per share was levied yesterday on the Ophir Co.

June 18th: No great strikes of rich ore have been made as yet in either of the west drifts from the 900-foot level of the new shaft. Several small rich streaks have been encountered, however, and other indications of something good not being far off.

Mining and Scientific Press.

Canvassing Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. A. C. KNOX, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1866.

Mr. C. T. RANEY is our duly authorized agent for Sacramento County. Nov. 23, 1867.

Dr. J. C. YATES is our duly authorized traveling Agent. July 6, 1867.

Mr. A. B. BUTLER is a duly authorized traveling agent for this paper. July 15, 1867.

San Francisco:

Saturday Morning, June 27, 1868.

Notices to Correspondents.

SALAMANDER.—The phenomenon of the rolling spheroids of water, when a small quantity of that liquid is spilled on a highly heated stove or other surface, has been termed by Boutigny, as the spheroidal state—a term that has been adopted by his co-scientists. It was first described by Leidenfrost, but more carefully examined by Boutigny. If a good conductor, (a sheet of metal is the best for this purpose) be heated to between 300° and 400° F., and water be allowed to fall upon its surface, the liquid does not enter into ebullition; but instead of moistening the surface, as usually occurs, it rolls about in spheroidal masses. The temperature of such spheroids never rises to the boiling point of the liquid experimented with. If the source of heat is removed, the temperature will fall until a point is reached, at which the liquid will suddenly begin to boil vehemently, and disperse itself in all directions with a violent hissing noise.

O. J. Alleghany, Sierra County.—Your query with regard to the "coloring matter" of a certain mineral (Mariposite) has already been answered. We have not a specimen of gold-bearing diorite at hand, but will endeavor to procure one and forward to your address. Diorite is a trap rock, similar to the ordinary greenstone met with in most of our mining localities. It is usually crystalline, but sometimes compact. The difference between diorite and greenstone consists in the presence, in the former, of albite in the place of feldspar, which exists in the latter. Albite is so named from *Albus*, white; it is much whiter than feldspar, but otherwise closely resembles it. The constituent difference between albite and feldspar is in the relative amount of potash and soda which they respectively contain. Feldspar usually contains about ten per cent of soda, with a mere trace of potash; while albite usually contains about ten per cent of potash with a mere trace of soda.

J. C. La Porte, Sierra County.—The specimen which you forwarded to us accompanied by a note, from its general appearance seems to consist merely of a crumbly aggregation of pure sand, and was probably so purified by the infiltration of water which has carried off the original accompanying ingredients, as oxide of iron, etc. It may, however, have originated as a silicious precipitate. If we were made acquainted with the mode in which it exists *in situ*, we would more understandingly be enabled to form an opinion of its origin. To ascertain its exact component parts would require a troublesome analysis. From the appearance of the sample forwarded, we think it might probably prove a very desirable sand for making glass.

EXPERIMENTER.—In the intermixture of gases, the diffusive volume has no necessary relation to the chemical equivalent or atomic weight of the compound or simple gas; for it has been observed, that the rates of diffusion are dependent upon the relative density of the gases compared, quite irrespective of their combining proportion. In liquids, a similar disconnection is found to obtain, between the chemical equivalents and the diffusive volume.

DARIEN SHIP CANAL.—Our correspondent from Hornitos, who makes inquiries about the Darien Ship Canal, shall be fully answered in our editorial columns next week.

Manufactures as a Means of Wealth.

Manufactures are the surest means of wealth to any nation. The grand effort of all who desire to build up a State, and render it permanently prosperous, should be directed to the encouragement of "Home Manufactures." It is to manufactures and commerce that England owes her wealth and power. English statistics show that the percentage of profits on capital invested in manufacturing enterprises, greatly exceeds the same amount of money invested in agriculture or any other enterprise of national extent. The New England States of our own country also owe their remarkable prosperity to their manufacturing enterprise. The same is true of the Middle States. The great West is prosperous, but only for the reason that she feeds the manufacturing population of the Eastern and Middle States. Agricultural communities are nowhere sufficiently prosperous to accumulate wealth to any considerable extent, except where they are the immediate neighbors and feeders of enterprising, manufacturing and commercial countries.

We last week devoted a column to discussing the new tendencies of manufacturing enterprise, showing that the policy which has hitherto obtained of separating agriculture from manufactory industry—of devoting barren and sterile regions of country exclusively to the latter, is no longer applicable to the present advanced condition of the arts. The introduction of steam and cheap fuel, now enables us to take our workmen into those regions where the cheapest food, and consequently the cheapest labor, can be found, instead of to barren regions with no advantages but rocky ridges plentifully supplied with waterfalls.

These facts should be carefully noted by San Francisco capitalists; for under such conditions this city must become the center of the manufacturing industry of the Pacific Coast. Cheap food, cheap labor and cheap fuel, are, and ever must be, concentrated here. Plentiful as may be the water power of the mountains, it can never compete with steam on the sea coast. The facts cited by us last week are conclusive on this point.

Thousands of laborers are now pouring in upon us, mostly from the crowded cities of Eastern industry. What shall we do with them? We want them here; they wish to come. To keep them and encourage a continuance of such immigration, we must find employment for them. We have already shown that this city is the place to furnish that employment. True, we have an abundance of land where many may go; but our foreign market for grain is not always sure. We must create a home market. How can we do this? Only by the establishment of home manufactures. Our distance from other manufacturing centers is a full offset for the increased cost of fuel here. The considerations which we urged last week, and which are being accepted by Western capitalists, are especially applicable to California. Food can be produced in this country for a less amount of labor than in any other part of the world, and there is no reason why we should not be exporters instead of being importers of manufactures.

We are not proposing an untried experiment. For many years the mountains of California yielded fabulous amounts of gold; but where did it go? How small a proportion of those millions wrested from our soil and rocks by the hard labor of our miners, remained to enrich the State? California enriched the world, but remained poor and impoverished herself. Everything that we consumed came from abroad, and the very ships that brought it were built, owned and manned by people abroad. We had no agriculture, no commerce, no man-

ufactures of our own. We simply dug gold and sold it for food and clothing. It took just about all we could dig to feed and clothe us; very little was laid by for our future wants.

By and by the happy thought occurred that California soil might yield something else than gold; a few enterprising persons engaged in agriculture; the experiment succeeded and the business increased until California now sends immense annual fleets, loaded with wheat and flour, to feed the manufacturing people of our Eastern States and Great Britain.

The same experiment was subsequently tried in manufacturing industry—cautiously at first, but gradually enlarging and extending—until our manufactures now amount to many millions of dollars annually. Woolen and cotton goods, boots, shoes, candles, fuse, barrels, buckets, boxes, cordage, chemical materials, oil, paper, powder, pickles, starch, soap, flour, furniture, carriages, brooms, wines, building materials of every description, of wood, iron and marble, machinery of all kinds, etc., etc., are now counted among our home manufactures. All these branches of manufacture, we are happy to say, are steadily gaining ground. We have laid the foundation for a magnificent future; we have ample materials at home, cheap food, plenty of labor seeking our shores, and a fair prospect of an ultimately low-priced supply of fuel; and we have as good mechanics and artisans as the world can produce.

By this fortunate change in our industrial programme, we are now keeping at home millions upon millions of gold that formerly went eastward. Capitalists are beginning to see and acknowledge this beneficial change; but our commercial reports still show, by their voluminous lists of "Merchandise on the Way to this Port," that there is yet room for further investments in this direction; that many more millions of dollars might be saved to the State; and that there is no present danger that we shall be "too fast" in the development of our manufacturing enterprises. Nor will there be any danger in this direction until we cease importing, and turn the current the other way.

We are talking a great deal, at this time, about encouraging immigration to California. The best way to effect that is to create a demand for labor; no immigration will be healthy without such a demand. Forced immigration will soon put a stop to our increase from abroad. Every man that comes here and fails to find employment will, by his letters, prevent his friends from following him. On the contrary, every man that finds employment and sees the same for others still, will become voluntarily an active immigration agent, who will be far more effective than one specially commissioned and paid for that duty. The good effects of our "Labor Exchange" will soon be felt abroad. When it is universally known that the demand for labor in San Francisco is greater than can be supplied by a free Labor Exchange, two lines of weekly steamers and daily railroad trains from New York will scarcely be able to satisfy the demand for passenger transport to this city. Every appearance indicates that with the opening of the overland railroad there will commence a rush of immigration to this coast, fully equal to that of the early years of the gold discoveries. Let our capitalists see to it that employment is furnished for the needy and willing hands that are coming. It will pay in a two-fold manner—by the increased value it will give to real estate, and by the direct profit on the employment of such labor in manufacturing enterprises. All cannot find employment in agriculture. We must create a home demand for agricultural productions to increase that branch of industry even much beyond its present limits. Let our capitalists bear these facts in mind, and

prepare in season to meet the emergency we all so much desire.

California, and especially her commercial emporium, occupies a position unrivalled in natural advantages in the entire circuit of the globe; but we can never attain our natural destiny except by a proper exercise and improvement of our advantages. We must first make ourselves as independent as possible of the world, by our home productions; then we may aspire to a high and important control of its commerce. The idea which has been shadowed forth of our future is a gigantic one. "Time was," says a late European writer, "when a small island in the sea sufficed for the commerce of the civilized world. Then came the Atlantic. Now, the vast Pacific alone will content us, and the Paradise of wealth and the golden age of commerce, which the past persisted in placing in the East, is rolled over to the West." We of the present day will soon be witnesses to the fact that civilization and enterprise has completed the circle of the earth, and that the Pacific Ocean has become the Mediterranean sea of the world!

Exhibition of Minerals.

It is especially desirable that the exhibit of ores, precious metals, minerals of every variety, fossils and curiosities, at the Mechanics' Fair for 1868, should prove worthy of the vast and rich mining field represented. To forward this object we have concluded to gratuitously take charge and properly exhibit all cabinets and specimens which may be sent to our care, with instructions. Full information should be sent with each parcel, as we desire to publish a catalogue list in the Press of all that is received. Packages must be prepaid, and advices sent by letter in the mail or express. Address, DEWEY & Co., Mining and Scientific Press, S. F.

OREGON IRON.—A small sample lot of iron was received in this city, last fall, from the Oregon Iron Works, which was distributed among several of our foundries, where it gave very general satisfaction as to quality. During the present month, two regular invoices of this iron have been received, and in all, 1,000 tons are ready to come forward. The company evidently mean business, and will hereafter make regular shipments to the full capacity of their works. The manufacture of pig iron on this coast is a want which has long been felt, and although this establishment will be able to supply only a small portion of the demand, its successful inauguration will eventually lead others into the same manufacture, until we shall be placed quite independent of the East for this heavy and important item of consumption. The rolling mills of this city are nearly ready to go into operation. These two enterprises will form important additions to our rapidly increasing industrial productions. Their successful establishment will make still more apparent our need for converting furnaces, so that we may make our own wrought iron and steel. Each will be dependent upon the other, and will unite in a demand for a thorough examination and development of our immense natural resources for the production of raw iron. The time is not far distant when we shall manufacture the chief portion of our steel, and all our iron—bar, railroad and pig—from our own mines.

COLLAPSING HOOP SKIRTS.—At the Mechanics' Fair, in Springfield, Mass., last February, one of the novel inventions exhibited and favorably reported was Brewster's "Eureka" self-collapsing hoop skirt. It has the appearance of being just the article desired for ladies' wear in crowded places—cars, carriages, arm chairs, etc. We would advise some of our enterprising merchants to correspond with the owners of the patent right, Messrs. Labaree Bros. & Co., Springfield, Mass., and make a "hit" by introducing the new article in this State.

The Botany of California.

It will be perceived from the following letter from Professor Brewer, that the expected work on the Botany of California, upon which that gentleman has been for several years engaged under the direction of the State Geological Survey, will not be withheld in consequence of the refusal of the Legislature to continue that survey. The Professor has determined to go on with that work, as "a labor of love." The botanical field of California is one of unusual interest, and the world of science will be greatly indebted to Professor Brewer for the determination hereinbelow expressed:

EDITORS OF PRESS:—I have lately received several letters of inquiry from your State, relating to the volume on the Botany of California, which I am preparing. These letters I ask leave to answer through your paper. I have not been able to confer with Professor Whitney since the action of the State Legislature pertaining to the Geological Survey, and do not therefore know the exact state of affairs; but I wish to state that I still intend to get out a volume, descriptive of all the plants known in the State. The work of its preparation is a vastly greater one than I supposed when I began it; but I expect to carry it through, and am at the present time hard at work at it. It is a "labor of love," pursued for science's sake; for even should I get the amount I had expected to receive for it, the sum would not pay the actual expenditure of money I have made, and must make to complete it, much less to compensate me for the labor it costs. No fears need be entertained that the work cannot be published when prepared, even though the State lacks the necessary public spirit. I hope to be able to do it at my own expense; if not, it is of sufficient interest to science for learned societies here or in Europe to publish it. I have already received offers to this effect, but shall not accept such, unless as a last resort. Yours truly,

WILLIAM H. BREWER.
Cambridge, Mass., May 30th, 1868.

A MACHINE shop is to be built at Mansfield, Ohio, to have a capacity for the production of 15,000 threshers and separators annually.

NORTH AMERICA

Life Insurance Company.

NOTICE TO THE TRADE.

Screwed Boots,
Screwed Boots,
Screwed Boots,
NO MORE TO BE MONOPOLIZED.

Capitalists who control Boot and Shoe Factories at present monopolize the trade, on account of the price of the American and French Screw Apparatus, each costing from one hundred and twenty-five (\$125) to four hundred dollars (\$400), leaving them out of the reach of the poor man, whilst LUMSDEN'S CALIFORNIA APPARATUS

For the Making Up of Screwed Boots,

Patented May 26, 1868,

Is sold from \$33 to \$50.

—in 20 minutes' application it can be learned.—

With this cheap and valuable invention, Boots and Shoes can be made on lasts, with or without being iron-plated. Every bootmaker now doing business on the Pacific Coast can have one. The apparatus is small and strong, and with care will last a life time.

Each one is warranted. Orders promptly attended to.

Work done at the Vulcan Iron Works.

For particulars apply to

NICHOLAS LUMSDEN, Inventor,

HENDY'S LATEST IMPROVED PATENT SELF-DISCHARGING SULPHURETS CONCENTRATOR.

FOR GOLD AND SILVER ORES,

With Revolving Stirrers and Rotary Distributor.

Can be seen in operation at the Union Iron Works, corner of Mission and First streets. This machine is designed for saving finely divided Quicksilver, Amalgam and Gold from the sands, and for concentrating and saving the Sulphurets. Any person of ordinary experience with Quartz Mills can readily fit them up and run them.

Those in want of Concentrators would do well to visit some of the quartz mills that have Hendy's Patent Concentrators in use, and satisfy themselves before purchasing other Concentrators or pretended merit. THEY ARE WARRANTED TO WORK SATISFACTORILY.

Directions for Operating Hendy's Concentrators:

The sulphurets are drawn off while the Concentrator is in motion, in the following manner:
FIRST—In setting up, set the pan, A, level by the inner rim, near its center.
SECOND—While in operation, keep the Pan, A, about half full of sulphurets. [See Figure 2, marked S.]
THIRD—Open the gate, E, sufficiently to discharge the sulphurets as they accumulate over the amount above mentioned.
FOURTH—The crank shaft to make 200 to 220 revolutions per minute.

References:

Reference is made to the following mills, which have HENDY'S CONCENTRATORS in use:

EMPIRE MILL. (8 Concentrators).....	Grass Valley, Nevada County.
NORTH STAR M. & M. CO. (8 Concentrators).....	Grass Valley, Nevada County.
NORRIDGEWOCK MILL. (2 Concentrators).....	Grass Valley, Nevada County.

JAMES HENTY & CO. (1 Concentrator).....	Melbourne, Australia.

And in use in many other parts of this coast.

The following give additional proof of the increasing popularity of the machine:

SAN FRANCISCO, October 10th, 1867.

J. HENDY, Esq.—Dear Sir:—To your request for an expression, in writing, of my opinion in regard to the merits of your Concentrator, I reply, that I consider it the best machine for saving quicksilver and amalgam, and for concentrating sulphurets, that I have ever used, or seen used. I may add, that I could give you no stronger proof of this than to order, as I did, six more of them, after a trial of one for several months. I shall take pleasure in showing the machine in operation to any one interested, who will call at the mill of the Empire Company, in Grass Valley. Yours,

S. W. LEE, Supt.

NORTH STAR MINE, Grass Valley, Feb. 26, 1868.

J. HENDY, Esq.—Dear Sir:—In answer to your request, I give my opinion in regard to the eight Concentrators we have at work. We have had one at work on blanket washings for the past three months, and it has proved highly satisfactory in saving sulphurets and amalgam, that in past years we have been losing. Of the other seven, six are taking the pulp from the batteries, and the remaining one concentrating from the six, which, when thus reconcentrated, yield 95 per cent. of pure sulphurets. Respectfully, etc.

W. H. RODDA, Supt.

An Additional call for Hendy's Concentrators

Has just been complied with, and the machines shipped to Grass Valley, Nevada Co., Cal., viz: One machine for the Empire Company, and two for the North Star. Hendy's Concentrators have been in constant use in these mills for more than eight months, and these orders completed a set of ten machines for each mill. The North Star Company have just added eight new stamps to their machinery.

Four Concentrators have been forwarded to the Vulture mine, in Arizona, which makes eight for that mill. The additional order for four machines was made after a thorough trial, which proved their superiority over all others. [See Mining and Scientific Press of Dec. 14th.]

CAUTION.

All of HENDY'S PATENT CONCENTRATORS are marked thus:

"J. HENDY, Patented April 17th, 1866, and May, 15th, 1868."

California Pioneer Fuse

MANUFACTURING COMPANY,

MANUFACTURERS OF

HOSE AND TAPE FUSE,

A New and Superior Article for Blasting in very wet ground, or under water.

Great difficulty has heretofore been experienced by miners, and others in the use of Fuse, which has been subjected to deterioration from exposure to dampness during transportation, or during the great length of time which has passed between its manufacture and use. In addition to great painstaking in the manufacture of the California-made Fuse, the above and many similar objections are entirely obviated, and the operator can always depend with certainty upon the burning of his fuse.

It is often the case that extra lengths are required, as exploding tunnels, etc., longer than is furnished in the imported article. Fuse of every desired length or size can be made to especial order, at the above manufactory.

Manufactory, - - - Potrero, San Francisco.

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1865, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING. 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, \$125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are various and expensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y16p

13v16-3m **H. C. BENNETT, Secretary.****HOT CAST PORCELAIN.**—Our readers will
recollect the notice given in a former article
of this new manufacture, the basis of which
is the cryolite, imported from the Greenland
coast. The following is from the New York
Journal of Commerce: "This new material is
not only extremely beautiful and very
closely resembling the porcelain imported
from France, but it is as strong as ordinary
quensware, or what is commonly called
stone china. It is capable of being rapidly
formed, while in a state of fusion, into all
the various articles of household use, such
as cups, saucers, plates, and dishes for the
dining room, as well as the less elegant
dishes and vessels for the kitchen and cham-
ber. It is also exceedingly well adapted for
tilings and floorings, and combines elegance,
cleanliness, and durability with cheapness,
costing so little comparatively with the en-
caustic tiles of foreign manufacture that an
elegant and permanent flooring may be had
for almost the price of Brussels carpeting.
It may also be substituted for window
panes, gas globes, and shades, admitting a
beautiful mellow light, and presenting as it
does a very highly polished surface on both
sides, such as will be free from the dust
which continually gathers upon the rough-
ened sides of ground glass. It is also ap-
plicable for photographic purposes, and for
architectural uses, as it may easily be
adapted or worked into any form or thick-
ness into which glass or iron can be molded.
Nor does it change color, as it fully resists
the action of the atmosphere, being per-
fectly weather-proof, which quality makes
it preferable to marble even for purposes
of interior use and decoration, as for the
exterior of buildings, where beauty, strength
and permanence are required. For wash-
boards, table-tops, mantels, brackets, and
such like it is invaluable, presenting as it
does a surface easily kept clean, and bril-
liantly polished. Considering its great
strength, the beauty of finish of which it is
susceptible, and the multitude of purposes
and form in which it can be used, this
new material is likely to occupy a wide
field."**FLEXIBLE MOLDS.**—Gelatin molds are
made for plaster castings when the details
are of such a shape that it would be im-
possible to get the casting out of the mold
when the last was not elastic. To make
them, soak glue in an equal quantity of
cold water (by weight), a little more or
less, according to the quantity of your
glue, which has to be found out by trial.
The glue will, after eight or ten hours, be
swelled and have absorbed all the water;
then melt the mass by a moderate heat and
cast your mold. Put it in a cool place for
at least twelve hours before attempting to
take it out. With such molds, when care-
fully oiled before each casting, thirty or
forty castings can be taken; or Canada bal-
sam, a solution of india-rubber in benzole,
may be added to the glue during the melt-
ing and incorporated by stirring; this will
cause the mold to withstand the action of
water better. Some glycerine added will
prevent it from drying out so soon as it
will when made out of simple glue. Some
persons add also molasses to it, and make
then a material very similar to the common
printer's roller.**THE AMERICAN IRON AND STEEL INTEREST.**
A third effort is now being made to repeal
that clause in the Pacific Railway laws
which requires the constructors to use
American iron exclusively. Senator Pom-
ero, President of one of the corporations,
made an effort in the Thirty-eighth Con-
gress to have the clause repealed, that they
might import all the iron used if it was
thought expedient. Senator Sherman made
a similar effort in the Thirty-ninth Con-
gress, but both failed. Joint resolution
263, which has passed the House, and has
just been referred to the Senate Pacific
Railroad Committee, declares that the law
"shall be so construed as to make it neces-
sary to use American iron only for all nails,
chairs, fish-bars, bolts and spikes," leaving
the corporation at liberty to import the
rails and other iron for the roads for their
entire rolling stock, and all their Bessemer
or other steel, for any purpose, including
rails.—*Washington Cor. Ledger.***ELECTRO-MAGNETIC MOTOR.**—A novel en-
gine, driven by electricity, was exhibited
before a large and intelligent audience at
the College of the City of New York on
Tuesday afternoon. If the "electro-mag-
netic" engine can be brought to do all its
inventor claims for it, the days of steam, as
a motive power, are numbered.—*Iron Age,*
May 21st.It is stated that fully eighty per cent. of
the Atlantic Cable receipts comes from the
American side.

FIRST CAST IRON PLOW.—Some of the papers have been looking up the records for the name of the patentee of the first cast iron mold boards for plows. A correspondent of the New York Farmers' Club lately stated that it was to Jethro Wood, of New York, that the first patent was granted, and that it was about the year 1823. In contradiction to this, a Pennsylvania correspondent states that he cannot now tell the exact time, but in about the year 1798 a patent was granted to Robert Smith, of Bucks County, Pa., for mold boards of cast iron, and the plows were made by the inventor and his brother, Joseph Smith. This he believes was the first of the kind used in America. Thomas Jefferson's patent was granted near the same time the Smiths obtained theirs; Peacock's a year or two later.

PAINE & STEPHENS' IMPROVED CONCENTRATOR,

For Saving Gold and Silver Sulphurets.

This invention, a perspective view of which is given above, consists in applying machinery to the ordinary buddle, and rendering the same automatic in action. It is calculated to do a large amount of work.

One Machine, costing about \$1,400, is sufficient to work the Sands from 25 to 30 Stamps. But very little power is required.

It can be easily run by one man turning a crank. The principle on which it works is entirely dissimilar from any other machine now used on the Pacific Coast; although it is in almost universal use in Europe; but not so arranged there as to be automatic in action.

The illustration given herewith, was fully described in the Mining and Scientific Press of March 21, 1863.

One of these machines may be seen in constant operation at the Eureka (Watt's) mine in Grass Valley, where it is giving the fullest satisfaction, and is working all the tailings from thirty stamps. Another machine may be seen at the Banner mill, in Nevada, and a third below the Gould & Curry Company's mill, near Virginia City.

For further information, apply to **THOMAS N. PAINE**, Grass Valley, California.

PAINE & STEPHENS.

HANSBROW'S CHALLENGE

Deep-Well, Mining and Double-Cylinder Patent Pumps.

Six-Inch Mining Pump.

These Pumps combine all the advantages of the common Lift and the Double-Acting Suction and Force Pumps, and are equally fitted for all—Household, Farm, Mill, Manufactory, Brewery, Ship, Railway, Mining, and other purposes, and are especially recommended on account of their lightness, compactness, durability, cheapness, and the facility with which they can be placed in any position.

They are adapted for Hand, Steam, Horse, Water, or Wind Power. They are more durable in all their parts than any other Pumps of the same power.

Four-Inch Deep-Well Pump.

The Valves are of the simplest construction, and can be readily taken out by loosening two common nuts. They are not liable to get out of order, and can at all times be removed without the aid of a skillful mechanic.

The lever valves of these Pumps work upon inclined seats, which prevents sand or other matter that the Pumps may take up, from remaining under the valves, or stopping the flow of water.

These Pumps are worked with less friction, and consequently require less power than any other Double-Acting Pumps of equal capacity.

All sizes, from 2-inch to 8-inch Cylinder, manufactured by the Pacific Iron Works, GODDARD & CO., and for sale by the Agents,

The Huntington Patent Elastic Springs

THE UNDERSIGNED BEG LEAVE TO CALL THE ATTENTION of the public to a new and superior article of BEDS, LOUNGES, etc., manufactured by them, at 353 and 355 Tehama street, between Fourth and Fifth, San Francisco.

The Upholstering is done upon Huntington's Patent Elastic Spring, the superiority of which over all others will readily be seen on inspection.

If you want a comfortable and durable BED or LOUNGE, please call at the Factory, 353 and 355 Tehama street, or at Salesroom No. 613 Market street, opposite Montgomery, and examine our Spring Mattresses and Lounges, before buying elsewhere.
18v163m HUNTINGTON & TORREY.

Mining Secretary.

THE SUBSCRIBER, HAVING SERVED FOR THE LAST five years as Secretary of various mining companies, feels fully competent to serve in that capacity. Any parties wishing to secure the services of a Secretary can be accommodated on reasonable terms. Information given, and all necessary papers correctly made out. Having had a long experience in the purchasing of goods and machinery for miners, parties in the mines will find it to their advantage, where purchasing agents are employed, to send their orders to the undersigned.

SAN FRANCISCO

HYGEIAN HOME WATER CURE.

No. 637 California street, opposite St. Mary's Cathedral.

WE HAVE NOW THE MOST EXTENSIVE AND COMPLETE Health Institute on the Pacific Coast, both for ladies and gentlemen. The success which has attended industry and an honest persistence of this rational mode of curing the sick for the past ten years, has enabled Dr. Smith to establish a Home combining all the Hygienic appliances essential to the invalid. Owing to our increased facilities, we feel warranted in reducing the prices for gentlemen to \$30 per month; to ladies from \$16 to \$20 per week for board and treatment.

And Cocoanut Fiber for Upholstery.
South side Chestnut street, bet. Polk and Larkin streets,
SAN FRANCISCO.BY A PROCESS ENTIRELY NEW, THE PROPRIETOR
is now manufacturing in quantity sufficient to supply
the demands of the trade, A NEW AND SUPERIOR MATERIAL
FROM THE FIBER OF THE COCOANUT—the best
substitute for curled hair hitherto discovered—for mat-
tresses, chairs, lounges, and all upholstering purposes.
The following are some of the advantages which it pos-
sesses over all other materials used for the above named
purpose:
1st. It is cheaper, all things considered, than most arti-
cles in use.
2d. It is the best and purest material known in the
market, being entirely free from all offensive smell.
3d. It is the most durable, not being subject to rot after
years of exposure to moisture and dampness.
4th. It is remarkable for its elasticity, rivaling, in this
respect, the finest curled hair.
5th. It contains nothing to breed vermin or support insect
life, being entirely freed in process of preparation from all
deleterious vegetable matter.
Lastly, It does not pack; is free from dust; much lighter,
and in general overrules all the objections to pila, pre-
pared shavings, soap root, and other inferior substitutes for
leathers and hair. 22v16m

cific Mail Steamship Co's office, corner of Sacramento and
Leidesdorff streets.OLIVER ELDRIDGE, Agent.
By MAIL.—The Mining and Scientific Press will be sent by
mail to any part of the civilized world. In case of removal
subscribers have only to inform us of the post office address
of the old and new location, and the paper will be sent
accordingly.

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the mullor forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the
PACIFIC FOUNDRY,
141 San Francisco.

BLAKE'S QUARTZ BREAKER!

Next above Stuart and south of

Mission st., San Francisco.

Hunt's Patent Wind-Mills, Tread

Horse-Powers, Sweep Horse-Pow-

ers, (for one or four horses), Saw-

ing Machines, Pumps of all kinds

for shallow or deep wells, in-

cluding Hunt's Submerged Pump,

Hunt's Globe Pump, and Hunt's

Single and Double-Acting Pump.

Pumping Machines and general

Machinery kept constantly on

hand and built to order.

Also, Water Tanks of all sizes. Having put up large new buildings specially for my business, with greatly increased facilities in the way of room and steam power, I shall be able to build everything in my line at greatly reduced rates.

All desirous of procuring water for irrigating or other purposes, are invited to examine my articles before purchasing elsewhere.

2v16 E. O. HUNT, Proprietor.

OIL STOVES!

MORRILL'S

Petroleum and Universal Oil Stoves

Have proved themselves a superior substitute for Wood and Coal Stoves, in that they work quicker, are neater, make and burn better, and are more ECONOMICAL generally. They are portable, can be used in any room, with or without chimneys, as they emit no smoke, soot or ashes. There are nine different sizes, designed for all purposes, and other incandescent purposes—as well as for cooking. They are perfectly safe.

I now offer a reward of \$100 for every Petroleum Stove exploded by Naphtha delivered at my store, 13 Geary street, where they are for sale by

M. B. BULLARD,

Proprietor of Petroleum Stove for California, and Agent for Universal Oil Stove for Pacific Coast.

N. B.—Petroleum Stoves burn Naphtha converted into a gas. Universal Oil Stoves burn Naphtha, Benzine, or Coal Oil, with non-fluctuating flame and light on a wick as easy as a lamp.

Gold and Silver Ores.

BRODIE'S PATENT IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms: No. 1.—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price.....\$600 No. 2.—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour.....\$850 No. 3.—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour.....\$1,200 These Crushers have been erected at several mines in the State of Nevada, and others in Calaveras, Tuolumne and Mariposa counties, to whom applicants can be referred as being the most efficient, cheapest, and least weight compatible with strength and durability, of any Crusher yet erected.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers. A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—Diagrams and explanations afforded on application to the subscribers. A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866.

BRANCH HOTEL,

227 and 229 Second street, between Howard and Folson Sts., San Francisco. Late BRANCH HOTEL, Sutter St.

M. O'NEIL, Proprietor.

Single Meals.....25 cents. (Five Tickets.....\$1 00

Boarding and Lodging on reasonable terms. 2v16-1y

HOME-MADE BAROMETER.—The Boston *Journal of Chemistry* gives the following directions for constructing a cheap and efficient barometer:

Take two sheets of pasteboard of any convenient size, say three feet long by two feet wide. Bring the ends together and glue or paste them tight, each sheet by itself, and they will look like two pieces of paper stovepipe. Cut thin, round boards exactly to fit in the ends of these paper cylinders; carefully glue or nail them tight. Now you have two air-tight paper drums, with wooden heads. Take a pole of any length; let one drum be fastened to each end of the pole. Now balance this pole in the middle. Then bore a gimlet through the end of one drum, and you have a good barometer. One drum is air-tight; one has a hole in it; so there will be more or less air in one drum than there is in another, according as the surrounding air is dense or rarefied. Consequently, in dense or heavy air, the tight drum rises, while the one with a hole in it goes down. Have something you can slide through the bar, to keep it nearly level. Mark, if you please, figures along the pole, to show how far you have moved this.

UTILIZATION OF WASTE.—The following is from an article on the above subject in the London *Quarterly*: "Gas-tar, an ammoniacal liquor from the gas-works, not many years ago formed one of the most repulsive nuisances known to manufacturers. It was either thrown into the river, where it floated in ghastly blue patches, under the name of Blue Billy; or, as at Edinburgh, was conveyed away stealthily at night, and emptied into the sea. These offensive products have within these last few years been distilled and transferred into a number of liquids and solids, all of which are more or less valuable. The gas-tar, a material with soiling powers unequalled, and with an odor that is unapproachable, yields benzol, an ethereal body of great solvent powers, which forms the principal constituent of 'benzine,' the most effectual remover of grease stains known, and generally used to renovate kid gloves. Benzol produces, with nitric acid, nitro benzol, a body resembling in odor bitter-almond scent, which is largely employed in perfuming soap. Could any two products appear more antagonistic to the substance from which they spring?"

GLAZING IRON VESSELS.—Of the various materials proposed for this purpose, says the *Artisan*, a mixture of oil and minium of iron (peroxide of iron mixed with alumina) is entitled to preference. After having thoroughly pulverized the minium, it is mixed with linseed oil, rendered pasty with manganese. This mixture is applied to the iron surfaces after these have been carefully cleaned, and deprived of rust by means of pumice-stone.

The same journal has the following: A recent English patent for "improvements in the production of a glazed or vitrified surface on cast iron or other cast metal" sets forth the following method: In producing castings of iron or other metal, the mold and any core which may be employed, or either or part thereof, is coated with powdered glass, or it may be furnace cinder or enamel, or other material capable of being vitrified by the heat of the melted metal when it is poured into the molds, so as to form a glaze or enamel on the surface of the casting.

BLACK DYE FOR WOOL.—A valuable aniline dye for wool of a beautiful solid black, which resists all the agents that usually discharge the color of black cloth, has just been announced. The yarn or cloth is first steeped for an hour in a bath nearly at boiling heat, composed of two pints of water, seventy-five grains dichromate of potassa, forty-six grains sulphate of copper, and thirty-one grains sulphuric acid. After this the material is well washed, and then plunged in a solution of oxalate of aniline of one or two degrees of Beaume's hydrometer.

MEXICAN SILVER MINES.—A mine in the neighborhood of Charcas, worked at an expense of \$170,000, since the first of January, 1861, has yielded silver during that time to the value of \$5,460,000. The Santa Rosa Mining Company is drawing out \$95,000 worth of ore per week. Its works employ 460 hands, at the rate of thirty-seven cents per day, and the expenses amount in the aggregate to about five per cent. of the value of the silver taken out.

The boilers of the Trinidad lumber mills exploded on the 15th instant, killing one man and wounding several others.
